SUMMARY OF SUBJECT MATTER
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
HEARING ON INFRASTRUCTURE NEEDS
2167 RAYBURN HOUSE OFFICE BUILDING
THURSDAY, MARCH 29, 1990

The condition of our infrastructure is one of the most important issues facing the Nation, for the public works facilities of every county, city, community and neighborhood provide the basic support for all aspects of our economy---for growth of private productivity, for our ability to compete successfully in international markets, and for the present and future quality of life and standard of living of every one of us.

It is widely recognized that problems with our infrastructure are moving ever closer to a crisis stage, putting our Nation's future in jeopardy.

CAPITAL SPENDING

From 1960 to 1985, total public spending on infrastructure dropped from 3.6 percent of the gross national product to 2.6 percent. The relative share of public works spending at all levels of government declined from nearly 20 percent of total expenditures in 1950 to less than 7 percent in 1984. The Federal share of infrastructure spending has declined from 41 percent in 1981 to 34.5 percent in 1986.

State and local governments and special districts share responsibility with the Federal government for providing necessary public works facilities. But, the problems at the State and local levels are aggravated by conflicting demands for few available funds and compounded by reduced Federal funds, including abolishment of the general revenue sharing program, which returned $4 billion to local governments, and Federal government enactment of costly mandates and regulatory programs for states and localities to enforce while restricting the resources available to fund the programs. In addition, proceeds of the transportation trust funds are not being fully invested and substantial amounts remain in the two funds and changes in the tax laws have made it more difficult for States and localities to issue tax-exempt bonds for public works projects.

XVIII

NEEDS

If we do not change our current approach and increase capital spending, our American standard of living and quality of life will be seriously threatened.

Our population is expected to increase by 44 million people over the next thirty years and will add to the existing pressures on our overburdened public works facilities. Metropolitan areas account for three-fourths of the total population with more than forty percent of Americans living in the suburbs.

The decline in investment is having a tremendous impact on infrastructure systems and the economy:

Highways:

- From 1980 through 1988, traffic growth increased at an average rate of 5% annually.

- Urban traffic congestion has increased by 50 percent over the last 10 years. A worker delayed 20 minutes each day in rush hour traffic will waste two working years by the end of his or her career.

- In 1984, 1.4 billion gallons of gasoline was wasted due to congestion; by 2005, waste could soar to 7.3 billion gallons.

- Over 60 percent of the Nation's highways need work. Continuing current levels of highway funding will result in further deterioration of our highway system. It is estimated this will cost each household $1,000 annually in operating costs.

- Transportation costs represent about 15 to 30 percent of the landed price of agricultural exports.

Bridges:

- Inadequate bridges are one of the Nation's most pressing infrastructure problems. 41 percent of the Nation's 600,000 bridges are either structurally deficient or functionally obsolete.

Air Transportation:

- No new airports have been constructed in the U. S. since 1974.

- Revenue passenger miles flown has increased an average of 8.9% annually over the past 10 years, severely straining the Nation's air transport system. Air passenger growth is projected to double by the year 2000.

- In 1986, schedule delays on the Nation's airlines exceeded 2,000 hours per day---the equivalent of grounding 200 aircraft daily.

Clean and safe environment:

- Estimates reflect that some 10,835 wastewater treatment facilities (of a total 15,591) have documented water-quality or public health problems; that about 28 percent of randomly selected large municipal water systems had detectable levels of one or more volatile organic chemicals in the ground-water supplies; that 450,000 tons of solid waste are being generated every day, 95 percent of which are being disposed of in landfills reaching disposal capacity; and that approximately 30,000 potentially contaminated hazardous waste sites may pose a threat to human health or the environment.

HEARING AGENDA

Congressmen Gephardt and Gingrich will provide valuable testimony based on their experience and knowledge of the Nation's needs.

Major General Kelly of the Corps of Engineers is expected to 1) summarize and review key conclusions, findings and methodologies of the studies listed below (copies of executives summaries are attached) and 2) touch on other areas not addressed in Needs Studies.

- "Hard Choices", the National Infrastructure Advisory Committee's report to the Joint Economic Committee, February 1984;

- "America's Infrastructure: A Plan to Rebuild", The Associated General Contractors report of May 1983;

- "Public Works Infrastructure: Policy Considerations for the 80's", Congressional Budget Office report of April 1983;

- "Fragile Foundations: A Report on America's Public Works", final report of the National Council on Public Works Improvement, February 1988.

John Horsley, Chairman, Board of Commissioners of Kitsap County, Washington will represent the Rebuild America Coalition. It is a broad coalition of about 50 public and private organizations committed to the infrastructure challenge and the need to protect America's investment in the entire range of public facilities. It includes the mayors, city councilmen and other public leaders whose job is to maintain, inspect and plan for building and rebuilding our public facilities. They are supported by the engineers, builders, financiers, contractors and architects who are dedicated to the highest standards of quality, safety and cost effectiveness. Among other things, the Coalition prepares reports that address various elements of America's infrastructure problems and solutions to those problems.

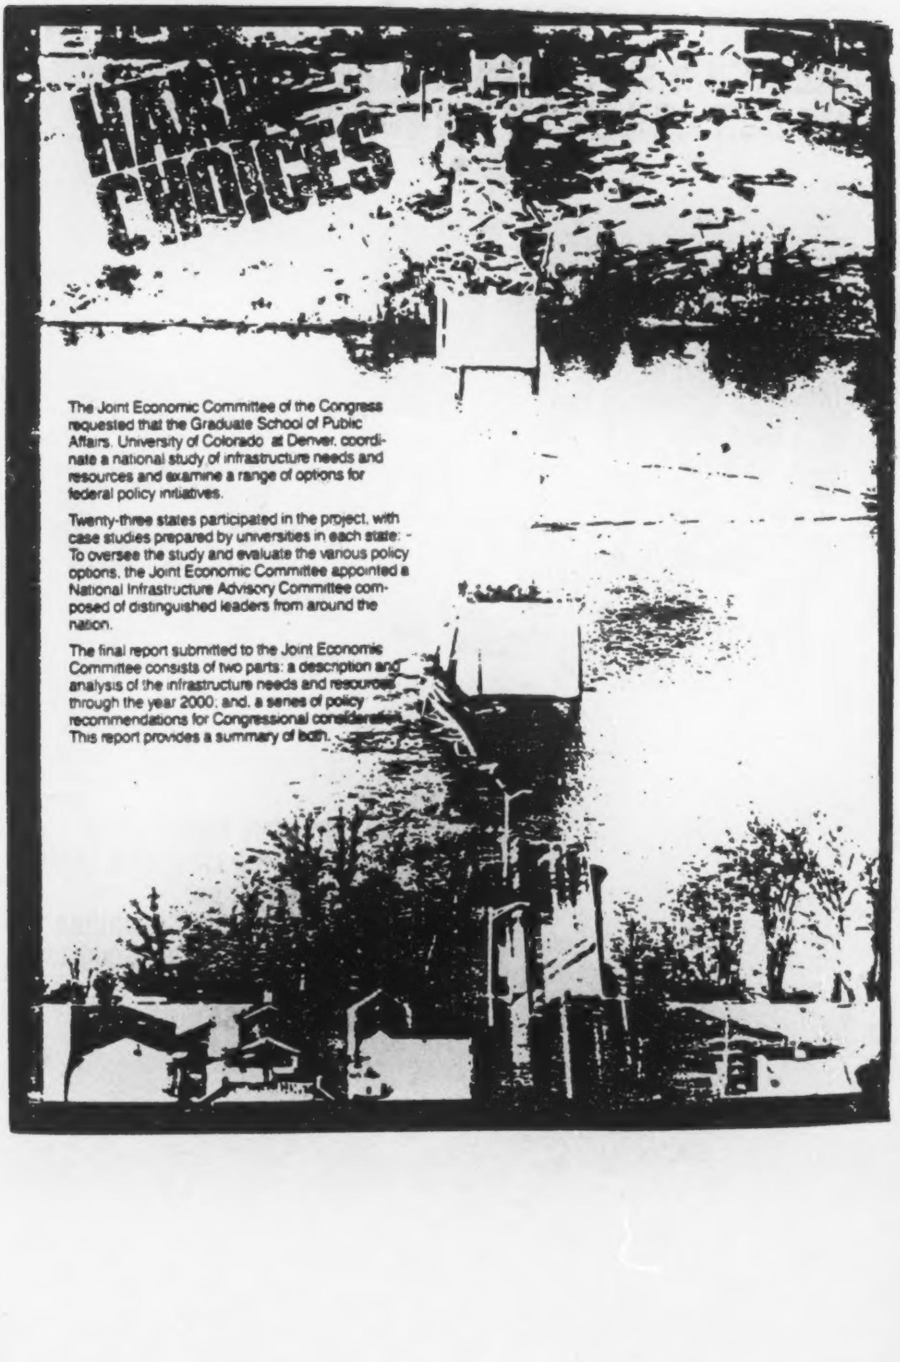
Mr. Horsley is expected to focus on infrastructure problems in the States and to provide a film presentation and graphics displaying pertinent data on infrastructure needs.

A REPORT ON THE INCREASING GAP BETWEEN AMERICA'S INFRASTRUCTURE NEEDS AND OUR ABILITY TO PAY FOR THEM

HARD CHOICES

A Summary Report of the
National Infrastructure Study
Prepared for the
Joint Economic Committee
of the United States Congress

February 1984



HARD CHOICES

The Joint Economic Committee of the Congress requested that the Graduate School of Public Affairs, University of Colorado at Denver, coordinate a national study of infrastructure needs and resources and examine a range of options for federal policy initiatives.

Twenty-three states participated in the project, with case studies prepared by universities in each state. To oversee the study and evaluate the various policy options, the Joint Economic Committee appointed a National Infrastructure Advisory Committee composed of distinguished leaders from around the nation.

The final report submitted to the Joint Economic Committee consists of two parts: a description and analysis of the infrastructure needs and resources through the year 2000; and, a series of policy recommendations for Congressional consideration. This report provides a summary of both.

NATIONAL INFRASTRUCTURE ADVISORY COMMITTEE TO THE JOINT ECONOMIC COMMITTEE OF CONGRESS

Chairman

Honorable Henry S. Reuss
Former Chairman, Joint Economic Committee
Chapman, Duff & Paul
Washington, D.C.

Vice Chairmen

Mr. Peter C. Goldmark, Jr.
Executive Director
The Port Authority of N.Y. & N.J.
New York, N.Y.

Mr. Lee White
Vice President & Manager
Denver Office
Smith Barney Harris Upham & Co.
Denver, Colorado

Committee Members

Mr. Roy Bahl
Director, Metropolitan Studies Program
Syracuse University
Syracuse, N.Y.

Mr. C. Phillip Baumel
Professor
Agricultural Economics
Iowa State University
Ames, Iowa

Mr. Michael Brewer
Director of Government Relations
& Public Affairs

TRW, Inc.
Washington, D.C.

Mr. Peter M. Dawkins
Managing Director
Lehman Brothers Kuhn Loeb, Inc.
New York, N.Y.

Honorable Michael Dukakis
Governor of Massachusetts
Boston, Massachusetts

Mr. Robert Georgine
President
Building & Construction Trades
Washington, D.C.

Mr. Hyman Grossman
Vice President, Municipal Rating
Standard & Poors Corp.
New York, N.Y.

Honorable William Hobby
Lt. Governor of Texas
Austin, Texas

Honorable Thomas H. Kean
Governor of New Jersey
Trenton, New Jersey

Mr. Thomas Klutznick
Miller Klutznick Davis & Gray
Chicago, Illinois

Ms. Juanita Kreps
Former U.S. Secretary of Commerce
Duke University
Durham, N.C.

Honorable Richard D. Lamm
Governor of Colorado
Denver, Colorado

Mr. Peter Lewis
Partner
Lazard Freres
New York, N.Y.

Ms. Jane McGrew
Steptoe & Johnson
Washington, D.C.

Mr. Raymond Nasher
Chairman
Nasher Co.
Dallas, Texas

Honorable John Mutz
Lt. Governor of Indiana
Indianapolis, Indiana

Mr. George Peterson
Director, Public Finance Center
The Urban Institute
Washington, D.C.

Mr. Leland S. Prussia
Chairman of the Board
Bank of America
San Francisco, Ca.

Honorable Charles Royer
Mayor
City of Seattle
Seattle, Washington

Mr. George Schrader
L.D. Brinkman & Co.
Dallas, Texas

Honorable Ted Schwinden
Governor of Montana
Helena, Montana

Honorable John Spellman
Governor of Washington
Olympia, Washington

Honorable Mark White
Governor of Texas
Austin, Texas

Mr. John Wiedeman
President

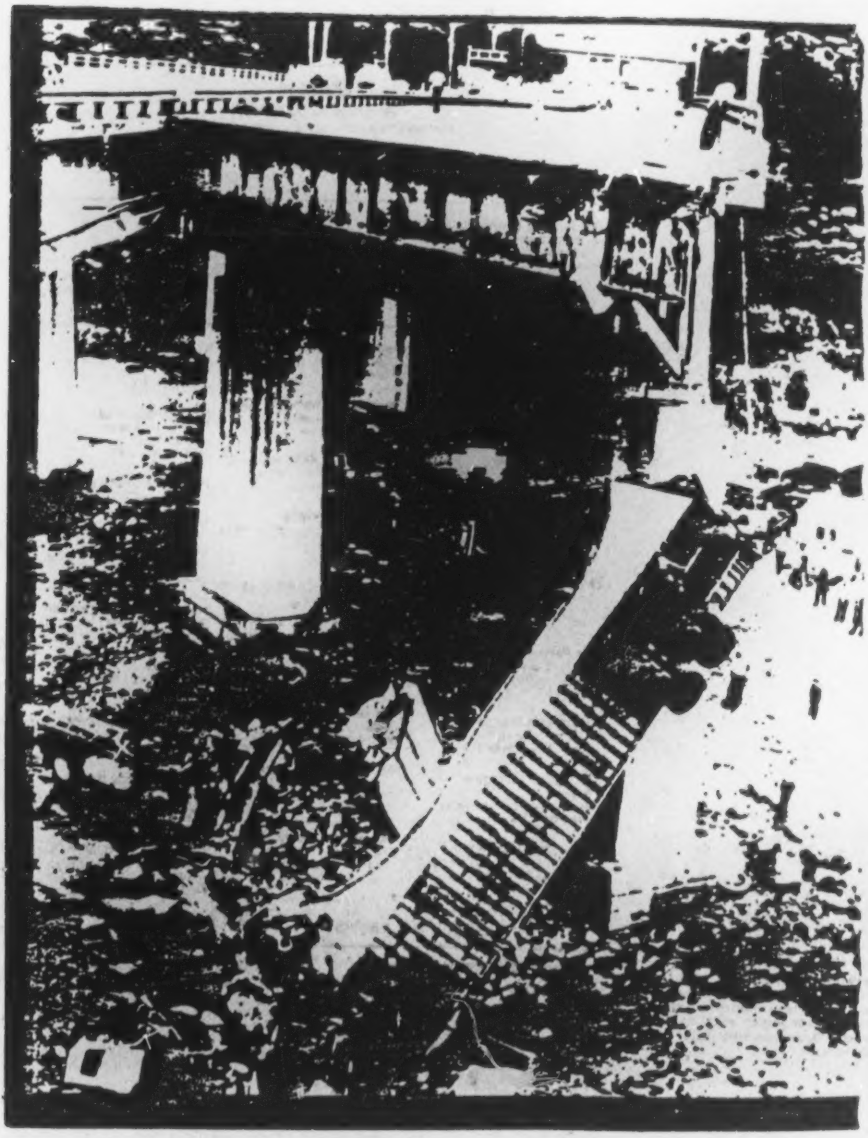
The 1967 collapse of the Silver Bridge between West Virginia and Ohio was instrumental in the establishment of the federal bridge inspection program which, in turn, revealed a national problem of major proportions.

XXIV



HARD CHOICES

The word "infrastructure" is a term that describes the basic network of facilities that drive our economy: our transportation, water and wastewater systems.

The word "infrastructure" is a term that describes the basic network of facilities that drive our economy: our transportation, water and wastewater systems.

As many frustrated public officials have observed, people generally don't care about the state of the nation's infrastructure.

Perhaps.

But people *do* care when a major highway caves in due to disrepair, paralyzing part of the transportation system of a major city.

People *do* care when a water storage system is so archaic and overtaxed that the slightest trauma causes it to collapse, leaving thousands without running water.

People *do* care, when for lack of adequate roads and water facilities, major industries move away from the community, leaving hundreds without jobs.

In an era of competition for limited public resources, it has become expedient for public officials to delay necessary capital improvements, to eliminate expenditures for maintenance, and allocate these funds to other, more immediate needs.

But, inexorably, hundred-year-old water lines are quietly deteriorating, bridges and roadways are approaching the end of their designed life, and changes in population patterns are placing enormous stress on systems in high-growth states.

When a system that all citizens rely upon and take for granted collapses, or is inadequate to meet future needs, the impact is far greater than an engineering problem in search of a solution. It creates a sense of public unease, a belief that society is incapable of handling its most basic needs. In this sense, people *do* care, very passionately, about the state of the nation's infrastructure. And in referenda this past fall across the country, people showed they cared by voting at the ballot box for a near record proportion of capital programs to develop and rebuild their life support systems.

Yet, the inability to adequately address the infrastructure needs of the nation constitutes a major problem that seriously threatens our economic and physical well-being.

But, inexorably, hundred-year-old water lines are quietly deteriorating, bridges and roadways are approaching the end of their designed life, and changes in population patterns are placing enormous stress on systems in high-growth states.

With virtually every level of government facing either major revenue shortfalls or significant unmet needs, the temptation to further postpone addressing this situation is great. It is time to measure the need, to understand that investment in our capital stock must be a priority to help keep our economy competitive and sustain our quality of life, to support the efforts of state and local governments to mobilize and finance infrastructure programs and to define what the role of the federal government in this national effort should be.

This report suggests that some hard choices have to be made, today, about meeting our nation's infrastructure needs of the future. There's a bill coming due. We should start to pay now, or we'll have to pay a lot more later.

A MANAGEABLE CRISIS

That a substantial portion of the nation's basic, publicly-financed infrastructure systems is inadequate is no longer a matter of debate.

Some observers, defining the problem at its most extreme, place the costs of restoring and expanding the current network of systems as high as three trillion dollars ($3,000,000,000,000), a figure so enormous as to make the entire problem seem absurd.

The assumption behind the recommendations in this study is that *the nation which built the greatest network of roads and waterworks in the world has not suddenly become incapable of maintaining and improving such a system.*

By setting priorities, by defining the problem in realistic terms, by utilizing the resources of federal, state and local governments, and by invoking the historic partnership between public and private sectors that helped build this great system, an approach to dealing with the revitalization of our infrastructure can be developed that is neither prohibitively expensive nor unmanageable.

This report has made no attempt to minimize the scope of the problem. *But it has also not minimized the creativity and resources available to develop a long-range, workable solution.*

The bottom line is that the problem is solvable, that the solutions are manageable, and that the time to start is now.

THE SCOPE OF THE PROBLEM

This report, two years in the making, is not the first to address the nation's infrastructure needs. It breaks new ground, however, because of its focus on state and regional needs and because of its effort to aggregate these needs into national totals through the year 2000. The report clearly demonstrates that infrastructure problems are common to *all* regions of the country.

The bottom line is that the problem is solvable, that the solutions are manageable, and that the time to start is now.

To obtain this state and regional viewpoint, twenty-three states were studied to determine their current levels of needs and expenditures in four key areas: wastewater collection and treatment, water supply and delivery, roads and bridges, and other transportation facilities (mass transit, airports, etc).

Additionally, the states were surveyed concerning their future needs, up till the year 2000, and their projected capital sources.

The results of this survey pointed to several noteworthy conclusions:

1. The problem is *national in scope*. It is not limited to any region or state.
2. The problem is *manageable*.
3. The problem requires *state and local governments to continue to assume primary management and funding responsibilities*.
4. The problem requires a *long-term response and commitment by the federal government*.

A NATIONAL PROBLEM

The total national infrastructure gap between revenues and needs through the year 2000 is over $400 billion. It stems from many different kinds of problems in the various states and regions. For example:

- In Oklahoma, water from the Ogallala Aquifer is being consumed for agricultural use faster than nature can replenish it.
- In Maine, 63 per cent of the highways are determined to be in need of immediate improvements.
- In Alabama, 53 per cent of the county maintained bridges are structurally deficient or functionally obsolete.
- In Oregon, only 14 per cent of the population is served by facilities providing secondary wastewater treatment.

In state after state, the immediate and projected infrastructure needs are considerable, and the gap between capital expenditures and capital needs is growing.

Clearly, we are witnessing a problem that is national in scope.

But within each region, and even within each state, the needs and the scope of the problem differ significantly.

In many of the older industrial areas of the nation, deterioration and obsolesence of existing systems threaten the opportunity for long-term economic revitalization.

For the rapidly-growing areas, the infrastructure gap stems from the demands placed by an ever-growing population.

But while the problems may differ, the gap between needs and financial resources in all areas of the country is substantial.

In state after state, the immediate and projected infrastructure needs are considerable, and the gap between capital expenditures and capital needs is growing.

PROJECTED U.S. INFRASTRUCTURE NEEDS, RESOURCES AND SHORTFALLS 1983-2000

(in billions of 1982 dollars)

	NEEDS	RESOURCES	SHORTFALLS
HIGHWAYS AND BRIDGES	$ 720	$455	$265
OTHER TRANSPORTATION	178	90	88
WATER SUPPLY AND DISTRIBUTION	96	55	41
WASTEWATER COLLECTION AND TREATMENT	163	114	49
TOTALS	$1,157	$714	$443

Transportation

Of the nation's 565.000 vehicular crossings, some 45%, are deficient or obsolete.

The single most dominant need across the country is for investment in highways and bridges. The construction of much of the nations highway network over the last several decades has been funded largely by the federal government. However, much of the nation's highway mileage is not on the federal-aid highway system and responsibility for reconstruction and maintenance of the entire network has largely been shouldered by state and local governments. This total highway network is aging. The needs facing state and local governments are growing, as evidenced by the fact that more than one half of the nation's two million miles of paved roads require immediate attention and over one third of the Interstate highway system is in need of repair.

While the nation's highways show substantial need, bridges pose an especially serious problem. Of the nation's 565.000 vehicular crossings, some 45% are either deficient or obsolete. These problem bridges exist throughout the country. The Federal Highway Administration estimates that in 34 states at least one third of the bridges require substantial renewal.

As a result, the projected highway and bridge needs through the year 2000 approach $720 billion. Even though federal and state gas tax levies have been increased in recent years, the projected shortfall is estimated at $265 billion.

On a regional basis, the greatest highway needs are projected for the Midwest. But the needs in all regions are substantial.

An increasing number of communities around the nation are looking to existing or planned public transportation facilities to move high volumes of people to growing business areas, both as a way to reduce highway congestion and to support economic development efforts. Costs here are also high and resources scarce.

...communities around the nation are looking to ...public transportation ...as a way to reduce highway congestion and to support economic development efforts.

Water Supply and Distribution Systems

Developing reliable expenditure figures for water storage, treatment and distribution is complicated by the variety of entities providing these services. In New Jersey, for example, a large share of the responsibility for water delivery is assigned to private water companies. Washington State has over 8000 separate water systems, while Massachusetts has 363 separate water supply systems, of which 68 are private companies, 78 are fire and water districts, and 217 are municipal water departments.

Regardless of the type of organization relied upon, certain common problems were identified:

- Deterioration of water supply and distribution systems
- Inadequate sources of water supply
- Overdrafting of underground aquifers
- Contamination of water supply
- Inadequate treatment facilities.

Overall, water needs are projected to be nearly $100 billion through the year 2000, suggesting a shortfall in available capital of more than $40 billion.

On a regional basis, increasing water supply is the predominant concern of the South-Central and Western regions, while the Northeast and Midwest need to protect their supplies and rebuild aging distribution systems.

Wastewater Collection and Treatment

Since the passage of the Federal Water Pollution Control Act of 1972, the Environmental Protection Agency has been actively involved in assessing sewerage collection and treatment needs.

EPA's assessment process categorizes both backlogged needs (cost required to deal with existing pollution problems) and year 2000 needs (based on future population growth). Many states rely on EPA-derived figures to determine their sewerage treatment needs. Several states, however, believe that the EPA evaluation method may understate the dimension of the problem since all categories of need are not necessarily included.

Based on the figures reported by the states, the overall national need by year 2000 is projected at nearly $165 billion, and the anticipated shortfall in the neighborhood of $50 billion.

The greatest needs to accommodate today's population are in the Northeast and Midwest regions, but the population growth in the West and Sunbelt states is increasing the pressure to expand capacity in those areas.

Upper photo: Overdrafting of ground aquifers can result in the calamity of subsidence.

Lower photo: Inadequate sewage and stormwater collection systems often cause backups and destructive flooding conditions.

THE STATES' DILEMMA

While all the states surveyed projected substantial revenue shortfalls meet their specific infrastructure problems. their abilities to cope with th challenges differ significantly.

At the most basic level. many states are only beginning to devise a coher comprehensive approach to identifying their capital needs and developi plan to meet these demands.

Capital planning is further complicated by restrictive laws and regulati governing each state as well as by constraints imposed by the fede government.

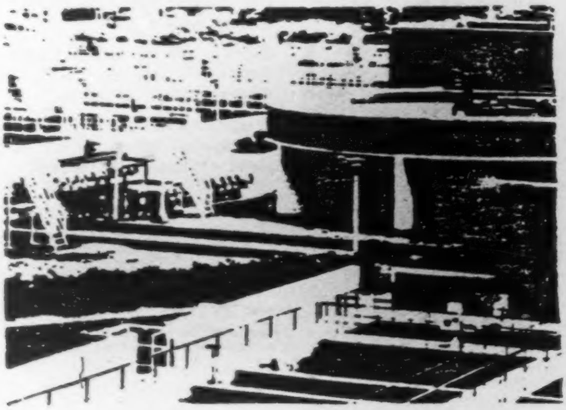
Some examples:

- Many states have statutory or constitutional debt and tax limitations t constrain funding available for long-term projects.
- Ambiguity about the federal government's role in infrastructure dev opment impedes efficient infrastructure planning and developm strategies.
- Uncertainty about proposed modification of tax-exempt bond mech nisms makes it difficult to develop cost-effective financing strategies capital construction.

One important problem is the varying capacity of states to cope with th infrastructure problems due to the health of their local economies. T creates a Catch-22 effect. Many state and local governments that cou benefit most from economic development opportunities by building mo efficient transportation, water and wastewater systems lack the fiscal capa ity to initiate these projects on their own.

To solve this dilemma, it will take the collective effort of all levels of gove ment and the private sector to put in place the necessary planning a financing mechanisms.

Many state and local governments that could benefit most from economic development opportunities by building more efficient transportation, water and wastewater systems lack the fiscal capacity to initiate these projects on their own.



THE FEDERAL RESPONSE

BRIDGE
CLOSED

State and local governments should, and undoubtedly will, continue to have the primary role in infrastructure management, financing and development. But it must be recognized that the federal government, by setting construction standards, by co-financing projects, by setting tax policy, and by defining needs, to a large extent influences the options available to the states.

And from the states' perspective, the federal government's policies toward infrastructure development are a source of considerable uncertainty and confusion.

With these considerations in mind, the Advisory Committee proposes that Congress address the question of federal infrastructure policy using the following guidelines:

1. Federal policy should recognize the inter-relationship between infrastructure development and the attainment of national economic goals.

In other words, federal assistance is appropriate when state and local governments by themselves have insufficient capital capacity to finance infrastructure projects that are essential to fulfilling national goals concerning economic competitiveness, productivity and basic quality of life.

2. Federal policy should recognize the implications of federally-initiated mandates for state and local governments.

The federal government sets standards in areas like clean water and interstate highway maintenance. Fairness suggests that the federal government continue to play a role in providing financial assistance in areas where the states must shoulder additional expenses to meet uniform national standards.

...federal assistance is appropriate when state and local governments by themselves have insufficient capital capacity to finance infrastructure projects that are essential to fulfilling national goals...

3. Federal policy should recognize that infrastructure problems are not confined to state boundaries.

Water pollution and traffic congestion do not respect state lines. Quite often, infrastructure problems are regional in scope and require regional solutions. Developing regional solutions is an appropriate area for federal involvement.

The Need for a Policy

Though Congress is cognizant of the infrastructure problem and has moved in several functional areas to respond, a clearly articulated, long-term federal policy on this issue would provide an improved climate for state and local infrastructure planning and investment.

The following recommendations, drawn from this study, are intended to help Congress deal with this vital issue.

XXXII

Recognizing the growing interest in Congress to address these critical national problems, and at the same time recognizing the need to live within our fiscal realities, the National Infrastructure Advisory Committee is urging Congress to consider four basic recommendations for modifying the current federal approach to infrastructure development. These recommendations are designed to expand the resources available for infrastructure and to improve our ability to manage capital programs at all levels of government.

■ **RECOMMENDATION I:** Congress should establish a "National Infrastructure Fund" to supplement resources available under existing federal, state and local infrastructure capital programs.

■ **RECOMMENDATION II:** Congress should mandate the creation of a coordinated national infrastructure needs assessment program and, within the unified budget, require that capital expenditures be presented and highlighted in a clear, comprehensive way.

■ **RECOMMENDATION III:** Congress should initiate a review of technical standards now governing construction of the nation's roads, bridges, transit systems, water and wastewater facilities.

■ **RECOMMENDATION IV:** Congress should carefully re-evaluate the statutory and administrative rules that govern the use of existing federal infrastructure assistance programs.

Implementation of these four recommendations would pave the way for an effective partnership between the federal government and state and local governments to meet the infrastructure challenge and enhance the competitiveness of the national economy between now and the year 2000.

National Infrastructure Fund capital resources could be used to help rehabilitate existing infrastructure

RECOMMENDATION I: CREATING NEEDED CAPITALIZATION MECHANISM

The infrastructure capital needs identified by the National Infrastructure Study are significantly larger than the resources expected to be available. Therefore, any realistic approach to meeting these needs will invariably require an increased level of commitment from all levels of government. Within that context, the Advisory Committee examined a number of different approaches for increasing the level of federal financial support. They ranged from simply increasing the level of current grant programs to encouraging innovative public private mechanisms to establishing new funding partnerships with state and local governments. (Some of these approaches have already been presented to Congress in previous sessions and deserve further consideration.) The approach most favored by the Advisory Committee calls for the creation of a new National Infrastructure Fund.

National Infrastructure Fund (NIF)

The use of tax-exempt bonds and pay-as-you-go financing are the traditional methods by which state and local governments fund capital construction programs. These financing methods, however, are not adequate to meet current infrastructure needs, not to mention the challenge of the future projected needs described in this report. Increasingly, state and local government capital budgets are strained by competing demands, high real interest rates, statutory and constitu-

tional debt limitations and, in some instances, the realities of fiscal capacity. New ways of raising capital funds have to be found.

A new federally-chartered National Infrastructure Fund would raise money by selling taxable bonds directly in the private market or through the Federal Financing Bank. It would leave undisturbed the financial resources of the tax-exempt capital market. Congress would determine NIF's ultimate size and scope.

The revenue created would be used to capitalize state infrastructure financing institutions, such as state infrastructure banks. These entities would then provide funds to support state and local infrastructure programs.

If Congress provided for the payment of interest on the NIF debt, then NIF could provide the states with interest-free capital. States could then finance, on a revolving fund basis, specific infrastructure projects chosen by state and local officials from among eligible infrastructure categories, e.g., roads, bridges, mass transit, water and sewer. The actual assistance could be accomplished in a variety of ways, using a range of interest rates or other financing mechanisms.

The capital provided by NIF ultimately would be repaid by state and local governments from taxes or user fees. But until the bonds issued by NIF came due for repayment, state and local government units could recycle NIF capital to fund additional projects.

Because state and local governments would ultimately provide the funds to repay the NIF debt, the primary cost to the federal government would be the payment of the interest expense. And as this debt would not be tax-exempt, the federal treasury would not be deprived of taxes on the interest paid.

This approach would permit a large program of infrastructure projects to be financed within the constraints of the federal budget. It would provide the nationwide infrastructure effort with a sustained, predictable multi-year level of federal financing.

or NIF could finance new infrastructure for rapidly growing areas

RECOMMENDATION II: BUILDING AN ASSESSMENT AND CAPITAL BUDGETING CAPACITY AT THE FEDERAL LEVEL

Clogging of pipes and spalling of bridge support piers are two forms of infrastructure deterioration that go unnoticed by most

A major obstacle to developing a coherent approach to solving the infrastructure problem is that no one has known, with any degree of accuracy, the magnitude and nature of the needs nor the extent of the resources devoted to capital development programs. No forum currently exists for examining and debating, in a comprehensive way, how the federal government should support capital construction efforts and how the need for capital infrastructure investment should weigh against other claims on the public fisc.

For example, current budgeting practices hide direct and indirect federal infrastructure contributions, blur federal infrastructure objectives, and make it difficult, if not impossible, to assess the full impact of federal actions in this area. The extremely fragmented information base at all levels of government further compounds this situation.

As one would expect, these circumstances inhibit implementation of coordinated and efficient management and investment strategies at the federal level. They also make it difficult for state and local governments to mesh their short and long range plans with federal infrastructure actions.

How can we develop improved federal capacity? The Advisory Committee recommends the creation of a national infrastructure inventory and assessment process and the preparation of an annual analysis of federal capital expenditures.

Assessing Needs

The findings of this study on state and regional needs are considered threshold estimates, a base on which to build a continuing and more refined national assessment process.

The type and quality of available data gathered during this study varied considerably as did state-by-state definitions of needs and resources.

To establish a truly consistent measure of needs on a national scale, common definitions and consistent methodologies will be needed. Congress should foster development of a national assessment process that can accurately and continuously monitor changing needs and changing circumstances.

Within the context of basic national criteria, state-by-state information should be collected on a regular and systematic basis and provided to the Congress in the form of an annual infrastructure audit.

Federal Budget Capital Expenditure Analysis

No easy, clear way now exists to measure the full extent of federal commitment to infrastructure investment. The federal government, through a variety of investment strategies, provides considerable support for infrastructure development. But it is impossible to determine which approaches are most effective. The Advisory Committee urges Congress to assure that capital expenditures are separated from current operation outlays within the unified federal budget. Congress can then debate and set capital priorities clearly and deliberately.

This would be the first step in a process of analyzing federal infrastructure expenditures within the context of the overall capital policy objectives established by Congress.

This is not a new concept, but it has yet to be implemented. Failure to put the federal budget in a more rational, understandable order will limit the ability of state and local governments to define and move forward with their own infrastructure strategies.

Undermining of roadways can occur without warning and lead to major disruptions.

RECOMMENDATION III: RE-EVALUATING STANDARDS

In order to participate in most federal-aid programs for capital infrastructure development, states and localities must comply with stringent federally-mandated technical construction standards. In many cases, they stretch out construction schedules and add to costs.

Perhaps this is appropriate when the "Feds pick up the bill." But in some situations these standards appear unreasonable and unrelated to local needs. Unquestionably, they have an impact on the overall cost of a given construction project.

The historical development of these federal infrastructure standards, while in the health and safety interests of the nation, has been determined more by interested professional groups than by consumers.

Concern for public safety, quite properly, has to be a principal justification for these mandated standards. But weight should be given to other considerations such as the economic, social and environmental costs.

The Advisory Committee urges Congress to initiate a comprehensive study of federal standards governing development of basic infrastructure programs, using a prestigious and neutral body such as the National Academy of Sciences.

Concern for public safety ... has to be a principal justification for these mandated standards.

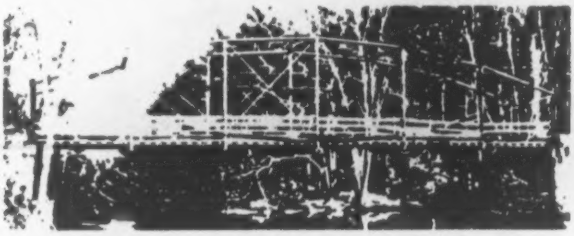
The study would measure the relevance of current mandated standards in light of changing social values and real resource constraints.

The study should:

- inventory federal standards in key infrastructure categories;
- analyze the relationship of these standards to those employed by state and local governments;
- evaluate the impact these standards have on the costs of infrastructure projects; and
- analyze the opportunity costs as well as the health, safety and environmental risks associated with reducing or changing standards.

But weight should be given to other considerations such as the economic, social and environmental costs.

The bill for infrastructure development is high enough without having to pay for facilities which are designed to standards which may no longer be appropriate. This undertaking might help reduce the gap between state and local needs and anticipated revenues.



RECOMMENDATION IV: DEVELOPING MORE FLEXIBLE GRANT PROGRAMS

In the course of developing these recommendations, the members of the Advisory Committee listened to the concerns of many governors and mayors. A common theme was the need for a review of the guidelines and laws governing existing federal grant programs.

Clearly, many would prefer maximum flexibility with respect to the use of federal funds. Some of the concerns expressed included:

–"We should not be limited to historically defined infrastructure categories...we should be able to use the total provided in a manner responsive to our needs and priorities and not Washington's."

–"We cannot use some grant programs easily as loans. We cannot allocate funds in some programs to readily leverage private sector monies...We are pressured to use or lose funds."

–"While we have more flexibility than in the past...federal infrastructure programs...still favor construction over maintenance activities."

Faced with these expressions of frustration and concern, an important strategy for Congress to consider would be a re-examination of the statutory and regulatory constraints inhibiting efficient state and local government use of existing infrastructure assistance programs. This could help to move projects faster and thus lower overall costs.

In an era of scarce resources at all levels of government, easing the restrictions on the use of these funds, within general statutory guidelines, could free up existing funds and increasingly allow them to be used to address state and local priorities.

The Advisory Committee has endorsed the general principle that state and local governments should be permitted greater latitude with respect to the use of existing grant funds.

...federal infrastructure programs...still favor construction over maintenance activities.

"Safe-harbor" leasing of transit vehicles provided substantial and sorely needed benefits to many public transportation operators

SOME THOUGHTS ABOUT TAX REFORM

State and local governments rely principally on funds raised through the tax-exempt market to finance capital infrastructure investments, using general obligation bonds, revenue bonds and industrial development bonds (IDBs). In recent years, Congress has become increasingly concerned about the growing use of IDBs for what may be considered private purposes. Legislation is currently under consideration that not only would severely restrict the use of IDBs for all purposes but would place arbitrary "cap" limitations on tax-exempt issues.

The Advisory Committee believes that it is desirable to limit the use of tax-exempt bonds to truly legitimate public purposes. In this context, however, no arbitrary restrictions should be placed on the scope, dollar value or character of tax-exempt issues that clearly respond to public policy concerns, particularly those related to the provision of basic infrastructure.

STATE AND LOCAL CONSIDERATIONS

The dominant focus of this report has been on changes to federal infrastructure policy.

But this report would be less than complete if it did not acknowledge some of the areas where state and local governments could improve the way they approach infrastructure investment.

Many of the states are suffering from unrealistic and overly-constrained attempts to manage budget issues through the use of across-the-board tax or budget limitations. If the states are going to meet their long-term infrastructure needs, they are going to have to develop appropriate long-term financing strategies, and not expect to solve infrastructure problems with year-by-year, "quick fix" remedies.

Similarly, if the states are going to fulfill their side of the federal-state partnership, they are going to have to augment their capacity to inventory and analyze their own infrastructure needs, and to define and carry out coordinated and innovative capital investment and maintenance programs.

The bottom line is that the infrastructure needs of the nation through the year 2000 are enormous. Local, state and federal governments owe it to the public to address the problem as realistically and efficiently as possible. The stakes are too high to allow any less.

Those living downstream from aging dams face potential disaster

Local, state and federal governments owe it to the public to address the problems as realistically and efficiently as possible. The stakes are too high to allow any less.

ACKNOWLEDGMENTS

Financial support for the study was secured from many sources. Generally, each participating state provided assistance to complete its own study. Other funds came from: the Ford Foundation, Rockefeller Brothers Fund, Piton Foundation (Colorado), Gates Foundation (Colorado), the University of Missouri at Kansas City, the Coalition of Northeastern Governors, the Northeast-Midwest Institute, the Port Authority of New York and New Jersey, Cummins Engine Company, R.J. Reynolds Tobacco Company, Lehman Brothers Kuhn Loeb, Cleveland Foundation, Tennessee Valley Authority and the Joint Economic Committee of Congress.

All of the participating states provided outstanding staff support. Particular thanks, however, is due Ms. Nancy Rutledge of Washington State, and Melinda Luedtke of California, for their sustained involvement in the preparation of their states' case studies. Additionally, while the findings and conclusions of the report to the JEC are those of the University of Colorado's core staff and the National Infrastructure Advisory Committee, appreciation is due Jesse White, Southern Growth Policy Board; David Arnold, Coalition of Northeastern Governors; David Harrison, Northeast-Midwest Institute; and Jim Maddy, Western Governors Policy Office. Their counsel, at various times during this study, helped sharpen staff analyses. Special acknowledgment is also due Mr. Stephen Carlson of the Port Authority of New York and New Jersey for his sustained encouragement and numerous insights during the course of the Advisory Committee and staff deliberations and to Ms. Deborah Matz, project director of JEC, for her invaluable assistance in defining Congressional concerns and for her help in maintaining crucial liaison with Congress and participating states. Finally, a special thanks is due Mr. David Greenberg for his editorial help in converting a lengthy and complex analysis prepared for the JEC into a brief report to the American public.

Executive Summary

The Infrastructure Crisis: An AGC Update

Since 1965, the percentage of the Gross National Product (GNP) devoted to spending by all levels of government on public works has dropped from 4.1 percent to 2.3 percent—a 44 percent decline. Despite the growth in total government expenditures, spending on public construction has failed to keep pace with inflation in almost every year since 1968. The chief cause of this decline is deferred replacement of aging structures, which is resulting in substantial deterioration of this nation's infrastructure. Some of the symptoms are poorly maintained roads, closed bridges, polluted waterways, leaking water supply lines, unsafe dams, and obsolete and energy-wasting buildings.

For the last 20 years or so, capital spending on public works—at all levels of government—has been competing with social service spending—and losing. Our nation can no longer afford to lose.

The problem has become a crisis because economic renewal depends on an adequate infrastructure. When a community wastewater treatment system is operating at 80 percent of capacity, for example, it cannot add industrial load. A Department of Commerce survey reports that 50 percent of these systems nationwide are operating at 80 percent of capacity or higher. This means 50 percent of the nation's communities are in a no-growth status.

No inventory exists of public works in the United States, which prevents a firm assessment of the extent of infrastructure deterioration and a firm assessment of needed investment to meet infrastructure needs.

AGC, however, has surveyed existing literature and studies on infrastructure needs and contacted over 100 organizations, states and cities in an effort to develop a documented estimate of necessary investment to meet *presently identified* infrastructure needs. The AGC research reveals a *minimum* necessary capital investment of approximately $3.03 trillion. While the time frame for addressing such needs varies in the individual infrastructure categories, a weighted average indicates that most investment is projected to be necessary within the next 19 years.

The $3.03 trillion must be viewed as a minimum figure. There are a number of significant infrastructure categories for which no needs information exists, and can't be included in the $3.03 trillion estimate. Such omissions include: rural potable water needs; parks; certain health care facilities; levees, dikes and revetments; libraries; firehouses; federal, state and local office buildings; among many others. Complete information on all such infrastructure needs would significantly increase the presently identified $3.03 trillion estimate.

Public works investments at all levels of government generally account for approximately 24 percent of all new construction put in place, or approximately $56 billion based on the 1982 value of construction put in place. Continuation of such public works investment levels would produce, over the next 19 years (in 1982 dollars), a total investment of $1.06 trillion compared to the minimum necessary investment level of $3.03 trillion—a total shortfall of approximately $1.97 trillion and an annual shortfall of $104 billion in 1982 dollars.

These necessary investment figures compare favorably to GNP allocations of other countries. An annual public works investment of $160 billion when added to existing annual private construction investment of approximately $179 billion would produce a total annual construction investment of $339 billion, raising construction investment as a percent of GNP from its current 7 percent level to approximately 10 percent. In Canada, construction investment as a percent of GNP is 16 percent, in Sweden its 16 percent, and in Japan, 20 percent.

While construction creates buildings, roads, dams, sewer lines and all that goes with them, it also creates jobs, material purchases, salaries, tax revenue and more. Based upon data generated by the Department of Commerce's Bureau of Labor Statistics (BLS), the Department of Transportation and the Council of State Planning Agencies, each "on-site" construction job generates an equal number of "off-site" jobs and induces nearly three times that number by corporate expenditures and the spending and respending of wages. For example, $1 billion spent on Federal-aid highway construction produces 13,000 on-site jobs, 13,200 off-site jobs and 36,700 induced jobs for a total of 63,000 jobs. Infrastructure investments will not only reduce unemployment, but subsequently reduce unemployment benefits, increase payments into the Social Security funds, and increase federal income tax collections thus reducing the net cost of the investments.

A review of the attached study reveals the diversity and complexity of funding needs. It also reveals that no single answer, no single investment strategy, no single funding mechanism will suffice. Each level of funding authority and responsibility has a role to play in devising a program to increase public capital investment.

Currently popular proposals for addressing the infrastructure crisis include: capital budgeting, state infrastructure banks, public works inventories, National infrastructure commissions, accelerated construction programs, National Public Works Banks for self-financing public facilities, and proposals for giving state and local governments the option of issuing taxable bonds. These proposals should not be competing on the basis of which provides the best overall solution. *Any and all cost effective proposals which can guarantee a net increase in public works investments should be implemented.* Only through a *variety* of mechanisms, at all levels of government, can progress be made. *The unalterable fact is that public works investments must be dramatically increased at all levels of government.*

AGC makes the following general recommendations regarding infrastructure funding:

1. Where a federal presence in infrastructure funding (both direct and federally-assisted) is justified, such federal funding must be adequate.

2. All levels of government must realign funding priorities. The infrastructure crisis is of such magnitude and so integral to economic revival, growth, and employment that it must take precedence over social spending.

3. The key element in infrastructure funding must be dedicated, long-term funding mechanisms for all infrastructure categories. The funding must be dedicated to avoid shifting capital investment spending, as occurred during the past 20 years. The funding must be long-term to provide stability in the infrastructure effort.

4. To maximize efficiency and economy in the expenditure of infrastructure funding and to provide productive private sector employment, infrastructure construction must be accomplished by the private sector through the single contract method and open competitive bidding.

5. User fee funding mechanisms and enterprise authorities should be used to the maximum extent.*

6. Capital budgeting should be implemented by all levels of government to assure increased infrastructure investment.

7. State Infrastructure Banks should be established with initial capitalization from both the federal government and the states, *provided* the creation of the banks will result in a net increase in infrastructure investment.

Summary of Total Identified Needs

Presently Identified Need	Cost (current dollars)
Potable Water (Urban)	138.6 billion
Wastewater Treatment	507.8
Drainage. Minor Flood Control	169.4
Housing (multi-family and low-income)	112.0
Hospitals	130.0
Educational Facilities	49.0
Prisons	7.0
Post Offices	3.0
Locks	15.0
Ports	3.7
Waterways	32.5
Dams Reservoirs	83.5
Railroads	60.1
Mass Transit	37.2
Highways	1570.3
Airports	60.3
Bridges	51.7
	$ 3.03 trillion

• An authority may be created to issue its own bonds, build projects and lease them to municipalities: make loans and grants to municipalities: and buy municipal bonds. A state legislature may also empower a number of local governments to band together into a quasi-governmental authority empowered to issue its own debt instruments. Such authorities generally license the authority to finance and construct a facility and operate it with user charges as a self-financing business.

CHAPTER I. CONSIDERING PUBLIC WORKS INVESTMENT --FRAMEWORK AND OVERVIEW

The nation's public works infrastructure--defined here as including highways, public transit systems, wastewater treatment works, water resources, air traffic control, airports, and municipal water supply--is suffering from growing problems of deterioration, technological obsolescence, and insufficient capacity to serve future growth.[1] The nature, extent, and severity of these problems vary widely among the systems considered. But attention on them has converged at a time when tight budgetary constraints are forcing the federal government, the states, and the localities to review spending priorities and to make difficult decisions about what they can and cannot undertake.

At the federal level, capital spending for public works is projected to average more than $24 billion a year between 1983 and 1990 (see Table I-1).[2] If current programs are maintained without change, these outlays would fall somewhat short of meeting needs as they are defined by the agencies with a role in providing these services.[3] Meeting needs under federal programs as they are now structured would raise annual federal spending to about $28 billion--or more, if needs are interpreted as reflecting a broader federal responsibility. At the same time, however, federal policies could be altered in a way that could bring the total federal costs to a lower level than under current programs--albeit with important

---

[1] The concept of infrastructure can be applied broadly to include such social facilities as schools, hospitals, and prisons, and it often includes industrial capacity as well. The seven systems considered in this study share the common characteristics of capital intensiveness and high public investment at all levels of government. They are, moreover, directly critical to activity in the nation's economy.

[2] Unless otherwise noted, all dollar figures cited in this study are expressed in 1982 dollars.

[3] Needs are inherently difficult to quantify. They can depend on levels and quality of services, valuations of time, health, and safety, and other concerns. The composition of needs estimates is described in each chapter.

L

TABLE I-1. FEDERAL SHARE OF ANNUAL CAPITAL INFRASTRUCTURE COSTS UNDER CURRENT AND REVISED POLICIES, 1983-1990 (In billions of dollars)

		Annual Spending to Meet Alternative Measures of Need	
Infrastructure System	Current Spending Level	Under Current Program Structure	Under Revised Programs
Highways	12.7	13.1	9.3
Public Transit	3.7	4.1	2.2

implications for the states and localities that participate in providing public works and for the private-sector beneficiaries of infrastructure services.

The structure of many current federal programs tends not to encourage selection of the most efficient projects. Many also channel federal money toward projects that are of greater local interest than of overall nationwide benefit. Further, many federal programs were designed for important goals that have now been met--building a national network of highways, for example, or fostering regional development of agriculture, or constructing a system of locks and dams. Today, however, the more pressing needs are maintenance and repair.

Revised programs that emphasized investments with clear national significance and that reduced the current bias toward capital-intensive undertakings could improve the cost effectiveness of federal spending. One mechanism to help guide cost-effective investment is increased use of user fees, which can either raise money for needed projects or dampen demand, in turn diminishing needs. Under policies redesigned to reflect these considerations, federal costs to meet the nation's infrastructure needs could in fact be reduced to about $20 billion a year--$4 billion less than current spending.

Though such changes could bring about more cost-effective investments and with them, reduced federal spending, they might have to be coupled with other major nonfederal changes. State and local commitments to public works spending might have to rise. Users of services might have to pay more than they do now. And the levels of service now available might have to be diminished.

THE DIVERGENCE OF NEEDS AND POLICIES

Policies of planned governmental subsidization evolved out of concerns for regional development and fairness dating back to the early days of the nation's expansion and settlement. The aim of accelerated development of the West at the turn of the century, for example, prompted the federal government to foster western agriculture by subsidizing irrigation systems. Assistance to needy regions and groups of people has been another motive underlying federal subsidies to infrastructure services. Examples include the Appalachian highway program and much of federal aid to urban mass transit systems. Most federal infrastructure programs, having evolved without a single direction and having been shaped over time by the need to establish an infrastructure foundation, fail to recognize today's highest priorities--repair, rehabilitation, and replacement. Thus, the orientation of current federal infrastructure policies can promote inefficient spending.

Many of the concerns that once motivated subsidies for infrastructure facilities may now no longer apply. And in some instances, continuation of these policies can distort economic choices. Freight shipping on inland waterways, for example, has become a mature business, suggesting that the need for nurturing, in the form of federal subsidies, may long since have been met. In fact, these subsidies now cover more than one-fourth of the costs of the barge industry, many times the share of federal subsidies for other modes of transport. As an example of economic distortion, federally subsidized water transport encourages the use of barges rather than railroads, and this in turn stimulates demand to build more locks and dams with federal dollars.

CHAPTER II. HIGHWAYS

From a federal perspective, the area of most pressing need is the heavily traveled Interstate System, which, though not yet complete, suffers from accelerating deterioration. Though lesser roads also show signs of neglect, the Interstate System confers the clearest economic benefit to the nation as a whole. The federal cost of meeting major highway needs (including bridge work) is roughly $13.1 billion a year through 1990, of which the Interstate share would be some $7.5 billion. In size, the current federal commitment of $12.7 billion a year to highways seems reasonably matched to needs, and collections from user charges, substantially increased by 1982 legislation, cover federal costs adequately. But the structure of current policies does not always foster effective investment. Favoring new construction, current policies do not do enough to meet mounting needs for repair, resurfacing, and rehabilitation; by offering high federal matches to states and localities for construction investment, current policies promote states and localities to neglect repair. A redirection of policies to increase federal funding for nonconstruction purposes and/or to limit the federal role to those areas of clearest national importance would permit a reduction in federal highway taxes.

CHAPTER III. PUBLIC TRANSIT

While local fiscal constraints have forced many transit authorities to neglect the worsening physical conditions of older-generation rail systems, high federal capital grants (80 percent of investment costs through 1982, now 75 percent) have induced some cities to start new capital-intensive systems, particularly rail. (By and large, the transit bus fleets are in adequate condition.) The allocation of federal grants appears to favor urban areas with less pressing needs rather than the most transit-dependent cities. Not enough of the $3.7 billion available for distribution as federal capital grants goes toward mounting repair and rehabilitation needs, although the overall sum appears ample to meet transit needs as estimated by CBO at $3.6 billion a year through 1990. Adjustment in federal policies to improve the cost effectiveness and targeting of spending could permit transit needs to be met within current federal spending, and might even allow a reduction in the penny of the new tax on motor fuel that goes to transit. Such changes could include lowering the federal matching ratio, revising the distribution formula to favor cities that rely most heavily on transit, disbursing federal monies in transit block grants with few federal stipulations as to their use, and permitting experimentation with nontraditional modes.

CHAPTER IV. WASTEWATER TREATMENT

Inadequate sewer pipes and sewage treatment as well as insufficient system capacity to handle storm runoff characterize many of the nation's 15,000 wastewater treatment systems. If uncorrected, these problems could compromise federally mandated ambient water quality standards. Costs to meet wastewater treatment needs are estimated by the Environmental Protection Agency to total $118 billion by the year 2000, but projected federal and nonfederal outlays combined fall short of that goal by about 24 percent. The federal role in financing a major share of wastewater treatment has already begun to decline under recent legislation from 75 percent of capital costs since 1972 to 55 percent in 1985. To compensate for near-term losses and longer-term reduction of federal support prompted by budgetary strictures, local wastewater authorities, assisted by states, could step up efforts already under way to explore other public and/or private financing sources. Further, federal regulatory measures governing wastewater treatment might in certain instances be waived at no risk to natural water quality.

CHAPTER V. WATER RESOURCES--MULTIPURPOSE DAMS AND NAVIGATION WORKS

Needs for investment in water resources are divided roughly evenly between efforts that would prolong the useful lives of numerous dams and navigation works and those that would provide new or replaced capacity. On the basis of estimates by the U.S. Army Corps of Engineers, which builds and maintains multipurpose dams and a large share of all navigation works, the CBO estimates annual federal costs to meet water resources needs to be about 60 percent higher than current spending, going from $2.3 billion to $3.7 billion each year between 1982 and 1990. To meet total needs--about $4.1 billion a year--states and local governments would have to spend an additional $400 million a year. Backlogs of projects that have been approved but not begun have compounded these needs. CBO analysis concludes that needs estimates may be exaggerated, finding the federal role in financing (nearly 100 percent) and paying (roughly 70 percent) for these services one likely cause of overstatement, along with nonfederal financing shares that may be too small, and undercharges to users. Adjustments in the current allocation of costs, entailing realignment of responsibilities among levels of government, intergovernmental grants or loans, and major increases in user fees, could help contain increases in federal costs, holding them perhaps at $3.1 billion a year, or about 35 percent above current federal spending.

CHAPTER VI. AIR TRAFFIC CONTROL

Though still adequate to assure safety, the air traffic control system, run by the Federal Aviation Administration, is in need of modernization. The Congress has approved the FAA's National Airspace System Plan, which according to the FAA could cost an estimated $10.7 billion to implement but could save $25 billion by the year 2000 by replacing antiquated equipment with modern microchip technology. CBO analysis points to a conclusion that investment in this plan would prove sound no matter what course growth in aviation takes in coming years. Implementation of the plan, however, would depend critically on consolidation and closure of many facilities, which would entail major personnel reductions and would likely encounter strong opposition. The pace of modernization could be altered to allow gradual and more cost-effective phase-in of new technologies. A slowing of the growth in air traffic, which could result from withdrawing subsidies and raising user fees on general aviation (small aircraft used for corporate business and recreation) to levels that recovered the full federal costs of services to that class of users, could buy time to allow the FAA plan to be implemented in stages that would institute new equipment as it develops.

CHAPTER VII. AIRPORTS

The dominant problem of U. S. airports is congestion: 90 percent of all air passenger volume funnels through just 2 percent (66) of the nation's 3,159 public facilities. Over the 1970-1980 period, the federal share of airport capital costs was 38 percent, or $15.3 billion. To meet expansion needs as estimated under current policy, federal outlays would have to increase nearly twofold. CBO's analysis concludes that these projected needs may be exaggerated for two reasons. First, the strong financial position of major airports and their relatively easy access to nonfederal capital, reinforced by high bond ratings, suggest that the current rather small federal role could be diminished still further. Second, general aviation, especially small aircraft used for business, is heavily subsidized in the use of airports and accounts for a major share of the traffic clogging those facilities. Federal airport expenditures are now fully recovered by charges to users of commercial airlines (as ticket taxes), while general aviation users pay very little. Thus, general aviation is encouraged to use major airports instead of the numerous satellite ("reliever") airports that could accommodate them. Several measures could help redistribute this traffic among existing facilities and/or raise funds to pay for expansion. Passenger fees for terminal use--now prohibited by federal law--and surcharges for peak-hour landings at large airports might somewhat reduce overall general aviation traffic and/or divert it to reliever airports and to off-peak hours of travel.

CHAPTER VIII. MUNICIPAL WATER SUPPLY

Despite clear indications of physical and financial problems in the nation's municipal water supply systems, the CBO analysis points to no need for any appreciable expansion of the now small federal role. Federal outlays for municipal water systems totalled about $900 million in 1982. Physical problems are characterized as deterioration of existing distribution facilities, inadequate treatment facilities, and insufficient capacity to meet projected population growth. Overall funding to remedy these problems in the 756 urban systems that serve the most densely populated areas would total $6 billion to $9 billion a year by 1990. Up to 95 percent of these needs could be met with increased consumers' rates, many of which are now held at very low levels, and with a variety of state and local financing sources to which many water authorities might have access if certain barriers were overcome. The emphasis of such federal aid as is now provided seems properly targeted toward federal concerns--toward urban areas in fiscal distress and impoverished or thinly populated rural areas.

Fragile Foundations:
A Report on America's Public Works

Final Report to
the President and the Congress

National Council on Public Works Improvement

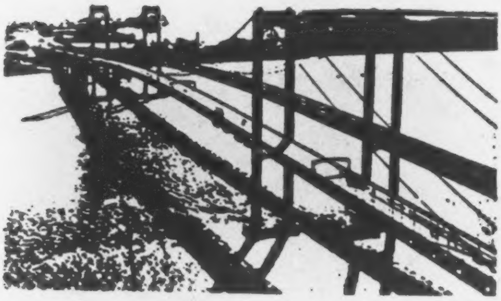
February 1988

Summary of Findings

The quality of a nation's infrastructure is a critical index of its economic vitality. Reliable transportation, clean water, and safe disposal of wastes are basic elements of civilized society and a productive economy. Their absence or failure introduces an intolerable dimension of risk and hardship to everyday life, and a major obstacle to growth and competitiveness.

The Erie Canal; the transcontinental railroads; the great dams and water systems of the west; the airports, seaports, and transit systems that serve our cities; our network of modern highways and soaring bridges—all these are part of this country's great public works inheritance from the generations of Americans who built before us. These massive and sometimes daring achievements supported the growth of the greatest economic power the world has ever known. They have been the envy of other countries and the model for our competitors.

Now that inheritance is in danger.



After two years of study, the National Council on Public Works Improvement (the "Council") has found convincing evidence that the quality of America's infrastructure is barely adequate to fulfill current requirements, and insufficient to meet the demands of future economic growth and development.

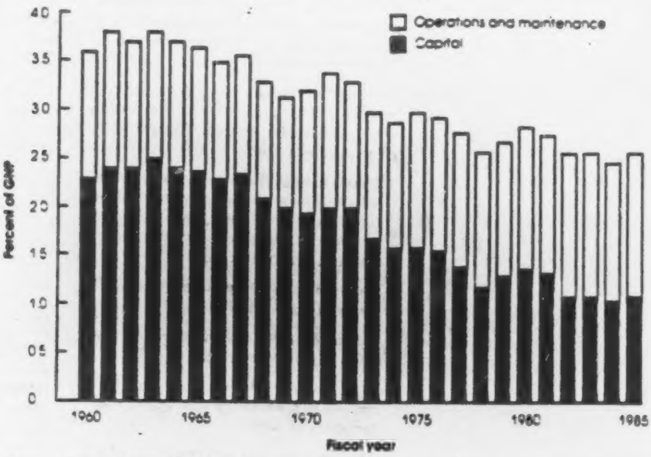
And unless we dramatically enhance the capacity and performance of the nation's public works, our own generation will forfeit its place in the American tradition of commitment to the future. Without such an effort, our legacy will be modest at best. At worst, we will default on our obligation to the future, and succeeding generations will have to compensate for our failures.

> *"We're spending our inheritance. You know, we built this freeway system . . . in the '50's and '60's, and we are still trying to make that do for today's needs."*
>
> Secretary Dewey Lonsberry,
> New Mexico Dept. of Highways
> and Transportation
> Council Hearing,
> Los Angeles, July 29, 1987

At present, most major categories of public works in the United States are performing at only passable levels. A few, such as water supply and water resources, remain in reasonably good shape. But others, such as solid waste and hazardous waste disposal, have serious and growing problems. In addition, smaller systems—in all categories and in nearly all regions of the country—face especially acute difficulties.

Part of the problem is financial. Overall investment in public works has slowed in the last two decades in relation to the demands of growth and environmental concerns. We have worn through the cushion of excess capacity built into earlier investments. In effect, we now are drawing down past investments without making commensurate investments of our own. Fig-

Figure 1—Public works outlays as a percent of GNP



Sources: U.S. Office of Management and Budget, Budget Appendices of the United States; U.S. Department of Commerce, Bureau of the Census, Government Expenditure Series; and The Economic Report of the President for various years.

ure 1 illustrates this pattern of decline in public works spending as a percent of GNP.

With nearly one trillion dollars of public works assets[1] in the United States, reduced spending over the short term does not mean that individual facilities are in imminent danger of collapse, or that particular regions are in immediate peril. However, a declining infrastructure inevitably will jeopardize the productivity of our economy and our quality of life. Failure to reverse this decline will exact a high price for the nation in the future, both in the cost of deferred investment and in reduced economic competitiveness.

Therefore, the Council recommends a national commitment, shared by all levels of government, the private sector, and the public, to vastly improve America's infrastructure. Such a commitment could require an increase of up to 100 percent in the amount of capital the nation invests each year in new and existing public works. In 1985, this amount was approximately $45 billion.

Dramatically expanding current capacity or doubling the rate of capital spending is not an absolute requirement in all infrastructure categories, at all levels of government, or in all regions of the country. However, an increase in capital spending of this magnitude is an important and achievable goal for the nation as a whole by the end of this century. For some categories, such as hazardous waste disposal, an even greater effort may be warranted.

---

[1] This represents the approximate cumulative depreciated value of the public works facilities in the Council's purview. These include: highways, mass transit, aviation, water resources, water supply, and wastewater, solid waste and hazardous waste disposal. Public works can be interpreted more broadly to include communications, energy facilities, schools, hospitals, prisons, and parks. In an effort to target its resources, the Council has limited its primary focus to transportation, water, and waste disposal issues. Nevertheless, a considerable portion of its research findings and policy conclusions may apply to other areas.

A strategy to upgrade America's infrastructure must incorporate other tactics in addition to increased investment. **Thus the Council also recommends:**

- **Clarification of the respective roles of the federal, state and local governments in the construction and management of infrastructure to focus responsibility and increase accountability;**
- **Steps to improve the performance and efficiency of existing facilities;**
- **A rational capital budgeting process at all levels of government;**
- **Strong incentives to ensure adequate maintenance and, where appropriate, adopt new technologies; and**
- **More rigorous and widespread use of low capital techniques for delivering services and meeting service needs, such as demand management, coordinated land-use planning, and waste reduction and recycling.**

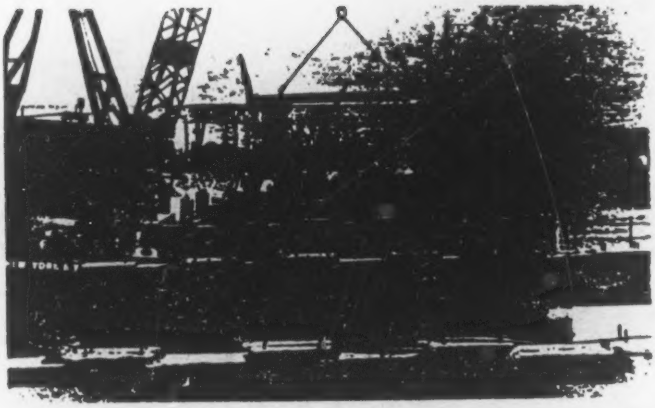
Through these measures the nation can make the best use of existing assets. This approach also may help to defer or avoid a significant portion of capital needs and costs that otherwise would be required in the future.

> *"Where in this myriad of problems is the good news? I would suggest that it lies in the opportunity to get government moving before an infrastructure crisis is upon us."*
>
> Michael Deland,
> Regional Administrator, EPA,
> Boston, Massachusetts
> Council Hearing
> Boston, Aug 3, 1987

The Council recommends that state and local governments continue to play their traditional leadership roles in the construction and management of the nation's infrastructure. But the Council also believes that the federal government must act as a full and responsible partner on a long-term basis in the national effort to increase and sustain public capital investment.

There is much to set right in America's house. The Council recognizes that an increased investment in infrastructure is just one among many critical claims on the nation's resources. To address this claim and others requires that we reckon first with the growing imbalance between consumption on the one hand and investment and savings on the other. This imbalance, reflected in the federal budget deficit and in other forms of borrowing against the future, affects all federal spending decisions. **The Council supports appropriate actions to redress the imbalance between consumption and savings so that future infrastructure commitments will not be shortchanged.**

The Council believes that infrastructure must rank high among our priorities. We must ensure that our highways and subways can move us swiftly and safely; that our homes, farms, and industries are supplied with ample clean water; that we re-



duce and safely dispose of the increasing volume of poisonous wastes our society generates, and that we provide the structural underpinning for a robust and competitive economy.

To reach this goal by the turn of the century, we must start now to rebuild what we have neglected, to repay where we have borrowed, and to invest again in our future and our children's future.

TO EXAMINE THE FUTURE OF OUR NATION'S INFRASTRUCTURE NEEDS

THURSDAY, MARCH 29, 1990

House of Representatives,
Committee on Public Works and Transportation,
Washington, DC.

The committee met, pursuant to notice, at 10:16 a.m., in room 2167, Rayburn Office Building, Hon. Glenn M. Anderson [chairman of the committee] presiding.

The Chairman. The committee will come to order. Good morning to all of you.

Before we begin today's hearing, I would like to introduce the newest members of the committee, the Hon. Gary Ackerman of New York, the Hon. Chris Perkins of Kentucky, and the Hon. Susan Molinari of New York.

Gary Ackerman is a native New Yorker, born in Brooklyn. He attended New York City public schools and is a graduate of Queens College. He is a former public school teacher, newspaper editor, and businessman.

Gary served in the New York State Senate from 1979 until his election to Congress in 1983. He and his wife Rita have three children. Please join me in welcoming Congressman Ackerman.

[Applause.]

Chris Perkins is no stranger to the committee, having served previously on other assignments. He is an attorney by education and a former Member of the Kentucky House of Representatives until his election to the 98th Congress.

Chris and his wife Janet have two children. Please join me in welcoming Congressman Perkins.

[Applause.]

The Chair now recognizes the distinguished gentleman from Arkansas, Mr. Hammerschmidt, to introduce the third one.

Mr. Hammerschmidt. Thank you very much, Mr. Chairman. I want to join you in a warm welcome to Gary Ackerman and to Chris Perkins. Chris is certainly no stranger to this committee; he served on it previously.

Now, I am extremely pleased to welcome our new colleague from Staten Island, Congresswoman Susan Molinari.

[Applause.]

We are fortunate that in this case, service in the Congress and on our committee seems to be a family tradition. Susan's father, Congressman Guy Molinari, was one of our most outstanding and dedicated members. Before his election to Congress, Guy had served in the New York Assembly just as his father, Robert Molinari, had in the 1940s.

While we hated to see Guy Molinari leave to make his successful race for the Staten Island Borough Presidency, we are delighted to have Susan take his seat in the House and on this committee. She has certainly accomplished a great deal in a short period of time, and I am confident that she has a bright future in this body.

Before joining the 101st Congress, Susan Molinari served as Minority Leader of the New York City Council from 1985 until 1990. She was the youngest person ever elected to the council, and while there, she served as an ex officio member of all committees including environmental protection, which is one of her special concerns.

On this committee, Mr. Chairman, Susan will serve as a member of our Aviation and Water Resources Subcommittees. On behalf of the minority membership of our committee, I am proud to welcome Susan Molinari to our ranks. I look forward to working with her in the months and years ahead.

[Applause.]

The CHAIRMAN. Thank you, John Paul. I want to let you know that I welcomed Susan the other day when we swore her in, and I told her that she is going to make the New York delegation look a heck of a lot better. [Laughter.]

Susan, you are very young, but a hundred years ago almost, I was the youngest mayor in the United States at one time. We are kind of together on that.

Mr. HAMMERSCHMIDT. That was in Hawthorne, California, Susan.

The CHAIRMAN. It was also 1940, before she was born.

Mr. HAMMERSCHMIDT. During the Civil War. [Laughter.]

The CHAIRMAN. Today's hearing is on the future of our Nation's infrastructure needs. With this hearing, we begin the first in a series of events organized to provide informational tools that we will need to address this issue, to raise public awareness, and to get all of us involved in solving the problem of this Nation's infrastructure crisis.

Next in the series, which is tomorrow, is an informal roundtable discussion on infrastructure, productivity, growth, and competitiveness. We have assembled a panel of distinguished economists who will share their thoughts and expertise. John Paul and I believe this will be a most informative event, and I would encourage each of you to attend.

Continuing the series through the remainder of this year, the committee will review local and State programs that have been successful, look at financing options and explore new technologies, and we will also hold meeting at sites around the country to hear a broad range of ideas.

To solve the problems of infrastructure will not only require billions of dollars, a combination of Federal user fees and State and local revenues, but also massive amounts of cooperation, commitment, and hard work on everyone's part. We need to find a way to drive home to the American public the fact that the very quality of our lives depends upon the quality of our infrastructure, even upon something as basic as our water supply.

When we turn on the tap, we can expect clean water to flow into our glass. At the present rate of investment in our infrastructure, this convenience could become a luxury.

Infrastructure is not an exciting subject by any stretch of the imagination, but it is a terribly important and imperative one. It is at the very core of our quality of life. It is the cornerstone of our cities and rural communities. I think that we will find that it is entwined in a fragile balance with our economy. A sound economy must be based on a solid infrastructure.

For the past 20 years, with the demands of a tight budget and inflation, the maintenance of public facilities, essential as they may be to the economy, were continuously postponed until tomorrow. Well, tomorrow is here. Now we have to decide what we intend to do about it.

We need to answer some key questions. First, what measures do we take to avoid traffic congestion tripling by the year 2005? In any given day, there is a 45 percent chance that each of us will cross a bridge that is either structurally deficient or functionally obsolete. Do we finance improvements to those odds?

How do we meet the needs of expanding airline traffic when we have not built a new airport in this country since 1974? How do we maintain a functioning water system when some of our urban water lines are over 100 years old, losing as much water as they move? What do we do with the trash that piles up or floats around on a barge for over a year for lack of disposal facilities?

Today we have an impressive agenda of prestigious witnesses before us who can speak with some authority to these issues and many others. They are the Hon. Richard Gephardt, Majority Leader of the House of Representatives, the Hon. Newt Gingrich, the Minority Whip, Major General Patrick Kelly, the Director of Civil Works for the United States Army Corps of Engineers, and Mr. John Horsley, the founder of the Rebuild America Coalition. This is indeed an impressive roster that we have today to kick off a vital series of committee events.

Let me now introduce one of the best members of our committee. I sometimes say that he is so great that it makes him sound better than I, which is difficult. He is one of the greatest guys in the Congress, John Paul Hammerschmidt.

Mr. HAMMERSCHMIDT. Thank you very much, Mr. Chairman. You are too kind.

As you suggested in your opening statement, our Nation's infrastructure has an image problem. It does not compete as well as it should with more high profile issues and programs, probably because there is nothing especially sexy or exciting about roads, bridges, airports, public transit systems, waterways, and sewage treatment plants. They do not instantly capture the imagination and attention of the public, unless there is a catastrophic bridge collapse, a dam break, an earthquake, or the like.

It is sad but true that we take our infrastructure for granted. That is a serious mistake because it is so basic to our economy and to our daily lives. As a witness observed at one of our needs hearings several years ago, if you live in one of our larger cities, you probably start your day with a shower using the city water and sewage system. You brew your morning coffee with electricity generated by the local power company.

When you head off to work, you travel over roads built with local, State, and Federal monies. You might be taking public transit for all or part of your trip. When you get to your office, you will no doubt use your telephone extensively.

One phone call might be to arrange a business trip. When you make that trip, you fly out of the local airport and when you reach your destination, you might as well take a commuter train into town. If it is raining, you can put your mind at ease while a municipal storm sewer system protects the street from flooding.

All of these components of public infrastructure make our day run smoothly, so smoothly that we hardly even notice—apparently so much so that we think it will last forever. But it will not last forever. If you have any doubts, stay tuned to the spokesmen from the Rebuild America Coalition and the Corps of Engineers and join us for the other hearings that we will be having over the coming months.

As good as our system is, we can not afford to sit on our hands. The opening of the Western European markets and the economic revival of Eastern Europe are clear warnings to us that we had better be an economic competitor or we will slide into second rate status.

Our infrastructure drives economic growth and productivity. If we neglect it, we will lose our competitive edge and be saddled with an unmanageable trade deficit. Both Japan and Germany have five year plans to ensure continuous infrastructure funding. Either we continue to control our own destiny, or someone else will.

Japan already has a productivity growth rate that is more than four times that of the United States. Our children and grandchildren will hold us accountable for what we do. If they are stuck with the bills for our short-sightedness, they will ask what we were doing when we had the watch over the Nation's public works and transportation system.

Mr. Chairman, I want to commend you for scheduling this very important hearing. This is a bipartisan issue, and the fact that our distinguished House Majority Leader and Minority Whip are here further emphasizes that fact.

I want to welcome Congressman Gephardt and Congressman Gingrich, who is a former member of our committee and who will be here later. I also want to welcome the other witnesses who are going to testify.

The **Chairman**. Thank you very much, John Paul.

I am going to ask if there are any other opening statements? To accommodate the schedules of our Majority Leader and Minority Whip, I ask that any other opening statements be very brief.

Mr. Mineta?

Mr. **Mineta**. Mr. Chairman, I will just submit my statement for the record. Thank you for your leadership and that of Congressman Hammerschmidt on scheduling these hearings to focus on the rebuilding of our Nation's infrastructure.

The people who are on the agenda are knowledgeable and have been on the cutting edge as it relates to this whole issue of our infrastructure needs. Those needs are great and must be addressed if we are to be productive as a country and competitive in an international, global market place.

We saw our net public investment by Federal, state, and local governments that averaged some 2.3 percent of GNP in the sixties and seventies drop to .4 percent in 1984. We know what the result of that has been.

Our bridges are crumbling. In the next 10 years, over a million miles of our highways are going to have to be repaved. Those facts and figures are available to all of you. You know what they are, so it really is imperative that we invest in the future if we hope to compete in that world market place.

Again, Mr. Chairman, thank you and Mr. Hammerschmidt for leading the way.

[The prepared statement of Mr. Mineta follows:]

REMARKS BY

NORMAN Y. MINETA, M.C.

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

HEARING ON

INFRASTRUCTURE NEEDS

MARCH 29, 1990

Mr. Chairman, I applaud your leadership for scheduling hearings to focus on rebuilding of the Nation's infrastructure. Our Nation's infrastructure must be prevented from crumbling into ruins.

As the Committee deliberates the status of America's infrastructure, we will be focusing on how to preserve our nation's competitiveness and our citizens' quality of life into the 21st Century.

The key question that must be answered is "What must the Congress do to rebuild America?". Today, we take the first step toward finding a solution.

A sound American infrastructure is absolutely essential if the United States is to flourish in the 1990's and enter the 21st Century as a world leader.

A sound American infrastructure will bolster our international competitiveness, foster domestic economic development, improve public safety and enhance our overall quality of life.

When we mention "infrastructure", the tendency is to think roads, bridges, mass transportation, airports, waterways, water supply, wastewater treatment, and solid waste disposal systems. However, make no mistake, an essential element of the nation's infrastructure will focus on a sound network of transportation systems.

Meeting our transportation needs is a substantial challenge. We are not only concerned about the future, but about playing catch up on the nation's unmet needs.

Net public investment by Federal, state and local governments averaged 2.3 percent of GNP in the 1960's. It dropped to four-tenths of 1 percent during Ronald Reagan's first term in office.

Meanwhile — outside the Capital Beltway, as well as on it — urban traffic congestion increased by 50 percent since 1980. What's worse is that a recent study by the General Accounting Office predicts that delays on urban freeways will increase 436 percent by the year 2005.

Is there any wonder why?

Half our Nation's bridges are deficient or functionally obsolete.

More than a million miles of highway will need to be resurfaced in the next 10 years alone.

And all the while, Federal highway expenditures have been on the decline. And since 1981, mass transit funding has been cut in half.

Underfunding these programs in the past may have made sense to some for the sake of a short-term fiscal breather. But over the long haul, we have crippled our ability to compete by inadvertently denying America's businesses and the American people to a fully functional transportation system.

The bottom line is this: We must invest quickly and wisely in our transportation infrastructure before it is too late.

As the Subcommittee on Surface Transportation continues its efforts to develop comprehensive legislation to reauthorize the surface transportation programs for the 21st Century, our focus will be on preserving the nation's infrastructure.

The truth is this: We must invest in the future, if we hope to compete in the world marketplace.

The CHAIRMAN. Thank you, Norm.

The gentleman from Oklahoma, Mr. Inhofe?

Mr. INHOFE. Just briefly, Mr. Chairman, I also want to join those applauding you for having these hearings.

During the decades of the fifties, sixties, and seventies, it seemed like most of the infrastructure was given to the highly industrialized areas of this Nation with the idea that some of the newer areas did not have those problems. As a former three-term mayor of a major metropolitan area, Tulsa, Oklahoma, I was distressed to find at that time that our infrastructure had been neglected and that those newer parts of America are now deteriorating.

I am very thankful that we have people who are interested in Missouri, Arkansas, Oklahoma, and other areas that have long been forgotten and that they will get special attention during these hearings. Our effort is going to be toward rebuilding America, not just parts of America, but all of America. Thank you.

The CHAIRMAN. The gentleman from California, Mr. Packard.

Mr. PACKARD. Mr. Chairman, I have a very long and interesting statement. I will not give it all, but I would like to emphasize one thing.

It is politically dishonest for us to look for new ways to raise taxes, to increase user fees, to enhance revenues, when we have trust fund monies that are going unspent. My statement dwells on that to some extent along with other things, but I would like to emphasize that.

I hope that the leadership of the House and this committee will continue to pursue the use of the trust funds that have been raised for infrastructure rebuilding at the same time that we are looking for other revenue.

Thank you.

[The prepared statement of Mr. Packard follows:]

Ron Packard

STATEMENT OF THE
HONORABLE RONALD C. PACKARD
REPRESENTING THE 43RD DISTRICT OF CALIFORNIA
BEFORE THE COMMITTEE ON
PUBLIC WORKS AND TRANSPORTATION
MARCH 29, 1990

MR. CHAIRMAN. THE HEARING TODAY WILL FOCUS ON A MOST IMPORTANT NEED FACING AMERICA TODAY--OUR NATION'S INFRASTRUCTURE. AMERICA'S FOUNDATION, OUR EXISTING NATIONAL INFRASTRUCTURE IS CRUMBLING, SIMPLY FALLING APART. WHAT'S MORE, OUR CURRENT SYSTEM OF INFRASTRUCTURE; EVEN IF REPAIRED; IS INADEQUATE, AND OFTEN TIMES ANTIQUATED. OUR COMMITMENT, CONGRESS' COMMITMENT, THE ADMINISTRATION'S COMMITMENT TO BUILDING AND REBUILDING OUR INFRASTRUCTURE IS LACKING.

IT IS NOTHING LESS THAN DISHONEST TO THE

AMERICAN PUBLIC TO REQUEST AN INCREASE IN USER FEES OR A TAX INCREASE OR A REVENUE ENHANCEMENT THAT WILL BE COMMITTED TO A TRUST FUND. THE PRIMARY PURPOSE OF WHICH IS A BUDGETARY SMOKE AND MIRROR ROUTINE. THAT IS TO SAY, USING FEDERAL TAX INCREASES TO "MASK" THE FEDERAL DEFICIT. THE INFRASTRUCTURE TRUST FUNDS MUST BE TAKEN OFF-BUDGET FIRST. ONLY THEN CAN WE DISCUSS NEW TAXES TO BE SPECIFICALLY COMMITTED TO INFRASTRUCTURE. WE ON THIS COMMITTEE, IN A BIPARTISAN MANNER, HAVE PROPOSED TAKING THE TRUST FUNDS OFF-BUDGET BEFORE, ONLY TO BE DEFEATED BY THE MAJORITY LEADERSHIP ON THE HOUSE FLOOR. CONGRESS DOES NOT HAVE CLEAN HANDS ON THIS ISSUE.

NO ONE QUESTIONS THE CRITICAL NEED THAT FACES US. TO MEET THAT NEED WE MUST CHANGE OUR TRADITIONAL FOCUS ON INFRASTRUCTURE. ONLY RECENTLY HAVE WE RECOGNIZED THE IMPACT OF INFRASTRUCTURE ON OUR INTERNATIONAL

COMPETITIVENESS AND OUR DOMESTIC ECONOMIC STRENGTH. IN KEEPING WITH THAT, A GREATER EMPHASIS SHOULD BE PLACED ON COST-BENEFIT ANALYSES OF PROPOSED PROJECTS. IN A TIME OF SHRINKING BUDGETS, THIS APPROACH TO SPEND MONEY MORE WISELY DOES MAKE SENSE. INNOVATIVE FINANCING MECHANISMS CAN BE EXAMINED. USE OF NEW TECHNOLOGIES IN PLANNING AND CONSTRUCTION OF INFRASTRUCTURE PROJECTS IS NEEDED. CHANGES IN OUR FEDERAL, STATE AND LOCAL GOVERNMENT PARTNERSHIP SHOULD BE EXAMINED. MORE COOPERATION AMONG THE PARTNERS IS CERTAINLY NEEDED. IN THE CASE OF THE FEDERAL GOVERNMENT, BETTER, MORE EFFICIENT COMMUNICATION AMONG THE FEDERAL AGENCIES WOULD BE WELCOMED. GREATER PRIVATE SECTOR INVOLVEMENT SHOULD BE ENCOURAGED. THE ANSWERS DO NOT LIE SIMPLY IN RAISING FEDERAL TAXES AND SPENDING MORE FEDERAL DOLLARS. THIS IS NOT A PROBLEM THAT WE CAN THROW FEDERAL MONEY AT IN HOPES OF IT GOING

AWAY. WE NEED TO LOOK AT ALL LEVELS OF OUR INFRASTRUCTURE PROBLEM. FORGING NEW PARTNERSHIPS, USE OF PRIVATE CAPITAL, NEW FINANCING MECHANISMS, GREATER EMPHASIS ON USERS, COST-BENEFIT ANALYSES, INCREASES ON SPENDING, REVENUE INCREASES AND OTHER FACTORS ALL MUST BE CONSIDERED IN ORDER TO PRODUCE A PROPOSAL THAT WILL ULTIMATELY SOLVE OUR INFRASTRUCTURE PROBLEMS.

WE WILL HEAR MUCH TODAY ABOUT A "NEW" COMMITMENT TO INFRASTRUCTURE. WHEN OVER 40% OF OUR BRIDGES ARE IN DISREPAIR, WHEN MILLIONS OF HOURS OF PRODUCTIVITY OF OUR NATION'S WORKERS ARE LOST SITTING IN TRAFFIC OR IN AN OVER-BURDENED AIRPORT, WHEN THOUSANDS OF GALLONS OF WATER ARE LOST EACH YEAR BECAUSE OF ANTIQUATED, INEFFICIENT WATER SYSTEMS, A NEW COMMITMENT TO MEET OUR INFRASTRUCTURE NEEDS IS CERTAINLY WARRANTED.

I WHOLEHEARTEDLY SUPPORT A NEW COMMITMENT TO INFRASTRUCTURE. THIS COMMITMENT, HOWEVER, MUST TAKE INTO ACCOUNT CHANGES IN OUR ECONOMY AND CHANGES IN INTERGOVERNMENTAL RELATIONS. THIS NEW COMMITMENT MUST CREATE FLEXIBILITY FOR STATE AND LOCAL GOVERNMENTS (AS THE NATIONAL TRANSPORTATION PLAN DOES), REMOVE RESTRICTIONS PLACED ON PRIVATE CAPITAL AND YES, EVEN ENCOURAGE THE USE OF PRIVATE CAPITAL AND PRIVATE ENTERPRISE. THIS NEW COMMITMENT MUST ALSO ENDEAVOR NOT TO PENALIZE LOCAL COMMUNITIES FOR LEVYING TAXES AND BUILDING SOLID INFRASTRUCTURE PROJECTS. CURRENTLY, THE FEDERAL GOVERNMENT AND THE CONGRESS HAVE SET UP INSTITUTIONAL ROADBLOCKS TO PREVENT THIS TYPE OF LOCAL INVOLVEMENT. WHAT INCENTIVE EXISTS FOR LOCAL COMMUNITIES TO TAKE THIS ACTION, WHEN THEIR CITIZENS PAY FEDERAL TAXES AND FEES TO SUBSIDIZE OTHER AREAS OF THE COUNTRY? OR EVEN WORSE THAT SIT IN $20 BILLION

DOLLAR PLUS TRUST FUNDS? FINALLY, THE NEW COMMITMENT MUST INCLUDE THE TAKING OF INFRASTRUCTURE TRUST FUNDS OFF-BUDGET, AND COMMITTING THOSE MONIES TOWARD INFRASTRUCTURE. WITHOUT THIS STEP, WE CANNOT SOLVE THE PROBLEMS THAT FACE US.

I LOOK FORWARD TO THE TESTIMONY OF TODAY'S WITNESSES, ESPECIALLY, CONGRESSMAN GEPHARDT AND CONGRESSMAN GINGRICH, A MEMBER OF THIS COMMITTEE, WHO I AM CERTAIN HAS IMPORTANT VIEWS ON THIS SUBJECT. MAJOR GENERAL KELLY WILL TESTIFY, GIVING THE COMMITTEE THE VIEWPOINTS OF THE CORPS OF ENGINEERS, AS WILL JOHN HORSLEY REPRESENTING THE VIEWS OF REBUILD AMERICA. I WISH TO THANK THE CHAIRMAN, MY COLLEAGUE FROM CALIFORNIA, MR. ANDERSON, AND THE DISTINGUISHED RANKING MEMBER, MR. HAMMERSCHMIDT, FOR HAVING THE FORESIGHT TO CALL THIS VERY IMPORTANT HEARING. I LOOK FORWARD TO WORKING WITH MY COLLEAGUES TO

FORMULATE A PROPOSAL TO SOLVE OUR INFRASTRUCTURE PROBLEMS. THIS HEARING IS CERTAINLY AN IMPORTANT FIRST STEP.

The CHAIRMAN. Mr. Jones?

Mr. JONES. Mr. Chairman, I would like to submit my statement for the record and to echo the remarks of my colleague from California. I want to welcome the distinguished Majority Leader and our other guests here today. Thank you.

[The prepared statement of Mr. Jones follows:]

Thank you Mr. Chairman.

I commend the distinguished Majority Leader, Mr. Gephardt, and the distinguished Minority Whip, Mr. Gingrich, from the Great State of Georgia, and our other guests for appearing before us today to give their views on our nation's infrastructure needs. We look forward to your testimony.

We all agree that the condition of our infrastructure is one of the most important issues facing our nation. Our roads, bridges, mass transportation, airports and waterways, water supply and treatment are essential to our nation's economic health and continued prosperity.

Like those elsewhere in the nation, Georgia's roads, bridges, and mass transportation are in need of repair and reinvestment. To begin, we must stop the trend of declining federal investment in or infrastructure, and reverse this precipitous course.

We can start by freeing the highway and airport trust funds, and spending the money we have earmarked, by law, for investment in our infrastructure.

Over $250 million in Federal highway apportionments to Georgia are untouchable this year because we refuse to spend down the trust Fund. This is the amount committed to Georgia from the Trust Fund for building bridges and highways.

We have $1.9 billion in bridge needs in Georgia, but the state cannot even spend the $27 million pledged to us, because of the refusal to spend down the trust fund, which now has a surplus of $10.6 billion.

Many creative ideas have been proposed for the improvement of our nation's infrastructure. It badly needs improvement. But we cannot begin to make new promises until we honor those we have already made.

Thank you, Mr. Chairman.

The CHAIRMAN. Mr. Hancock.

Mr. HANCOCK. Thank you, Mr. Chairman. I would like to welcome the Majority Leader to this hearing, specifically on the fact that he is from the State of Missouri. I have read the testimony and would like to point out that even though we are concerned about the heavily populated areas of the East and West Coast, we also need to think a little about the area of the Midwest. We are still the breadbasket of the world and we are very dependent upon highway transportation.

I think that a lot of the people on the East and West Coasts appreciate the fact that most of the wheat that they put into their bread comes from the area we are from. Thank you.

Mr. LIGHTFOOT. Mr. Chairman, I have a statement for the record.

The CHAIRMAN. Hearing no objection, so ordered. We also have an opening statement from Mr. Parker which will be placed in the record at this point.

[The prepared statements of Mr. Lightfoot and Mr. Parker follow:]

STATEMENT BY CONGRESSMAN JIM LIGHTFOOT

Mr. Chairman, thank you for holding this hearing providing an overview of our nation's infrastructure needs. I think almost everyone would agree that we need to examine ways to inprove our nation's infrastructure. Although we recognize that our roads, bridges, airports, and water systems need some drastic improvements, municipal budgets do not have adequate funding to fix these problems. State and local budgets are streched beyond capacity with no relief in sight. During a period of innovative technical and industrial changes, our communities are unable to keep up with the modifications needed. Federal cutbacks have forced state and local governments to assume more of the burden of cost sharing. Compounding this problem are the regulations mandated by the Environmental Protection Agency as well as the phaseout of some of their programs designed to assist our locals. Therefore, I welcome any suggestions our distinguished guests may offer at today's hearing.

OPENING STATEMENT OF CONGRESSMAN MIKE PARKER

Thank you, Mr. Chairman. I think it is important that we are here today to address the problems of our country's infrastructure. In my opinion, they should have been addressed many years ago. The magnitude of the infrastructure problem is not reflected in any of our levels of government's priorities. The Office of Technology Assessment reported that spending for public works projects ranks fourth place or lower for all levels of government. Yet, everyone consistently agrees that the nation's infrastructure needs upgrading and that additional investment would benefit individuals and the national economy. I look foward to hearing your ideas on solutions that will not only meet our present needs, but that have the capacity to meet the needs for economic growth for many years to come. Thank you.

The CHAIRMAN. I am pleased to welcome our first witness, the distinguished Majority Leader, Hon. Richard Gephardt. We are fortunate to have the Majority Leader's strong, enthusiastic support. True to his job title, he has shown great leadership in our efforts to deal with the infrastructure challenge. As a matter of fact, he initiated a visit to New York City recently by a number of members to focus attention on some very serious infrastructure problems that they are having there.

Mr. Leader, we appreciate your commitment to infrastructure and we look forward to working with you and the entire leadership of the House in providing solutions to this vital national issue.

I give you our Majority Leader.

TESTIMONY OF HON. RICHARD A. GEPHARDT, A REPRESENTATIVE IN CONGRESS FROM MISSOURI

Mr. GEPHARDT. Thank you, Mr. Chairman, Representative Hammerschmidt, Members of the Committee. I am honored to be here today.

I want to start by saying that in my humble opinion, on the issue of our public structures, while it is not the only important challenge we face as a country, I believe that it sits right at the top with issues like education and research in what it is going to take to rebuild the economic vitality of our country.

In the last few years, I have had the opportunity to travel to other countries—both developed and undeveloped countries. In Mexico, Panama, Eastern Europe, and in China, when you talk to the leaders of those countries about how they are going to revitalize their countries, the first issue they bring up is their lack of public structures, their lack of roads to bring food to the cities, their lack of bridges, their lack of ports, their lack of public facilities.

When you go to West Germany and Japan, you see countries that are highly developed, who are truly our competitors today along with others like them. If you look at their national budgets, you clearly understand that they are spending much more than we are as a country in building and rebuilding our public structures. In fact, I am told that in West Germany and Japan today, each country is spending in dollars about as much as we are in building and rebuilding their public structures when, of course, they have populations that are much smaller than ours.

Truly, America is at a crossroads. I think there was a saying in past years about an airline—I will not name it because I do not remember which one it was—but their slogan was, "We earn our wings every day." I think that there has been a feeling in America that we have built our public structures and we do not need to worry about it anymore. It will take care of itself. That is a challenge that is behind us.

I think that more and more Americans are beginning to understand that we have to earn our public structures every generation. Right now, this generation of Americans faces perhaps the toughest challenge that we have ever faced. We can either choose the path of disinvestment in the public structures and physical structures which encompass the fiber of our economy, or we can address the problems of failing infrastructure while they are still at a manageable and somewhat affordable level.

The relationship between economic strength and level of capital investment has been understood, I think, for years. We know that severe economic consequences are directly related to traffic congestion and airport delays. It is hardly a revolutionary notion to suggest that unless the decision is made to invest in capital improvements sooner rather than later, a decline in the country's physical capacity will be coupled with a decline in economic growth and ultimately a declining standard of living for our people.

The impact is far reaching. It affects our international competitiveness. During a period when both Japan and Western European countries are expanding economically, they are increasing their share of investment in relation to overall GNP. The United States, in a period of burgeoning trade deficits, is actually reducing our share of capital investment with respect to overall GNP.

Listen to this fact: we now rank 55th in the world in capital investment in infrastructure as a share of gross national product. I think we have to ask the question: how can we expect our products to be marketed halfway around the world when we can not effectively transport our products between our towns or around towns? We can not allow this drain on economic capacity to go unchecked.

At this point, let me turn to the details of some of the specific modes of transportation to understand exactly what this Member thinks we can do better.

First, on highways. As we commemorate the centennial of the birth of President Eisenhower—a lot of us were overjoyed to be in the room and all of us, Democrats and Republicans, had "I like Ike" buttons on the other day, and I thought it was one of the greatest ceremonies in the history of the House—but as we commemorate that great man's birthday, we have to remember his role in creating the Federal Highway System.

In 1955, he proposed a visionary plan to construct a highway system covering 42,000 miles, linking every major urban center in the contiguous United States. Eisenhower had carried this notion around with him since his early days in the army during World War I. He recognized the necessity of having a system in place that was efficient for transporting and mobilizing troops. He recognized that economic security as well as military security are linked in an efficient interstate system.

When finally implemented, Eisenhower's plan set up the Federal Highway Trust Fund that was financed by a three cent per gallon tax. The Federal Highway Administration was set up to administer the fund. Today, all of that system as Eisenhower envisioned it is in place. In the last 35 years, over $100 billion has been funneled through the trust fund to finance the Federal share of that system.

I think that the point we must understand is that we can not rest on our laurels. In the next 30 years, traffic is expected to double in volume. This includes interstates, inner-city streets, and rural highways. To put this in perspective, in 1989, Americans travelled more than two trillion vehicle miles, more than three times the traffic at the inception of the Federal Interstate Highway System in 1956. Every American who regularly sits in traffic on his or her way to or from work should be disturbed by this trend. For most motorists these days, "rush hour" is an oxymoron.

The Federal Highway System in the 1990s should evolve in a symbiotic fashion with shifting demographics in and around growth areas. There are some communities which are experiencing unbearable traffic snarls simply because they may be only one thoroughfare providing access to the interstate. The city of Festus, Missouri, which is in my district, is dealing with a problem of just this nature. Because of a narrow two-lane overpass on route 21A leading directly from nearby Interstate Highway 55, it creates chronic congestion problems that local residents must fight daily.

We have signs on route 21A that call it "Death's Highway." There have literally been hundreds of people, a lot of them young people, who have met their death on that highway because of its inadequate status, the number of curves, and the lack of access that it provides.

Traffic volume is not the only issue at stake. The nation's growing bridge crisis is an area of concern that is worthy of mention. As you know, almost half of the country's bridges are today deemed to be substandard. I am alarmed to tell you that in our State of Missouri—and I am sure that Congressman Hancock will tell you about this early and often—almost 70 percent of the bridges are considered to be substandard.

Another area that has experienced meteoric growth, especially since deregulation, is the aviation system. I know this because I have been in every major airport in the country in the last few years, in some of them many times. I could never begin to estimate the amount of time that you and I have spent in our lifetime waiting in terminals, on the tarmac, and hovering in holding patterns because of the congestion of our airport and airway system.

According to a recent industry study, the price tag to improve airport capacity to keep pace with demand is over $50 billion in the next few years. Today, 21 airports, including my home airport of St. Louis, experience an average of 55 hours of aircraft delay every single day of the year. Without major capital improvements in the next few years, the Federal Aviation Administration expects chronic delay problems in over 40 percent of the nation's commercial airports. This would affect eight out of 10 people who fly in and out of America's airports.

There are efforts being made by local planners to meet these demands. In Denver, the first new airport to break ground since 1974 is currently under phase one of construction. We read in the paper this morning that there is movement in that area. That is the only new facility now under approval by the FAA, the only one.

There are also substantial expansion projects underway at existing facilities. Our airport in St. Louis currently has a proposal before the FAA to add three new runways and expanded gate facilities. Approval of the project would infuse an estimated $4 billion into the local economy annually. Without it, the airport will simply choke on a capacity problem that is expected to double in volume within the next 20 years. I would suppose that every member here and probably every Member of the Congress could tell a similar story with different facts, different airports, different circumstances, but the same outcome.

As demands on transportation systems increase, finding innovative ways of financing and managing them is imperative. Mass transit planning is one of the most effective ways to deal with congestion in urban areas. Not only is there a benefit in reducing the strain on congested roads, but mass transit policy is a good policy in the area of energy efficiency and clean air. While there are few new-start projects underway right now, there are a couple in the works, like the Los Angeles Metro and the St. Louis MetroLink, which will begin breaking ground very shortly.

Mr. Chairman, now that I have laid out a litany of deficiencies in public structures, let me finally leave the committee today with a more positive assessment of America's potential.

As we begin the decade of the nineties, we have an opportunity to put the focus on the critical areas for improvement. As I said earlier, I applaud the essential work that you and the Members of the Public Works Committee are doing in these various areas. I would also like to state that Secretary of Transportation Skinner has been instrumental and helpful in framing the dialogue on transportation needs. His national transportation proposal, released earlier this month, shows great depth in describing areas that we need to address.

However, I must say that I disagree with many of the Secretary's conclusions. I do not believe that we can address the Nation's needs through the fragmented prism of state and local financing and forsake the federal share of the responsibility. I think it is imperative that we honor our commitment and our responsibility to the country, to the State and local jurisdictions, in joining together in a partnership to meet these challenges.

The public deserves better support for quality infrastructure. We have a solemn obligation to do more than taking a peripheral interest in how these systems are developed and improved. Rebuilding America in the 1990s will be an awesome task. There are no easy solutions.

Ladies and gentlemen of this committee, I believe that we have the good sense, the intelligence, and you have the experience, so that working together, we can meet these challenges. I want you to know that you have a partnership with all of us in the Democratic Party and the Democratic leadership. I am sure that we have a partnership with the Republican leadership on this committee and in the House, hopefully in the Congress as a whole, and hopefully with the Administration as a whole.

We will meet this challenge and rebuild this country. We will send an America to our children and grandchildren that is better built and stronger than the way we found it.

Thank you very much.

The CHAIRMAN. Thank you, Dick, for an excellent presentation. I have a question and I am sure that John Paul will have one or two.

Even though the magnitude of our infrastructure needs is still unknown, it is clear that the problem is national in scope. In the older industrialized areas, the greatest difficulty is posed by aging facilities that need substantial rehabilitation or replacement. In growth areas, existing infrastructure must be expanded and modified to accommodate new residents and new businesses.

Given this national perspective, what steps can the Federal Government take to help State and local governments meet their infrastructure needs? In other words, what should we do?

Mr. GEPHARDT. I think that, happily, we have in place a set of structures, mechanisms, and tools that have allowed us to meet similar challenges in the past. Certainly through the fifties, sixties, seventies, and eighties, we faced a country that had new growing areas, older areas that needed refurbishment, and the Congress and many members on this committee had the foresight to put together a Highway Trust Fund and an Airway Trust Fund, that together with local and State contributions allowed us to meet these challenges in a very forthright and successful manner.

I think that one of the major problems we faced in the last few years has been the willingness of successive administrations to want to be able to use the funds in those trust funds to be applied to the deficit so that the deficit numbers looked better. I think that was not the right policy. It is obvious to all of us that these are truly the only trust funds that have no other current revenues or general revenues in them.

When the people paid these taxes, they only wanted these taxes to go, and they were told that they would only go, to these uses. To now have monies built up in them that are not being used because of other reasons is, I think, the breaking of a contract with the taxpayers and people of this country who have put these monies aside.

I have no problem with ideas on the part of Secretary Skinner or others to put aside new taxes, new revenues to meet these challenges. If you look at what has happened in the States, including my State, they have been passing one bond issue, one tax increase after the other over the last eight or 10 years in order to meet their infrastructure needs.

What I think has to happen now is for the Congress to lead to see if we can free up more of these funds so that we can then go to the states and say, "If you will put up more money to do these things, we will pay our share. We will resume the partnership of the last 30 years and see that these highways and these bridges, airports and airway systems, are built. We will do our part."

I will support, and I am sure that a lot of people in the Congress will support, that kind of local and State revenues in our own districts. I have done that in the past and will continue to do that. But I think that in order to make that ring true, we have to resume our partnership. That is the deficiency that I see in the secretary's statement. That has been the deficiency in our own performance, and I include myself in the blame over the last few years. I think we have got to overcome that.

I have been talking to Members of the Budget Committee; I have been talking with other Members of the Congress about our changing those policies. We are not there yet. I do not come here today to announce anyone's position other than my own, but I really do believe that we are making progress and I think that, working together, we can find solutions to this use of these funds for purposes for which they were not put away.

The CHAIRMAN. Often when people think of the word "infrastructure," they think of pork barrel or potholes. Don't you agree that infrastructure is much more than that? What about economic productivity, growth, competitiveness? What about the quality of life which all Americans enjoy? Aren't these what infrastructure is really all about?

Mr. GEPHARDT. Mr. Chairman, I hate the word infrastructure. I wish we could have it stricken from the dictionary and from our language because I don't think anybody knows what it means. When most people hear "infra," they think of infrared or something else. They don't quite know what you are talking about.

When you say highway or traffic, people know what you mean. If you say airport, people know what you mean. I kind of like the term public structures. People kind of know what that means, although that is not really good either.

I really do think that we have to better explain all of this to people. I get sick and tired of reading articles about how Members of Congress are lobbying for some pork barrel project for their districts. I do not know of any road that has been built or any bridge that has been refurbished or any highway or airport that has been built that has not been to the long-term benefit of the people in the community in which it is built. I don't know of one. If anybody can mention one here today, I would like to hear about it.

I was down in New Orleans over the weekend at the DLC meeting and I rode by the dome they have down there for sports activities and saw all the roads that are around it. I was with someone from Louisiana and I said that I remembered that there were articles in the paper at the time this was built talking about what a boondoggle it was and what a rip-off of the taxpayers in New Orleans and Louisiana it was. There were so many roads that had to be built around it and the articles said it was a boondoggle and a big pork barrel project.

I said that I had not heard much about that lately. Then I asked what it had meant to the economy of New Orleans, and I almost had to shut the man up to get him to stop telling me what it had meant to the economic vibrancy of Louisiana and New Orleans.

We just do not yet have it on how to describe these things to people. I have a friend in Texas who is on the highway commission. They had 10 bond issues in Texas for highways that were refused by the voters by overwhelming majorities. He then went to a public relations firm and an engineering firm to have a study done on how much the average citizen in Texas would save if the ten cent or whatever tax increase was passed in terms of saved time in traffic and efficiency in moving products from one place to another.

They came up with an annual figure. Then they ran a TV campaign with these figures in front of traffic-jammed pictures for people, and they got 82 percent of the vote from the Texas taxpayers. I think that shows that the American people understand these issues if we explain them correctly, simply telling the truth and getting the media to stop characterizing these things in negative terms, which so often happens, instead of putting it in truthful terms so that people can really see what is in their own direct self-interest. Then they can see how paying this revenue, which they have been doing incidentally in the Airport and Highway Trust Funds, is in their own direct self-interest.

The **Chairman**. Thank you, Dick.

Mr. Hammerschmidt?

Mr. **Hammerschmidt**. Thank you, Mr. Chairman, and thank you, Dick, for a very powerful and supportive statement about what this committee is trying to do.

As you know, over the years spending from the Highway, Mass Transit, and Aviation Trust Funds, has been held down in order to make the Federal deficit appear smaller, which you mentioned, even though those trust funds can be used for no other purpose. That trend started with the impoundment of the Highway Trust Fund by Lyndon Johnson. Every president since then has continued that trend.

This new President comes in and says to the Office of Management and Budget, "I've got a $150 billion deficit problem. Should we take $30 or $40 billion out of the transportation trust funds? Should we begin to spend them?" OMB says, "Your deficit is going to be that much larger," so obviously, they have not done it. The Executive Branch has a problem.

Congress has a problem, too. The Depatment of Transportation says, "We have allocated all this money and we don't have any surplus." That is their basic line. But for example, in fiscal year 1990, the State of Missouri can only spend 58 percent of its Federal Aid Highway Funds because of the obligation limitation imposed through the congressional budget process. In other words, Missouri can not spend the $161 million in Federal Highway user fees that have been collected and distributed in the form of contract authority. Obviously, we have the same problem in Arkansas and they have the same problem in California.

In order to try to correct this injustice, our committee has led the charge to take the trust fund off budget. We have come close in recent years, but we have not yet been successful. I heard your comments, but I wonder if you want to comment further on what you see as the prospect for our being able to take these trust funds off budget in the near future. Would you please comment on that?

Mr. **Gephardt**. Let me first say that Senator Moynihan from New York has raised a very valuable argument on the Social Security Trust Fund that all of us are going to have to deal with in the next few months. I suspect that when the budget comes this time, at or about that time, we are going to have legislation on the floor that is going to take the Social Security Trust Fund out from under the Gramm-Rudman limits, freeing the Social Security Trust Fund from Gramm-Rudman in the budget.

When that happens, it seems to me that the next question that has to be asked and answered—and I am positive that we will have amendments on the floor at that time that would take other trust funds out from under the Gramm-Rudman limits. If you take them all out—as you know there are many other trust funds besides Airway and Highway—then you are talking about another $70 or $100 billion, I am told, although the Highway and Airway is only about $15 or $20 billion total.

I think there is a distinction to be made, in my own view. All of the other trust funds, especially Civil Service Retirement, et cetera, have general revenues in them, so you can make an argument that they should not be entirely freed. You can not make that argument about Highway and Airway. There is no money in these trust funds other than the dedicated tax paid by the users. So I think there is a great argument for doing it.

I also believe that if we are going to take Social Security off, then we are going to have to rearrange the Gramm-Rudman targets because no one I know of believes that we can reach balance in the budget by 1993 if you take Social Security out, which is the present Gramm-Rudman path. Everybody is assuming that when you take Social Security off, you are going to have to arrange some new targets, however you do it, whether they are deficit reduction targets or actual deficit targets year by year.

Some people say that you can do it by 1997. Other people say it can be done by 1995. Others even say it can be done by 1994. It depends on how aggressive and ambitious you are about deficit reduction.

It seems to me—and I speak personally now. I am not speaking for the leadership; I am not speaking for the Democratic Party and I am not speaking for anyone other than myself right now. It seems to me that what we ought to try to do is, as we take Social Security off, take off Highway and Airway and add another six months or another year or whatever it is, and rearrange those targets so that you can, as you take the one off, take all three off. Assuming you are going to set up new targets, that would then allow you to set new obligational levels in the budget for those two funds, which would be much more positive and realistic given the nature of the challenge that we face.

For instance—and you can correct me if I am wrong—I think that in the Highway Fund, about $15 billion will come in this year, whereas, in the budget, we are talking about spending $12 billion. I just think that is wrong when you are sitting on a balance that is now, say $15 billion, sitting idle in the fund. I do not know how we justify that to the taxpayers of the gasoline tax.

Mr. **Hammerschmidt**. I thank you very much for that response and for your personal view.

It may be too devastating to the general budget process and to our national economy to do all this in one fell swoop. We may have to find ways to spend down on it, but there have been a number of good suggestions offered.

The aviation people that run airports, AOACI, have suggested that they take trust fund money and leverage it and have bond issues, using it for collateralized bonds—all those sorts of ideas are floating around. As we develop them, I am delighted that we can depend on you as a member to support us, and I hope you will do that with your Majority Leader's hat on in time. I know that you don't make that decision alone, but it sounds very hopeful and we are delighted that you are here this morning to support our efforts.

Thank you, and thank you, Mr. Chairman.

The CHAIRMAN. Mr. Oberstar?

Mr. OBERSTAR. Thank you, Mr. Chairman. I will not persist long because if all of us took our five minutes, we would be here for two hours with the Majority Leader.

I do want to compliment you, Dick, on a splendid, comprehensive, thoughtful statement, a rational consideration of a major national issue. It deserves that attention and your presence here today gives it that attention and stature. It gives it the thoughtful consideration that you bring to debate on all of the matters that we consider.

Just a couple of observations—infrastructure was a word I learned in graduate school in Europe 33 years ago, and I had to say in French. It's difficult enough to say it in English. It's a lot harder to say it five times in a row in French. So let's call it public capital or public investment. Let's call it public productivity because that is really what it means and what it does.

Secondly, on the Interstate Highway System, again, Eisenhower's carrying out of the idea was really a following of a directive of Congress in 1944 which directed a study of a 44,000 mile road network, which had to be sidetracked for a time because of rebuilding the rest of the economy. Eisenhower appointed the Clay Commission, which then modified that idea and came up with 42,500 miles, and then said, "Let's do it in the name of defense."

I think we have to stop the charade of calling public investments good and valuable because they are done in the name of defense. We ought to do them because they are good for America, good for our economy.

Eisenhower did put three points in his message to Congress: relieve congestion, stimulate economic development, and reduce highway deaths, which were then around 40,000 per year. If we did not have the Interstate Highway System, today we would have about 105,000 or 110,000 people dying on the Nation's highways annually. Those three goals are still valid today: economic development, safety, and ending congestion. They are more pressing today than they were in Eisenhower's years.

Taking the funds off budget is valuable and useful so long as we also take them out of the clutches of annual obligation ceilings. Those trust funds have to be able to spend out their annual net cash flow or they do not mean very much. Your road map to get us going in that direction, I think, is a good one. We can not do it all in one fell swoop; it has to be gradual. We have to include in our budgeting a means for accounting for the non-trust fund deficit that will result from taking those funds off budget, and doing it in a gradual fashion is good budget practice, good economics, and good public capital investment.

Thank you.

Mr. **Gephardt**. Just an added point—I don't know if any of you have looked at Senator Sanford's plan on the budget. I read about it the other day and it is very interesting. He says that if you take Social Security off and then isolate the money that we pay as interest on the national debt, you wind up with what is an operating budget. I think he includes Airway and Highway in it, although I am not sure about that. If you did that, you would almost be at a surplus this year on what is the real operating budget of the United States.

I think you ought to take Airway and Highway off as well as Social Security. Then you would maybe have a little less surplus or maybe an imbalance in the operating budget. I think that would give Americans a clearer picture of what is happening in the budget.

The huge outlay now, as you all know, is interest on the back debt. It is about $180 billion per year. That is where our deficit is. I think that would make it a whole lot clearer. Getting this off, I think, gives people a clearer picture of what is actually happening.

The **Chairman**. I know that Congressman Gephardt has to leave in five minutes, so any other questions must be brief.

Mr. Shuster, any questions?

Mr. **Shuster**. Yes, Mr. Chairman.

First of all, Dick, I want to compliment and applaud you for your superlative statement. I think it is absolutely right on target. As you well know, we had three votes over the past couple of years in the House on taking Aviation and Highway Trust Funds off budget. In those votes, the vast majority of Republicans supported doing it; the vast majority of Democrats opposed doing it, including the entire membership of the Democratic leadership. Those are facts and I don't think we ought to put them under the rug.

The thing that just absolutely encourages me is to hear you say that you personally support taking the Highway and Aviation Trust Funds off budget because I think that our chances for getting more money for these programs is absolutely zero until we take that step. And I think that the fundamental solution to our problem, obviously, is more money. The only way we are going to get it is through a bipartisan effort.

I would be quick to acknowledge that we have an educational job to do with some of our friends in the Administration. If we make this a partisan issue, it is going to be very difficult painting the Administration into a corner. It is going to be very difficult to achieve the end result.

I just wonder if you, as the Majority Leader, would be willing to make it a priority project to work for a bipartisan infrastructure program?

Mr. **Gephardt**. Absolutely. I do not see any way that we can achieve our goals without that. That is the way that this committee has worked so successfully through the years.

This is not a partisan issue. To me, there is not really any basic disagreement that I am aware of about building the public investment of our country. I do think that there is a disagreement between people who have different views of the budget and the way the budget ought to work. We are going to have to go through that disagreement. My perception is that we are going to do that this year, and we ought to do it in a bipartisan way.

I understand the view of those who do not want to take it off and they have legitimate, strongly-felt feelings. But let's have the debate on that; let's make a decision on it. I agree with you that until we do it, we are not going to be able to rebuild the country.

Mr. SHUSTER. In closing, I want to compliment you again and extend the hand of help and support to you.

Mr. GEPHARDT. Thank you.

The CHAIRMAN. Bud, what I was going to comment on is that with his remarks, I think he qualifies as an Honorary Member of the Public Works Committee.

Mr. SHUSTER. Absolutely; I'll vote for that.

The CHAIRMAN. Okay.

Mr. Rahall?

Mr. RAHALL. I have no questions of the Majority Leader. I simply want to commend him for providing excellent testimony this morning. He has identified the problems correctly as well as realistic solutions to those problems.

By supporting the removal of these trust funds from the unified budget, you are supporting honesty with the American people, as the gentleman from Minnesota mentioned. If we can spend that money for the purposes for which the American people thought they were paying these taxes, we are being honest with the American people about the true deficit size of our nations.

I commend the Majority Leader for his support of removing trust funds —the unified budget and for his support of using American taxpayers' money to address infrastructure needs in this country. Dick, good statement.

Mr. GEPHARDT. Thank you.

The CHAIRMAN. Mr. Clinger?

Mr. CLINGER. Thank you, Mr. Chairman, and thank you, Dick, for your approach to this issue. It is a very bipartisan, very welcome approach. This committee certainly approaches the infrastructure crisis in a very bipartisan way, and we applaud that.

The Administration has proposed in their budget a beginning of a draw-down on the Aviation Trust Funds, not perhaps to the extent that this committee would like, but at least they do propose that. I think that even if we draw down the entire trust fund, there are clearly major needs over and above what the trust fund is presently generating. So the Administration has proposed user fee increases in this budget in terms of the passenger facility charge, increase in the fee on tickets, and so forth.

Could you comment on that? Would you support that kind of thing, recognizing that the trust fund is not going to meet the whole need as presently structured?

Mr. GEPHARDT. I understand well their position on those other fees and I have said early and often that I would support a head tax; I would support all kinds of things if— and this is the major condition—if we have a clear path to getting these funds out from under the constraints of the budget and if there is a clear, definite, concrete plan that will spend these monies out.

The reason I say that is that I was on the Ways and Means Committee back in 1983 or whenever we did the big gas tax. I remember sitting in the room and asking then Secretary of the Budget Stockman: if we voted for this tax, would the monies be spent out for mass transit, the penny that went for that? Would there be new-starts on mass transit? I asked if the money would be spent on highways. We were assured that it would be. It was not.

So before I am ready to vote for any revenues, taxes, ducks, whatever you want to call them—and I am willing to do it if it goes for infrastructure—I want to see a concrete plan for the spending out of these trust funds. I am not for adding more to mask more deficit.

Mr. CLINGER. Thank you.

The CHAIRMAN. Those were the second bells, but maybe we can have Mr. Bosco very quickly.

Mr. BOSCO. Very quickly, Dick. I will call over and see if they will hold the vote given that you are here with us. [Laughter.]

You touched on something that I think is appreciated in this committee. We are reauthorizing $125 billion or so for the Highway Trust Fund. Members of Congress have come before us, each with projects in their districts, and the media seems to prefer a fairly sterile system whereby we just hand this money out to the different States and they use it as they wish, and anything other than that is considered pork barreling on the part of Members of Congress.

You seemed to indicate that Members should play a role in this, that their ideas on their districts and planning for projects in their communities has importance. To what degree do you think that the Congress and this committee should pay attention to the proposals that individual Members of Congress bring before us?

Mr. GEPHARDT. I think you should. I do not know of anyone who is better in touch with the needs of their districts than the Members of Congress. That is what we are paid to do. We are out there almost every weekend listening to people and finding out what their needs are.

In my own State, my own district, I had to go to the State Highway Commission, which I did on Highway 21. I was responding to the heartfelt worries of parents. They had put signs up on the highway that said that "Blood Alley" was the name of this highway. When we went to the State Highway Commission, they had other ideas of what they wanted to do, but I was able to get them to pay attention.

If you can not have some say in how this money is spent, then I don't know who should. Knowing that you still have to go through your State process and your local process, I don't see that it is any problem that you are able to earmark and make statements in bills and put language in bills that moves things in a certain direction. I think that is what you should do.

Mr. BOSCO. Thank you very much.

The CHAIRMAN. We better recess. I am told that there may be a second vote. I hope we can be back by 10:40, but it may be a little longer.

Let's go vote now and get back as quickly as we can.

Thank you very, very much, Mr. Gephardt, for an excellent presentation.

Mr. GEPHARDT. Thank you, Mr. Chairman.

[The prepared statement of Mr. Gephardt follows:]

Testimony of Representative Richard A. Gephardt
Majority Leader - U.S. House of Representatives
Before the Committee on Public Works and Transportation

March 29, 1990

Chairman Anderson, Congressman Hammerschmidt, thank you for allowing me the opportunity to appear before the Committee today as you begin to examine America's infrastructure needs. You are taking on an ambitious task in holding these hearings as you examine solutions to the many problems in containing America's infrastructure. I commend you for leadership.

It has been said that "a great civilization is not conquered from without until it has destroyed itself from within." This truism speaks volumes about the crisis situation you are exploring today. America now stands at the crossroads: we can either chose the path of disinvestment in the physical structures which encompass the fiber of our economy or we can address the problems of failing infrastructure while they are still at a manageable and somewhat affordable level.

The relationship between economic strength and level of capital investment has been understood for years. We know that severe economic consequences are directly related to traffic congestion and airport delays. So its hardly a revolutionary notion to suggest that unless the decision is made to invest in capital improvements sooner rather than later, a decline in the country's physical capacity will be coupled with a decline in economic growth, and ultimately, a declining standard of living.

The impact of this is far reaching. It even effects competitiveness in international markets. During a period when both Japan and the Western European countries are expanding economically, they are increasing their share of capital investment in relation to overall GNP. The United States, in a period of burgeoning trade deficits is actually reducing its share of capital investment with respect to overall GNP. The United States now ranks 55th in the world in capital investment in infrastructure as a percentage of GNP. How can we expect to market our products half the way around the world when we cannot efficiently transport our products around town? We cannot allow this drain on economic capacity to go unchecked.

At this point, let me turn to specific modes of transportation to understand exactly what we need to do better --

First, on Highways -- As we commemorate the centennial of the birth of President Dwight D. Eisenhower, that we remember his role in creating the federal interstate highway system. In 1955, he proposed a visionary plan to construct a highway system covering 42,000 miles linking every major urban center in the contiguous United States. Eisenhower had carried this notion around with him since his early days in the army during World War I. He recognized the necessity for having a system in place which was efficient for transporting and mobilizing troops. He recognized that economic security as well as military security are linked in efficient interstate system.

When finally implemented, Eisenhower's plan set up the Federal Highway Trust Fund financed by a three cent per gallon gas tax. The Federal Highway Administration was set up to administer the fund. Today, almost all of the Federal Highway system, as Eisenhower envisioned it, is in place. In the last 35 years, over $100 billion has been funneled through the Trust Fund system to finance the federal share of our system of roads.

We cannot rest on our laurels, however. In the next 30 years traffic is expected to double its current volume. This includes interstates, inner-city streets and rural routes. To put this in perspective, in 1989 Americans travelled more than two trillion vehicle miles, more than three times the traffic at the inception of the federal highway system in 1956. Every American who regularly sits in traffic on their way to or from work should be disturbed by this trend. For most motorists these days, "rush hour" is an oxymoron.

The federal highway system in the 1990s should evolve in a symbiotic fashion with shifting demographics in and around growth areas. There are some communities which are experiencing unbearable traffic snarls simply because there may be only one thoroughfare providing access to an interstate. The City of Festus, Missouri in St. Louis County is dealing with a problem of just this nature. Because of a narrow, two-lane overpass on Route 21A leading directly from nearby Interstate 55, it creates chronic congestion problems that local residents must fight daily.

Traffic volume isn't the only issue at stake, however. The nation's growing bridge crisis is an area of concern that is worthy of mention here. Almost half of the country's bridges are deemed structurally substandard. And I am alarmed to tell you that in the State of Missouri, almost 70 percent of the bridges are considered substandard to some degree.

Another area that has experienced meteoric growth, especially since deregulation, is the aviation system. I know this because I have been in every major airport in the country in last few years -- some of them many times over. I could never even begin to estimate the amount of time I have spent in my life waiting in terminals, on the tarmac, or hovering in holding patterns because of congestion.

According to a recent industry study, the price tag to improve airport capacity to keep pace with demand is over $50 billion over the next five years. Today 21 airports, including my home town airport, Lambert Field in St. Louis, experience an average of 55 hours of aircraft delay every single day of the year. Without major capital improvements in the next few years, the Federal Aviation Administration expects chronic delay problems in over forty percent of the nation's commercial airports. This would affect eight out of 10 people who fly in and out of U.S. airports.

There are efforts being made by local planners to meet these demands. In Denver, the first new airport to break ground since 1974 is currently under phase one construction. But it is the only new facility now under approval by the FAA.

There are also substantial expansion projects now underway at existing facilities. St. Louis Lambert Field currently has a proposal pending before the FAA to add three new runways and expanded gate facilities. Approval of the project would infuse an estimated $4 billion into the local economy annually. Without it, the airport will choke on a capacity problem that is expected to almost double in volume within 20 years.

As demands on transportation systems increase, finding innovative ways of managing them is imperative. Mass transit planning is one of the most effective ways to deal with congestion in urban areas. Not only is there a benefit in reducing the strain on congested roads, mass transit policy is good policy in the area of energy efficiency, and clean air. While there are few new-start projects under way right now, there are a couple in the works: like the Los Angeles metro, and the St. Louis MetroLink, which will begin ground breaking very shortly.

Mr. Chairman, now that I have laid out a litany of infrastructure deficiencies, let me finally leave the Committee today with a more positive assessment of America's potential.

As we begin the decade of the nineties, we have an opportunity to put the focus on critical areas for improvement. As I said earlier, I applaud the essential work you and the Members of the Public Works Committee are doing in these various areas. I would also like to state that Secretary of Transportation Skinner has been instrumental in framing the dialogue on transportation needs. His national transportation proposal released earlier this month shows great depth in describing areas that we need to address.

However, I disagree with the Secretary's conclusions. I don't believe we can address the nation's needs through the fragmented prism of state and local financing and forsakes the federal share of the responsibility. I think it is imperative that we honor that responsibility. The public deserves better support for quality infrastructure. We have an obligation to do more than taking a peripheral interest in how these systems are developed and improved. Rebuilding America in the 1990's is an awesome task. There will be no easy solutions.

In closing, I thank the Committee for inviting me today and I look forward to working with you in the coming year.

###

[Recess.]

The **Chairman**. The committee will come back to order.

At this time I would like to welcome the House Minority Whip, the Hon. Newt Gingrich. Newt is no stranger to this committee. Until his election to his leadership position, he was the Ranking Minority Member on our Aviation Subcommittee.

He has provided valuable leadership in the area of infrastructure and we look forward to continuing to work in a bipartisan fashion on this essential national issue.

Bud, I'll bet you would like to say something.

Mr. **Shuster**. I want to welcome our good friend and colleague from the committee. There is that TV show, "Can you Top This?" Well, we had the Majority Leader here a few moments ago and he had some very, very positive, encouraging things to say about supporting the efforts of this committee.

Now, we turn to the distinguished Republican Whip because I know he can top that.

TESTIMONY OF THE HON. NEWT GINGRICH, A REPRESENTATIVE IN CONGRESS FROM GEORGIA

Mr. **Gingrich**. Let me first thank the committee for letting me come over here. As you know, I am on leave while serving as Whip.

The **Chairman**. I was hoping you would point out that I walked all the way back with you to make sure that we had you here.

Mr. **Gingrich**. A most prestigious escort, the Chairman of this Committee, who ensured that I got off the Floor and away from the list of members who needed things done.

I also want to welcome Susan Molinari. I served with your dad, and it is wonderful to have you here.

I also want to commend Dick Gephardt. I sat through virtually all of his presentation. I read his statement and I thought it was appropriately bipartisan in the tradition of this committee, and I thought it laid out the general direction in a good way.

There are enormous, even dramatic, infrastructure needs, public safety and health involved in things like unsafe bridges, requirements of the aviation system, waste disposal problems, quality of life involved in things like rush hour traffic in our major cities, and competitiveness in the world market. If our transportation system collapses, we are not able to compete in the production of goods and services.

Our needs are so great that we must rethink from the ground up what we need and how to approach those needs. For just a couple of minutes, I want to risk sounding professorial and academic and ask my colleagues in this committee to indulge me. I would like to suggest a few principles for the committee, the staff, and the interested public, for approaching the challenge of infrastructure in the nineties.

I served actively on this committee for 11 years. One of our problems, it seems to me, is to develop a pattern that will in fact attract public attention, become politically, overwhelmingly desirable, and will, therefore, get implemented so that we change the pattern of infrastructure investment in the United States.

To do that, I want to suggest that the committee approach the whole question of infrastructure for the 21st Century from the standpoint of a planning model of four points. At the top of this model is vision. What is our vision of a competitive, safe, healthy, quality of life for America as it relates to infrastructure?

Then, what are our strategies to achieve that vision? Then, having carefully thought through our vision and strategies, what are the specific projects that we ought to support and what are the tactics that we ought to implement on a daily basis? I think what happens to us in infrastructure is that we get so tied up in a specific tactical detail, this interchange, this bridge, this waste water treatment plant, that we don't spend the time and energy necessary to develop at the vision and strategies level a general public understanding of where this country is.

I want to talk for just a few minutes at the vision level of how we must reorganize, because I think we are at the end of an era. The world market, the technological revolution, and the collapse of the bureaucratic welfare state as a delivery system, I think, has put us into a new era. At the risk of sounding professorial, I want to cite for those people who are really interested in digging into this, that if you read Peter Drucker's "The Age of Discontinuities," Alvin Toffler's "The Third Wave," a book that Mary Anne and I wrote called "Window of Opportunity," Hernando de Soto's "The Other Path," and in particular, the introduction by Mario Vargas Yosa, who is the poet laureate of Peru and is now the front-runner in the race for President, Paul Johnson's "Modern Times," Salem's book, "New York Unbound," or Nesbitt's "Megatrends 2000," you will find that all of them describe a very similar pattern, that we are at the end of an era of behavior and we are in a transition, entering a new era.

One of the documents that I would ask permission to put into the record that I think helps summarize this in a relatively few pages is a speech by Jim Pinkerton, Deputy Assistant to the President for Policy Planning. It is a speech he gave to the World Future Society on February 8, 1990, entitled, "The New Paradigm." I suggest this to every interested citizen because Pinkerton, who really does, I think, the long-range planning for George Bush more than any other single person, has worked very diligently to try to put together a way of thinking about where George Bush wants to carry us.

I think that the odds are fairly good that George Bush is going to be President for almost seven more years. So it is useful for us as we develop an infrastructure strategy, to understand where he is trying to go and then to get him to carry our infrastructure strategy with him, rather than getting involved in a head-on fight.

Pinkerton suggests five specific principles of what he calls the new paradigm or new model. First is that government is subject to market forces in a way that it did not used to be, that because of the rise of the world market, capital can flow so quickly that countries that are smart attract new money, countries that are dumb lose money.

I would suggest, for example, that you look at what is happening right now with the yen and dollar relationships despite the best efforts of the Japanese Central Bank. I also suggest you look at some of our biggest cities which raise taxes and lose business. You look at the way in which people make decisions about where to place their next company or their next factory.

Secondly, the Bush revolution will focus on increasing individual choice, that wherever possible, we are going to want to maximize individuals' choices about what they are doing. Third, since a lot of people do not have adequate resources themselves, we are going to want to empower people so that they have the resources to make choices.

For example, if you look at today's debate on child care, both the liberal democratic bill and the bipartisan, more conservative bill have very strong earned income tax credit provisions. Both of them are a new approach to getting money directly into the pockets of parents rather than the more traditional bureaucratic welfare state approach. Again, as you approach infrastructure and transportation, you may want to look at this empowerment issue in that context.

Fourth, Pinkerton argues that decentralization is going to play a very, very major role, that as much as possible, we are going to recognize that whether it is Albany, New York for the State of New York or it is Atlanta, Georgia for the entire State of Georgia, or it is Washington for the entire country, that the more centralized decisions are, the less likely they are to be responsive in real time to what is happening. In a sense, what Gorbachev has discovered in the Soviet Union with Perestroika, that you can not run a command bureaucracy in the age of the information revolution is as true for the United States as it is for Russia.

In that sense, to our newest member I would say, it is better for Staten Island to decide its fate than for City Hall. It is better for Brooklyn to decide its fate. We are in fact reversing the trend which began in the 1890s when the boroughs came together to form the Greater City of New York.

Finally, it is Pinkerton's assertion that the new paradigm will emphasize what works, that it will look around the country and take specific examples of what is succeeding. Let me suggest—and I would like to ask to enter this in the record, also—that if you look at pages 171–180 of the President's budget, it is a chapter by Dick Darman entitled, "Advancing States as Laboratories." (See page 50.) He walks through in this chapter, which has not been read by many people, a section on transportation, a section on education, a section on combating poverty, a section on health, a section on the environment, a section on child care, and in each case he lists examples of experiments underway around the country at finding new approaches that work.

In the President's one page introduction, it seemed to me that the President raised themes that fit precisely our commitment to infrastructure. (See page 49.) There were five of them. First, investing in our future. I think that precisely what public works is about is investing in our future.

Second is advancing States as laboratories, and that goes to the point of decentralization. Third is reforming mandatory programs. I think that goes to choice and empowerment. Fourth is acknowledging inherited claims. Let me state that those inherited claims include our current solid waste problem, our water needs, our transportation requirements, as we complete the Interstate System of maintaining that system, and finally, managing for integrity and efficiency. There, I think, all of us who want adequate infrastructure have to recognize that all too often the bureaucratic welfare state has not been successful in developing that.

To summarize, we are working on a nonpartisan model of this change, building upon Pinkerton's new paradigm model, and on May 19th, we are going to have an hour-long television show outlining that model. Essentially, it can be summarized as applying common sense focused on success and opportunities. Let me apply these principles very briefly to infrastructure.

I think the committee should start at the vision level and should try to solve four questions. First, what does public safety, quality of life, and the requirement to compete in the world market for jobs and pay require in infrastructure? This country has to be made to confront the scale of investment that the next 20 years will require if we want the kind of America that we need.

Second, how do we invest in research and development and technology to meet those needs with both private and public research and development? Here, what I mean if I may be candid is: I think that all too often when we say infrastructure, we mean building highways the way we always have, building water systems the way we always have, building more landfills, but I will give you five quick examples.

Electronic highways are going to have more and more people working at home and accelerating the development of those electronic highways may do as much to simplify Los Angeles at rush hour as the next two lanes of a super highway. The whole development of the V-22 and the development of vertical takeoff and landing aircraft, developing a next generation, very short commuter system, may have a tremendous impact on short distance commuting in places like the Northeast.

Third, we have to have a strategy that emphasizes recycling to minimize solid waste buildup. Frankly, that means that we on Public Works have an obligation to draw in Ways and Means and to draw in Science and Technology to develop a unified effort to shift the advantage in the market place toward recycling and away from other systems.

Fourth, we need long-term low repair construction techniques. The next generation of highways and bridges ought to be a quantum leap in terms of our construction capability, at least comparable to the changes we see in aircraft and in cars. Currently, we see very little dramatic change in construction capabilities. Finally, we have to investigate things like using magnetic levitation in the northeast corridor, Florida, and southern California to give us the kind of high speed future we want.

As a general principle, how do we maximize entrepreneurial free enterprise and a decentralized market-oriented force both to generate capital for investment and for management? I would suggest, for example, that the FAA's management of the NAS plan starting with its failure at the architectural design level, is an example of the fact that very often big government simply does not get the job done very well. I think that one of the things I would hope that this committee will take seriously is producing not necessarily the Skinner version but what the Congress' version ought to be of a much more market-oriented, much more entrepreneurial, and much more decentralized system of creating new opportunities for infrastructure development.

For all of the 19th Century, most of American infrastructure was privately developed. It is only in the 20th Century that we decided that model did not work. I think that there are at least grounds for experiments on a fairly grand scale, and we want to think through how to legalize those and empower them.

Finally, how can we develop a 10 or 20 year commitment that is inclusive in terms of scale but is decentralized and flexible in implementation? The genius of the Eisenhower model that Dick Gephardt cited was that he said here is one program with one funding source which will go on permanently until it happens. So for over 20 years, we have built the modern highway system.

Let me suggest that in a sense what we want is the 1990's investment in American safety, convenience, and competitiveness to create the 21st Century quality of life we want. Somewhere in some kind of large overview title, we have to bring together everybody who cares about solid waste, everybody who cares about water, everybody who cares about transportation in all of its various forms, and create a coalition that understands that investing in infrastructure is as important to America's future as any other investment we will make.

Let me close with this one specific topic because I suspect that it is one you will ask me about immediately. I believe that we should focus a lot of energy on tying any trust fund and Gramm-Rudman changes with Social Security to infrastructure. I think it is fully as legitimate for the trust fund payer, who is after all paying for an investment in their convenience, which is what made it different from normal general taxes—it is just as legitimate for that person to complain about their trust fund being used as it is for the FICA taxpayer to complain about the FICA Trust Fund being used.

I would hope and I would support an effort that said, if we are going to modify the Gramm-Rudman targets to recognize that we are taking Social Security off budget, and we are going to modify the Gramm-Rudman targets to get to a balanced operating budget, then we ought also to take the transportation trust funds off budget and put them in a place where they could be spent as a true capital budget for the first time and get us back to the pre-Lyndon Johnson approach where the capital budgets are clearly seen as different and the trust fund budgets are seen as different than the daily, annual operating budget of the Federal Government. I would be very supportive of this committee if it decides to move in that direction.

I appreciate your allowing me to give you a general framework of thought. This is a great opportunity for me and I am very grateful.

I will be glad to answer questions. Thank you.

The **CHAIRMAN**. You almost answered the question that I am going to ask you, but I want to develop it a little bit.

Earlier, we heard Dick Gephardt pledge his personal support to work with the Congress in taking the transportation trust funds off budget. Can we count on you to work with the Administration to join in this effort?

Mr. GINGRICH. I am very committed to working personally. I will do all I can to convince the Administration that this is the right way to go. As a member on leave from this committee, I would feel very, very bad about having to walk back in this room not having done something that I believed in and worked for for 11 years.

The CHAIRMAN. I have not let you off of this committee entirely.

Mr. GINGRICH. I know that I am only on leave and I intend to return. This is a position that I have been very forthright in, Mr. Chairman, in bills that you and Mr. Shuster have cosponsored. I have worked strongly on this issue before. We have had very good test votes on the House Floor and have come very close.

I believe as strongly in this issue today as I did two years ago. I will do all I can to help you, and I would fight for a rule to make an order—one vote—that whatever we do on Social Security also applies to the trust funds.

The CHAIRMAN. Mr. Shuster?

Mr. SHUSTER. Thank you very much.

I have no questions. I just have the greatest regard and respect for our colleague and appreciate his testimony today.

The CHAIRMAN. Mr. Oberstar?

Mr. OBERSTAR. Thank you, Mr. Chairman.

I want to thank our colleague and now distinguished Minority Leader for lending the stature of his office to the effort of this full committee on the broad general issue of infrastructure or public capital issues that are encompassed and envisioned in this whole series of hearings.

I recall very well the hearings that we chaired together in the Investigations and Oversight Subcommittee that, in a sense, laid the groundwork for this continuing effort. I appreciate the very strong commitment on the capital budget's trust funds off budget.

I would say off budget with a plus, however, without the meddlesome hand of the Appropriations Committee to impose obligation ceilings. It does not serve the purpose of those trust funds if the Appropriations Committee can then impose limits on how much money can be spent rather than allowing the free flow of demand on the current annual cash flow of the trust fund for the purpose for which it is intended.

If I remember correctly back to the Johnson era, President Johnson put limits on the amount that could be spent out of the Highway Trust Fund because of his concern that construction was heating up and driving inflation. He imposed obligation ceilings, which have subsequently been used for other purposes. Why we pick on one sector is beyond me, but I think it is self-limiting to say that we will take the trust fund off budget but it will still be subject to the overall limitations of the Appropriations Committee.

I would like to have the gentleman's response to that.

Mr. GINGRICH. It seems to me that this would have to be crafted carefully so that the law as enacted was quite clear on it. To eliminate the Executive Branch's limitations as part of a unified budget only to replace it with an Appropriations Committee limitation would be self-defeating. The purpose here is to say that the trust funds are paid into in order to rationally, in a managed way, invest in infrastructure at the optimum return on the dollar invested. It ought to be done almost as an engineering technical problem of what is the rate of spend-out which gets us the most infrastructure per dollars spent.

To politicize that in order to meet some kind of annual budget cycle is nonsense, in my judgment.

Mr. **Oberstar**. Thank you, I appreciate the gentleman's response. He sees the issue in a viewpoint I share.

I don't want to allow to pass the obiter dicta of the gentleman on individual choice, decentralization, electronic highways, long-term low repair construction techniques—some of those are well-intentioned thoughts that the gentleman has, but if we decentralize the highway program anymore than we have, we will be back to 13th Century England when each landowner was responsible for the patch of route in front of his or her property. I don't think we want to carry decentralization that far. The degree of decentralization that we have in the highway program today is probably sufficient. In some cases, maybe it goes a little too far.

Mr. **Gingrich**. May I comment on that?

Mr. **Oberstar**. And I am for electronic highways, but I do not think it is going to eliminate congestion. My wife operates a small consulting program with a fax machine and computer and telephone, and she can do it out of her home. In that way, she removes one person from the highways, but I think it is going to take a little bit more than that to reduce congestion.

Mr. **Gingrich**. I am not suggesting a panacea. What I am suggesting is that—historically, if you go back to the 19th century and look at how some of our committees were set up, they are very interesting because they refer to a world that is now gone. Committees that were once very important do not exist anymore. You can imagine, for example, that at the beginning of the rise of the railroad, the Conestoga wagon folks did not quite understand whether or not this was an important enough issue to worry about.

All I am suggesting is that as we think of infrastructure, then we ought to think of the totality that is possible in the early 21st century and we ought to recognize whether it is encouraging Northern Minnesotans to compete in the world market electronically as well as physically—again, Mr. Shuster knows vastly more about this than I do and was quite successful in a prior career at using some of these breakthroughs in a way that has been helpful to his entire life.

All I am suggesting is that I think your staff and you have a unique moment in time here, to help America think about the next 20 years. You should think as broadly as possible.

On decentralization, let me give a specific example that relates directly to this committee. We had a nine month fight with the EPA Regional Office to get a dam built which had been designed according to EPA specifications before they changed it. We had to go back through the whole mess.

When we have bureaucrats who are now so bound up in red tape that you can get the Corps to agree to something, get EPA to agree to it, and then Fish and Wildlife isn't sure, so you suddenly wind up in a total mess where your local officials come to you and say, "Why would you run for county commission to spend the rest of your life being frustrated by some guy who never won anything, has never been in my county, and whose only relationship to us is that he checks the box that says not approved?"

I was thinking of infrastructure not just at the highway department level, but the totality of where I think you are looking at infrastructure. There are places where maybe the Federal Government has overreached in the level of paperwork and the level of decision-making that have been taken away from local officials. That was my only point.

Mr. **Oberstar**. The conflict resolution mechanisms of the kind that we ultimately worked out among the four agencies, Mr. Clinger and I in the I&O Subcommittee, to resolve questions of that nature in wetlands definition and regulation, are a way to achieve that goal.

Mr. **Gingrich**. Exactly right.

Mr. **Oberstar**. I am glad the gentleman clarified.

Mr. **Shuster**. Would the gentleman yield?

Mr. **Oberstar**. Yes, happy to.

Mr. **Shuster**. Apropos of Mr. Gingrich's remark, at the turn of the century when Congress appropriated $100,000 for aviation research for the first time, John Jacob Astor said it was an absolutely disgraceful waste of the taxpayers' money because everyone knew that aviation would not be good for anything except circus stunts.

Mr. **Oberstar**. There have been shortsighted observations of that nature throughout our history——

Mr. **Gingrich**. I rest my case on Mr. Shuster's brilliance.

Mr. **Oberstar** [continuing]. But the gentleman from Georgia would never subscribe to such a narrow view, however.

Thank you.

The **Chairman**. Mr. Hancock?

Mr. **Hancock**. No questions, Mr. Chairman.

The **Chairman**. Mr. Nowak?

Mr. **Nowak**. Thank you, Mr. Chairman. I just want to welcome our colleague before the committee and say that his interest in this area is welcome as we try to put together a broad infrastructure package. My Subcommittee on Water Resources has been involved with that issue that you just mentioned on the wetlands, trying to get a definition of what is a wetland and trying to bring those agencies together so that they work in concert and not at cross purposes when developing a good program in a specific area.

I just want to mention one overall kind of concern I have had because I think it bears on this whole infrastructure problem in the budget when we look at the overall deficits that we found ourselves in. As you know, we do not keep a capital budget separate. The comparison is always made that the States and local governments have "balanced" their budgets. What they don't state, however, in that balancing is that they paid the interest on bonds that were issued for everything from state dormitories for students to jails to office facilities and other capital projects in their States or in their cities and where we carry out a check, if you will, when a project is completed and pay off a general contractor who hopefully pays off some of the subs and gets that road or that bridge completed.

That year, we are out of it. We have no "bonded indebtedness" to carry forward. That all becomes enmeshed in the general deficit that everybody looks at, yet when I have talked to some of the "Big 8" accounting firms, they will state that we really should divide the capital up. If you looked at everything that we built that is going to last more than one year that is not O&M, you are probably talking in the area of $60–$70 billion if you include the military construction. I suppose a tank is going to last for more than one year. Certainly the bridges and the vast amount of public treatment plants that were built to a large degree with Federal money, are still operating and will operate for perhaps 30 to 40 years and then some with re-tooling at varying intervals.

The point I am making, of course, is that if we took away the investments, the pure, hard dollar investments we made in our economy and in infrastructure in long-term projects, our deficit would not have the glare to it, at least the straight number amount, that it would if you don't consider the capital investments you have made. We are still struggling, I think, to find a way to even that out and have the Administration look at a capital approach so that we can get a truer value on what our "operating deficit" really is.

As General Motors builds their new plant in Tennessee—they did not pay for that in cash. They went out and bonded it, yet we make that comparison in the private sector. I think that we have to really start to realize that there is a difference in capital Federal expenditures and operating expenditures.

I hope that we will be able to make some efforts in a bipartisan way to bring about that kind of focus. I think it would really give everybody a much better picture of exactly where we are in this country and what we are going to have to do to the infrastructure and the difference between a Federal long-term expenditure or investment and another program that is out there being consumed every fiscal year.

Mr. GINGRICH. If I may respond—I think that Mr. Nowak is exactly on target. First, there is no business firm in America that would use this kind of system. It is a crazy system to use.

Second, the way the current system operates, it is biased against long-term investment because it overvalues the cost of long-term investment and undervalues the cost of recurring things. It builds in a bias against the next highway, against the next water project, in terms of its true payout, which may well be 20 to 40 years.

Third, I think it would be very helpful in moving the Administration in the right direction to have some folks put together the right kind of capital budgeting bill, to go to the Big 8 firms and say, "If we are going to be in favor of entrepreneurial free enterprise, how would you design Federal capital accounting to amortize it?" I think that kind of bill might well be a bipartisan project and might in fact give the Administration something to work on that they have to think about intellectually and respond to.

Mr. NOWAK. I would be happy to join with you in trying to devise that kind of enquiry and see where we go. I am sure that my staff and the staff of Public Works would be more than willing to join in that effort as soon as we could possibly have a dialogue about it.

Mr. GINGRICH. Good.

Mr. Nowak. Thank you.

Thank you, Mr. Chairman.

The Chairman. Are there any other questions?

Mr. Bosco?

Mr. Bosco. Thank you. I will be brief. I know that Mr. Gingrich has other business, especially today when we have so much important legislation on the Floor.

I feel, Newt, that you have struck upon an extremely important point with the amount of time and money that is spent in these duplicative and excessive regulations, some by the Federal Government, some by the States, some by both. Last week or so, we had a number of the State highway directors before us and I asked them: of the money that we appropriate to you, how much is spent in those types of regulatory morasses? They said that amount was 25 percent of the money. We are talking here about a maybe $125 billion bill, so over 25 percent of that is going to be spent not paving a single inch of road or tarmac for an airport or whatever.

Do you believe that it would be wise for us to consider allowing a State preemption in this regard, that when we decide to build a Federal facility, we would allow the State environmental laws to in effect dictate what happens in that State?

Mr. Gingrich. I think that we ought to set a much broader framework for what the Federal Government mandates and then say, "As long as you are inside this box, you solve it." I taught environmental studies and I am not about to advocate that we allow the least environmentally aware State in the country to have its own toxic waste program creating a long-term liability for all of us. Nor would I suggest that you want to set a standard for construction of the interstate highway system that gives you 50 different safety standards.

But once we have defined a general pattern of the values we want achieved, how you get to those values and how you decide within that framework to apply your own specific nuances, I think, should clearly be up to each State. I think that we should recognize that the requirements of Alaska are hardly the same as the requirements of Florida.

Furthermore, the more you bureaucratize the system, the dumber it gets. The more you take incentive away from the local entrepreneur and the local manager and the local decision-maker until they become paper shufflers, the more you create a blandness and a lack of creativity and a lack of drive and energy, which I think now enervates the whole system. You probably see it in education more than transportation, but you see it across the whole country. The bureaucratic welfare state is grinding down the common sense and initiative that used to be the hallmark of being American.

I would recommend to the committee that as you look out over the next year or so of developing this infrastructure process, that you go back to the States and also to the local communities, to the Association of Mayors, Association of County Commissioners, and you ask them to propose the reform bills that they would have to debureaucratize America. What is it that they collectively can work out? It's not that you are going to accept it, but get the customer at the bottom who is the one most affected to spend some time saying, "Gee, which of these are just plain dumb?" Have them come in so that you have the muscle of the county commissioners and the muscle of the city governments and the muscle of the State governments as part of your infrastructure momentum.

Mr. Bosco. But you would suggest a threshold above which every State must be?

Mr. GINGRICH. Sure. I think that the Federal Government can legitimately expect certain thresholds of honesty and accuracy that we have to be aware of and have to look at.

Mr. Bosco. Thank you.

The CHAIRMAN. Mr. Payne?

Mr. PAYNE. I just want to thank my colleague for what I think was a very thoughtful and well-prepared presentation to us. A presentation like that takes a great deal of time and I appreciate your taking the time to do that.

I had one question related to something that Dick Gephardt touched on, having to do with educating the public in order for this infrastructure movement to really be successful. That is where it really needs to take hold. He mentioned an example where a bond issue had failed miserably, apparently, and once there was some education done, it passed rather overwhelmingly.

Could you just comment on your thoughts about that subject and the necessity of further education of the public?

Mr. GINGRICH. I would be glad to, and I appreciate your comments, Mr. Payne. I am a little cautious because I hope that what I say will not in any way be seen as being offensive or smartaleck.

Public Works has historically had a pattern of being relatively not just bipartisan—it is a wonderful committee that taught me an immense amount about how to work with my colleagues on both sides of the aisle—but of being such a positive committee. The pattern, I think, of public works development in America has overall been such a positive pattern that we tend to not be very dramatic. We tend to be not very good at communicating our messages.

If you compare the next story on "60 Minutes" about the homeless and the next story about education and the next story about health care and then you get around to the bridge, you will see that the only bridges that make it are the ones that fall down. That is seen as a tactical event, not as part of a vision and strategy problem.

We are not very good because we get up—this is a committee, frankly, which gets together and tries to think through in the most practical way: how do we build a better America? I have been through these hearings as you have, and we look at where do we need a water project and where do we need a highway interchange? These are very practical, very detailed problems.

We are not necessarily the greatest producer despite the fact that both a former member of this committee who became Speaker, and your current witness who became Whip, are both pretty good at making speeches. In terms of public works and infrastructure, we are not naturally very dramatic.

Part of the reason I came in today to give you what I think was probably a little different testimony than I might have—it was frankly shaped and helped a great deal by staff work on our side at briefing me on what you are looking at. I am convinced that we have a chance if we take it really seriously, to put together a new approach, a new package, and a new alliance across this country to reach out to people.

I will give you a slight improvement on former Speaker O'Neill's dictum that all politics is local. I believe that all politics is personal. I believe that when you are sitting in that car for your second hour in a traffic jam in Los Angeles, you understand why it is important that Glenn Anderson is Chairman of this Committee and you are glad that he is doing something about traffic in Los Angeles. I think that when you are sitting in Northern Minnesota and you are looking at a real problem as a farmer and you know that the work that Arlan Stangeland did in the Red River is directly affecting your life, then you understand this committee.

However, we have not found a mechanism to bring together all of those personal needs into a general program. I cited the Eisenhower example because it was a work of genius. People underestimate Eisenhower. He was one of the two members who led the first Army cross-country convoy in 1919. Eisenhower's vision of a nationwide highway system had been there for almost 36 years before he gave that speech. He tried to think through the question: how could he build a structure so big that after he ceased being President, it would still just move forward in a grand way?

I think that the challenge to this committee is to come up with a vision of infrastructure in America. I listed the three keys: public safety, quality of life, and competitiveness in jobs and take-home pay in the world market. If you can put together that package so that we can then bring everybody into one big arena, who for their own reasons, whether it is in Buffalo or Fort Worth or Virginia, decide that this will improve their lives, then we can pass the capital budgeting that Mr. Nowak is so correct about and we can pass the trust fund budgeting that the Chairman is so correct on.

I think it has to be done that way. It is the link between general vision and my life. That is not a habit that we in Public Works have been good at, frankly.

Mr. **PAYNE**. Thank you very much.

The **CHAIRMAN**. Mr. Stangeland.

Mr. **STANGELAND**. Thank you, Mr. Chairman.

Newt, I am sorry that I was not here to hear your presentation or the presentation of Mr. Gephardt before you. They had a markup of Wheat.

In listening to your discussion with Mr. Bosco, I wondered if I can phrase what you somewhat have in mind. You talk about the inertia or the buildup of resistance in the bureaucracy.

We had testimony here the other day from the scientific community, MIT to be exact, on waste water treatment. They have designed a way to replace secondary treatment of waste water and it is not approved. There is a requirement by EPA that municipalities and cities build secondary treatment plants. Secondary treatment for Boston cost billions and the O&M is $1 million a year.

Their testimony was that they seemed to think that through chemical treatment they can take care of that waste water for about $1 million a year, the same as the O&M of the secondary plant. I am wondering if that is kind of what you are talking about, that if this is going to go—and I will have an amendment on it—we have to find some innovative ways to not do it the way we have done it for years at horrendous cost because that happens to be the way we did it for years?

Mr. GINGRICH. Arlan, I think you are exactly on target with what Mr. Bosco was trying to get at. We should say, "Here is a standard that we want met." If you will come in and certify—it is almost like a bonding process—if you will certify that you are going to meet that standard, then it is not our business to have an engineer who is sitting in a bureaucracy down here who last did creative engineering 25 years ago read your paper and decide whether or not it fits his paper. We want to accelerate the introduction of new technology and new market-driven approaches, not minimize them.

Right now we have a system, if you think about it, where one of the two or three greatest institutions in America for technology has to come to us to get an amendment to make possible an improvement. That is the Congress acting as a city council, and that is nutty.

I think that we need to put the monkey back on the back of State and local governments to advise us: here, within a framework of quality, is a way that you could liberate us and empower us so that we can make decisions again. I think we could have a terrific alliance in this country if we combined our drive for infrastructure with their desire for decentralization so that both were voting for the same bill.

Mr. STANGELAND. I think that what you are basically saying is that that local city council or that State government is every bit or more concerned about the well-being and the quality of life of its constituency as some Federal bureaucrat out here. This Federal bureaucrat out here is not a know-all, see-all, do-all. There can be and ought to be that input and that trust to that locality and State, with some guidance.

Mr. GINGRICH. That's right.

Mr. STANGELAND. Thank you very much.

Thank you, Mr. Chairman.

Mr. EMERSON. Mr. Chairman, I wonder if I might comment at this point?

The CHAIRMAN. Mr. Emerson.

Mr. EMERSON. I, too, apologize for having been unable to be here to hear your statement and that of the Majority Leader. I have heard some comments on it. I understand that Mr. Gephardt made an outstanding statement. I was glad to hear your recap here in response to the gentleman from Virginia. I liked what I heard you say.

You know, another barrier that I think we have to overcome as we address this problem is that concept of what this committee deals with as pork. That irritates me every time I hear it. There is a big difference between pork as the public perceives it and addressing the real infrastructure needs of this country. Anything that any of us can do to dispel the idea that Public Works and Transportation is somehow an apparatus for dispensing pork will move the cause forward.

I am also somewhat intrigued at times when I hear conservative Republicans, which I consider myself to be—it seems that some conservative Republicans think that it is somehow un-Republican to be for public works and infrastructure improvements. I always delight in trying to remind our colleagues that the Whig antecedents of the Republican Party were largely established by Henry Clay, who had the nickname of "Old Capital Improvements Harry" for the work that he did as a long-time leader in the Congress at trying to help us gain access to the West.

Abraham Lincoln spent virtually his entire career in the Illinois Legislature trying to devise a system of canals for the State of Illinois, which was a state of the art technology at the time. It was quickly overtaken by the railroads, but nonetheless, it was a worthwhile cause as he pursued it. That goes down to and includes the vision of President Eisenhower in having the dream of and the wherewithal to implement what we now know as the Federal Highway System.

I think there are some old shibboleths, as it were, that we have got to overcome as we advance this debate. I liked what I heard you say, that this debate must move forward the real needs of this country in a transportation and infrastructure sense in a bipartisan fashion. We know that this Committee on Public Works and Transportation is very largely bipartisan in character and nature. I hope that as we address the serious business before us this year and ahead that we may proceed in that way.

I thank you and Mr. Gephardt for the contributions that you have made to this discussion.

Mr. GINGRICH. Thank you.

Mr. Chairman, I would ask unanimous consent to put the budget section and the Pinkerton speech into the record after my testimony if that is all right with the committee.

The CHAIRMAN. No objection, so ordered.

Mr. Geren, did you have a question?

Mr. GEREN. No questions, Mr. Chairman.

The CHAIRMAN. Newt, thank you very much for an excellent presentation.

Mr. GINGRICH. Thank you all very much.

[The following were received from Mr. Gingrich:]

I. THE BUDGET MESSAGE OF THE PRESIDENT

To the Congress of the United States:

I have the honor to present the *Budget of the United States Government for Fiscal Year 1991.*

The American economy is now in its eighth consecutive year of expansion and growth. It is essential that the growth of the economy continue and increase in the future. The budget is designed to achieve that goal.

The budget has five broad themes:

- ***Investing in Our Future***—With an eye toward future growth, and expansion of the human frontier, the budget's chief emphasis is on investment in the future. It proposes: a capital gains incentive for long-term private investment and new incentives for family savings; record-high amounts for research and development, space, education, and Head Start; a major investment in civil aviation; and a large increase in spending to attack the scourge of drugs. At the same time, the budget maintains a strong national defense while reflecting the dramatic changes in the world political situation that are taking place; and it fulfills responsibilities to protect the environment, and preserve America's cultural heritage.
- ***Advancing States as Laboratories***—The budget recognizes the emergence of new ideas and initiatives originating at the State and local level. The Federal Government will foster such innovation and experimentation in numerous fields, from transportation to health, through waivers of certain rules and regulations, and through demonstration grants.
- ***Reforming Mandatory Programs***—Entitlement and other mandatory spending now constitutes nearly half the budget, not counting an additional 14 percent for interest. The budget provides for full payment of social security benefits and funds growth in health, low income and other mandatory programs. However, it proposes reforms where warranted to slow the growth in some of these programs and thus leave more room in the budget for priority initiatives.
- ***Acknowledging Inherited Claims***—The budget faces up to such inherited claims as the cleanup of decades old environmental damage at nuclear weapons facilities. It analyzes potential claims from unfunded annuities and Federal insurance programs. It assesses the growing volume of defaults in Federal credit programs and proposes essential credit reforms.
- ***Managing for Integrity and Efficiency***—The budget contains suggestions for reforms in the way Congress deals with the budget. It provides more resources and suggests improved methods for managing the vast Federal enterprise better. It identifies low-return domestic discretionary programs where a smaller investment of budgetary resources is warranted.

The budget meets the deficit target of $64 billion for 1991 established by the Gramm-Rudman-Hollings law, without raising taxes. It would balance the budget by 1993 as required by that law, begin reducing debt, and protect the integrity of Social Security.

Each of the themes outlined above is discussed in more detail in Section One of the budget, the Overview. The customary tabular and appendix material is contained in Section Two.

I look forward to working with the Congress in the weeks and months ahead to produce a budget that meets the Gramm-Rudman-Hollings target, advances the Nation's essential interests, and keeps the economy on the path of continued growth.

George Bush

January 29, 1990

IV. ADVANCING STATES AS LABORATORIES

"It is one of the happy incidents of the federal system that a single courageous state may, if its citizens choose, serve as a laboratory; and try novel social and economic experiments without risk to the rest of the country." Justice Louis D. Brandeis, dissenting in *New State Ice Co. v. Liebmann*, 1932.

More than many realize, State and local governments are today performing the laboratory function cited by Justice Brandeis in a wide variety of areas—from education to transportation, from child care to the environment. In many cases Federal funding is supporting demonstration projects; in other cases Washington is granting waivers from normal Federal rules to permit experimentation. But in numerous instances States and localities are moving on their own, with their own funds, to try new and innovative approaches to problem-solving.

This blossoming of State and local innovation is welcome. As the intractability of some problems, such as those associated with poverty, attests, national approaches tried over the past 30 years have had a mixed record of success at best. Despite a level of Federal taxation which, at about 19.5 percent of the gross national product, is higher now than has been the historic norm in the past 40 years, the Federal budget is under severe and well-recognized constraints. This is not to say that the fiscal condition of State and local governments is "easy", but their budgetary situation is not dominated by large and persistent deficits as has been the case with the Federal budget.

Much more than relative fiscal capacity is important in consideration of "States as laboratories." Until quite recently a case could be made in many areas of government policy and action that a national approach, with national rules and standards, was warranted. This was so because some States departed widely from national norms in such areas as racial segregation, and some were too poor to accomplish as much as may have been judged appropriate. A lot has changed in the past quarter century.

The "one man, one vote" decisions of the Supreme Court have greatly altered State legislatures, giving greater representation to urban areas. The civil rights revolution has been one of the seminal events of the twentieth century; to cite just one aspect of the revolution, elected black officials in the South are now commonplace. State government structures have been modernized. Income disparities among the States of earlier in this century have narrowed, and the sustained economic expansion has raised the income levels of all the States.

The U.S. Advisory Commission on Intergovernmental Relations, in a 1985 report entitled "The Question of State Government Capability", made an unequivocal judgment: "This study concludes that State governments have been transformed in almost every facet of their structure and operations."

Assessing the effects of the reductions in some Federal grant-in-aid programs in the early 1980's under President Reagan, Richard P. Nathan and Fred C. Doolittle stated: "There is evidence . . . that Reagan's federalism reforms have stimulated and are continuing to stimulate state governments to increase their efforts to meet domestic needs in the functional areas in which the national government either was cutting grants-in-aid or threatening to do so." In the case of "social programs" in particular, Nathan and Doolittle cited a trend toward some retrenchment in Washington and then, based on their reporting on developments in numerous State and local governments, concluded:

> "In conservative periods, the supporters of social programs are likely to find that in many instances their best strategy is a devolutionary one. They may well find in particular areas of domestic policy that the best approach is to seek support from those States and major local governments which for various reasons are sympathetic to proposals for increased social spending."

The prevailing philosophy varies by State, of course, which is the nature of a Federal system. However, by almost any measure the extremes among the States have narrowed. Those concerned about the segments of our population who have been left behind need no longer turn to Washington as the only source of redress.

The President's budget continues and expands the many-sided effort of the Federal Government to foster and finance experimentation in the States. In the areas of education and low-income programs in particular, to be described below, the President's program supports important innovations and experiments, including steps to reduce Federal controls and regulations in order to give State Governors and legislatures greater latitude to try new methods.

Apart from these efforts, the Administration's support of the principles of federalism is expressed in Executive Order 12612, issued in 1987 and personally endorsed by President Bush in a speech to the National Governors Association in 1989. This is designed to make sure that proposed policies and legislation conform with federalism principles, including maximum discretion to State and local governments.

An additional initiative is a test, run jointly by the Office of Management and Budget and the National Governors Association, of using a single Federal administrative grant for reimbursing State costs of administering Food Stamps, Aid to Families with Dependent Children, and Medicaid. The test will be carried out in five States beginning in April 1990.

The remainder of this section describes, in various areas of governmental concern, several of the many examples of innovation at the State and local level—some aided by Federal grants, some made possible by Federal statutory or administrative waivers and others entirely at local inititative. The picture is one of much more innovative activity than is often assumed in Washington. It is a picture of creative experimentation—not social engineering but the natural flowering of variety inherent in a healthy federal system.

It is a picture that merits highlighting—and Federal Government support.

TRANSPORTATION

Toll Roads.—While certainly not a new phenomenon in the United States, toll roads are now experiencing a resurgence in popularity. As roadbuilding becomes increasingly expensive and congestion worsens, toll roads offer a viable alternative to many States otherwise unable to afford highway projects. At present 26 States have toll road facilities covering almost 5000 miles, and more are contemplated. According to the International Bridge, Tunnel and Turnpike Association, 17 States are currently considering $8.6 billion worth of toll road proposals totaling 902 miles.

In an example of strictly privately financed, for-profit toll roads, Virginia's Commonwealth Transportation Board in 1989 approved the longest private toll road in the country, and the first such road in Virginia in 173 years. The road will be a 14 mile extension of the existing and successful Dulles Toll Road, which runs parallel to the toll-free access road to Dulles International Airport.

Where once toll roads were largely concentrated in the East, Sunbelt States, including Texas and California, are now beginning to experiment with the concept as well. For toll road users, transportation costs will be higher, but travel should be safer and quicker.

In general, the Federal aid highway law prohibits spending Federal funds for new toll roads. But as a demonstration, the 1987 reauthorization permitted Federal financing for up to 35 percent of the cost of seven non-interstate toll road projects, and two more were added in subsequent appropriation bills. These nine projects are now in various stages of approval. In the next reauthorization, due to be taken up in the 1991 session of Congress, the Administration will look favorably upon innovative means of financing highways, including toll roads.

Airport Financing.—The 1987 reauthorization of the Airport Grant Program included a 2-year pilot program allowing three States more administrative control over airport grants. Starting in 1990 Illinois, North Carolina and Missouri will assume sole responsibility for distributing airport development funds and master planning for all nonprimary airports in their States, on the assumption that they are closer than the Federal Government to airport problems and are the best judge of priorities. A report will be made to Congress on the results of this demonstration, with the possibility of expansion to the rest of the country.

States, and local airport authorities, are also looking at alternatives to Federal funding for airport construction and development projects. One prominent alternative is the imposition of a "passenger facility charge" or PFC. Although PFCs are levied in 138 foreign nations, in 1973 Congress prohibited their use in the United States. The Department of Transportation estimates that by imposing an average PFC of $3 per passenger, almost 60 major airports would collect more than twice what they would receive in Federal airport formula grants.

Airports favor PFCs for several reasons: no Federal appropriations uncertainties; an independent revenue stream controlled by the airports; and ability to finance additional airport capacity. The Administration proposal for reauthorizing the Airport Grant Program will include a provision abolishing the prohibition on local airport fees.

High Speed Rail.—States and localities have received $4 million from the Department of Transportation's Federal Railroad Administration (FRA) to perform feasibility studies of high-speed rail systems in their areas. In many cases, this "seed money" has resulted in the formation of special State/local commissions and authorities to select franchisees for the construction and operation of high-speed rail systems. While no State has yet awarded a franchise, several are well along in the process. The 1991 budget includes funding for research on magnetic levitation high-speed trains, or "maglev."

No Federal financing for construction or operations of the high-speed rail projects is being proposed or requested. Financing instead will come from innovative sources, such as the grant of real estate development rights along the proposed Miami-Orlando-Tampa high speed rail route in Florida. The Ohio High Speed Rail Authority has eminent domain powers and $2 billion in tax exempt bonding authority to build a rail line linking Cincinnati, Columbus and Cleveland. Among other projects under consideration are those that would link Las Vegas and Los Angeles; Dallas, Houston and San Antonio; and a 300 m.p.h., 20-mile maglev link between Orlando Airport and Disney World in Florida.

Mass Transit.—As the cost of subways mounts and voters reject transit bond issues, cities are turning again to buses and are innovating in several ways, ranging from use of private service to new fuels. Buses are not glamourous, but a bus that will last 12–15 years, carry 50 passengers, and provide a safe, flexible route costs about $200,000; this compares with a cost of $10 million to $300 million per mile to construct rail rapid transit. Studies suggest that while businesses and developers favor high-tech transit, the average taxpayer is unwilling and unable to foot the bill.

Of necessity, cities have returned to the drawing board to come up with new plans in which expensive rail systems play a lesser role and buses are more prominent. For example, Dallas has scaled down the rail part of its transportation package by about a third and balanced the package with a much improved bus system. It includes new busways for express bus service, inter-suburb bus hubs where routes converge on a central point, and house to house pick-up by mini-van. Another approach, used in the Northern Virginia suburbs of Washington, D.C. and elsewhere, is to encourage use of carpools, vanpools, and buses by reserving special traffic-free highway lanes for these vehicles.

Private bus service has been successful in a number of cities, sometimes for only a portion of the total transit network. Several localities have used the method of competitive contracting, with the public transit agency competing against private bidders. Studies by the Federal Urban Mass Transit Administration have indicated that private companies can deliver mass transit services 20 to 50 percent less expensively than public agencies, largely because of a difference in labor costs. As an example, Denver was mandated by the Colorado legislature in 1988 to convert 20 per cent of its lines to private service.

An alternative to commuting by personal automobiles has attractions for a variety of reasons, not least of which is reducing air pollution. Denver, Los Angeles, New York and Seattle are testing UMTA-funded demonstration buses that run on compressed natural gas or methanol.

Drunk Driving.—The budget proposes to double funding for the recently established Drunk Driving Prevention program to $8 million. This program provides grants to States that adopt specified measures to curb drunk driving, such as suspension of drivers licenses, and will test which enforcement measures are most successful.

EDUCATION

Awareness of the serious deficiencies of American public school education hit the Nation with the force of an explosion in the 1980s. Publication in 1983 of the report entitled "A Nation at Risk" gave impetus to movements for reform that were beginning to crop up in States and localities across the country. A high point of the reform effort was the Educational Summit meeting of President Bush and State Governors in Charlottesville, VA in September 1989.

The problem of poor educational performance is a troublesome one for the Federal government because elementary and secondary education are almost entirely the responsibility of State and local governments and school boards. Federal grants to help finance and improve elementary and secondary education, almost non-existent until the mid-1960s, have risen to $10 billion in 1990, but this is only about 7 percent of the national total. The bulk of the Federal funds goes to programs aimed at improving the education of children with disadvantages of various kinds. Beyond that, the Federal government can contribute best by fostering, and in some cases helping to finance, educational innovation in the States; helping to evaluate, through improved statistics and testing, the actual status of educational performance; and research and dissemination of information on the myriad of experiments that are going on at the State level, assessing what works and what does not. The 1991 budget, for example, contains $3 million to evaluate local initiatives and disseminate the results.

Finally, the Federal government can remove barriers to innovation and experimentation that arise from its own rules and regulations, many of them stemming from statutory requirements. As a follow-on to the Charlottesville Summit, the Administration will support legislation to grant more flexibility to the States in use of Federal funds, with safeguards to assure that services are provided to the targeted populations. The flexibility would be conditioned on establishment of objectively measurable goals for improved performance.

What follows is a listing of a few of the educational innovations and changes taking place at the State and local level. Also included is a sampling of demonstrations and experiments proposed to be financed by the Federal government in this budget.

Minnesota Choice Options.—The principal innovation, among several, permits students in grades kindergarten through 12 to apply to attend school in any school district in the State. Other new options include permitting 11th and 12th graders to attend a postsecondary institution full or part-time and obtain high school credit; establishment of Area Learning Centers to provide year-round, individualized education for students aged 12 to 21; and "Diploma Opportunities for Adults", an opportunity for people 21 and over to complete high school. The U.S. and Minnesota Departments of Education are conducting a joint 3-year study of the results of several of these innovations, including the Statewide choice-of-school option.

New Haven Model Schools.—Dr. James Comer of the Yale Child Study Center began in 1968 to try to transform two elementary schools in a low-income, predominantly minority neighborhood, principally through a comprehensive reform in the management of the schools. When the experiment began the two schools ranked 32nd and 33rd out of 33 New Haven schools in reading and math achievement and had the city's worst behavior and attendance problems. By the mid-1980s the schools ranked third and fifth in fourth-grade test scores, and one of the two led the city in school attendance for four years in one 5-year period.

Maryland Accreditation System.—In an innovation that is just beginning, all of the State's 1,200 public schools will by 1992 be evaluated and rated on performance by a State team of inspectors. There will be financial rewards for schools that are rated superior and penalties, including the possibility of takeover by the State, for low-performing schools. In addition, the State Board of Education has decided to change the State's testing system to measure better how students perform, and it has opened the way to teacher certification of college graduates without formal teacher training programs.

Washington "ECEAP"—Early Childhood Education and Assistance Program.—This is a variation on the federally financed Head Start program for disadvantaged children. It involves special academic requirements for teachers and school aides, and correspondingly higher salaries, and it also places special emphasis on involvement of parents. Among the earliest advocates, urging the State legislature to fund the program, was the Washington Roundtable, an organization of leading business executives concerned about the State's future work force.

Rhode Island "Crusade for Higher Education".—To help induce at-risk children to stay in school, the State will offer them tuition assistance at in-State colleges in return for a written commitment to obey the law, avoid early parenthood and refrain from drugs. The agreement is to be offered to third-graders and their parents. While all children are asked to join, the scholarship assistance will be available only to those in financial need. There are somewhat similar programs in New York, Louisiana and New Mexico.

Federally Financed Experiments.—While most innovation has sprung up spontaneously at the State and local level, the Administration is moving on several fronts to give a further boost to new means of tackling the education problem. The following are several of the grants proposed in the 1991 budget:

- *Alternative Certification for Teachers and Principals.*—The budget proposes $25 million for grants to States to design and carry out programs through which persons can become teachers and principals in ways other than the traditional certification routes.
- *Dropout Prevention.*—Special projects in local school systems to reduce dropout rates of secondary school students will be financed by grants totaling $45 million, supplemented by $5 million for related research.
- *Emergency Drug Grants.*—These grants go to local school districts with the worst drug problems to devise innovative approaches to reducing drug abuse. This is one aspect of the President's drug program, and will total a minimum of $25 million.
- *Training of School Principals.*—The budget proposes $25 million to support a new initiative to improve the training of principals-to-be. The program will include a short period of residential training and a year working with a successful "exemplar" principal to learn, first-hand, how to manage schools.

COMBATTING POVERTY

In no area of public policy is innovation and experimentation more widespread than in the often-frustrating effort to deal with the causes and effects of poverty. The Social Security Act of 1935 itself was the product of several decades of State innovation in development of "mothers' aid" for widows with children and programs for aid to the aged and blind. More recently, State successes with welfare-to-work demonstration programs were instrumental in the enactment in 1988 of the most important reform of Aid to Families with Dependent Children (AFDC) since its inception in 1935. State innovation is continuing to receive encouragement from the interagency Low Income Opportunity Board established in 1987 in the White House and reestablished by President Bush early in his Administration.

The Federal contribution to experimentation at the State level has been twofold—direct financing of some demonstrations and, probably more important, the grant of flexibility to the States under various statutes, including the Social Security Act, to permit them to try new approaches that would not be permitted under the basic laws. This flexibility is provided in the statutes themselves or through a process of waivers. The Low Income Opportunity Board screens and coordinates the grant of waivers by various agencies under different statutes.

During the first half of the 1980's a combination of Congressional willingness to allow States more flexibility, strong support by the Administration, and State efforts to find ways to help welfare families become independent laid the groundwork for the Family Support Act of 1988 (often called "welfare reform"). Both demonstrations and waivers were used to test new approaches. In either case, the essential ingredients were States with ideas about ways to do things better and determination to follow an experiment through to its conclusion. Not all of the welfare-to-work experiments produced encouraging results but enough did to persuade the Administration and Congress to change the underlying Federal law. As an example, States showed that welfare mothers, including those with preschool children, could be required to participate in work-related activities, with some success in later placement in gainful employment.

Currently the States are busy with the task of implementing the new law. However, experimentation and innovation have not stopped. With the support of the Low Income Opportunity Board, a number of States are continuing to test alternative ways of helping to move welfare families toward self-support.

What follows is a sampling of ideas and projects that are being tried across the country. It should be noted that some of these experiments are controversial, some may not work, others may prove to cost too much for the benefits produced. That is the nature of "States as laboratories". As any scientist knows, the road to success is marked by numerous laboratory failures. The sampling below is meant to illustrate the breadth of initiatives, not to endorse specific projects or approaches.

Wisconsin "Learnfare", Linking AFDC and School Attendance.—Under this controversial experiment, made possible by a Federal waiver, a welfare family with teenage children has its AFDC benefit reduced if the child drops out of school, defined as missing three days of school in a month without a valid excuse. Supporters see this requirement as a necessary step in breaking the cycle of welfare dependency by making certain that the children get an education. But there are many critics. Some welfare families reportedly have resorted to various fraudulent excuses for their children who are not in school, including forgery. However the experiment turns out, new knowledge of what works and what doesn't will have been acquired.

Minnesota "Family Investment Plan".—In December of 1989 the President signed bills providing special authority for a demonstration of the effects of intensive social and educational services and expanded cash and non-cash benefits for low-income families in several localities in Minnesota. Among other features, the "Family Investment Plan" will provide a consolidated cash grant combining AFDC and food stamps, and will extend medicaid and child care assistance to non-AFDC households eligible for food stamps.

New York "Child Assistance Program".—The State began a demonstration in 1988 aimed at replacing welfare payments with increased efforts by the parents to support their children. New emphasis upon obtaining child support from absent parents is combined with a supplemental benefit designed to increase incentives for the custodial parent to seek and hold a job. To enter the program a single parent must have obtained a court order for child support, a precondition which the State hopes will increase efforts by custodial parents to establish paternity and obtain support orders. The supplemental benefits are calculated according to a formula which, in comparison to AFDC, permits families to retain more of their benefit as their earnings increase. The demonstration, under way in several urban and rural sites, will last 3 years and includes a rigorous evaluation designed to ensure that the effects of the experiment will be known precisely.

Youth Opportunities Unlimited (YOU).—This proposed Labor Department program, to be tested in a maximum of 40 high-poverty inner city and rural areas, involves "challenge grants" to areas that offer a comprehensive package of services and a specific objective for low-income, at-risk youth, such as high school completion. Job training will be a major component but not the only one. The local grantee will have to enlist the support of the private sector, local government agencies and school boards. The Federal funds will total $50 million annually, and successful grantees can receive funds for up to 3 years.

Ohio "Project Learn".—In a program directed specifically at teenage parents, the State will offer a bonus under AFDC of $62 a month to young welfare mothers (and fathers if present) who remain in school or go back to school. That is the carrot. The stick is a corresponding reduction of the grant for teenage parents who refuse to stay in school.

New Jersey Unemployment Compensation.—This experiment does not involve poverty as such but, rather, the problem of unemployment of persons who normally work. The State identifed about 8,500 workers collecting unemployment compensation who had lost their jobs because of layoffs, plant closings and similar events and who were regarded as likely to have difficulties finding a new job. One group was offered intensive job search assistance alone; a second group received training or relocation assistance in addition to job search; and the third group was helped with job search and also received a cash bonus if they found full-time work within 12 weeks. None of these approaches "paid for themselves" in the sense of a net saving to the unemployment compensation system, but the first and third were found to have net benefits to society as a whole. The cash reemployment bonus idea is now being tested in Pennsylvania.

Through the Low Income Opportunity Board and other approaches, including proposed statutory changes as needed, the Administration will continue to work with the States in seeking new approaches to the problem of poverty. Whatever is done, it is already clear that experimentation at the local level is an indispensable element in finding out what works.

HEALTH

As is widely recognized, the health care system in the United States is flawed in two different and opposite respects: Its costs are higher than in other nations and are rising rapidly; and yet life expectancy, infant mortality, and other measures of health status are less favorable in the United States than in many other industrialized societies, and a sizeable minority of the population is not covered by public or private health insurance. No one actor in the health drama can create a solution, but as in other areas ideas are bubbling up from the States.

Medicaid in Oregon.—One of the most innovative health care proposals in any of the States comes from Oregon. The State proposes to expand greatly the coverage of the medicaid program (jointly financed by the Federal Government and the States) to cover the entire State population whose incomes are below the poverty line, but to limit the cost by assuring only a "basic" or "adequate" package of medical services, with additional services to be provided only if funds are available. Health care services would be ranked by a Health Services Commission to establish a set of priorities.

The sponsor of the bill, who is a medical doctor, has posed the issue in these terms: Given a limit on resources, the choice is between expanding the eligible population and placing some limit on the benefits, or holding the benefits constant and limiting the eligible population. He has chosen the former.

The Oregon plan will require a Federal waiver of the normal medicaid rules, either administrative or statutory. It is controversial. Among other things, questions arise whether it will be as cost-neutral as it purports to be. But it clearly breaks new ground in seeking to deal with a major problem. The Administration is studying the plan.

"OB Access" in California.—Infant mortality is higher in the United States than in most other industrialized countries. A problem primarily of low-income mothers and their babies, infant mortality, it has been found, requires for a solution more than just making available adequate nutrition or even offering prenatal care. Personal contact and other services are often required, to assure that the nutrition and care are sought and actually delivered to those who need it.

The California OB Access program (short for Access to Obstetrical Care) is based on this principle. It began in 13 counties with a high incidence of poverty and involves a comprehensive package of services. The pilot program revealed that the percentage of babies with low birthweight was 35 percent lower among OB Access participants than in the medicaid population that was not served. As a result of these findings the legislature enacted and the Governor signed legislation making the program Statewide starting in 1987.

Care of the Frail Elderly at Home.—In most cases elderly persons do not want to enter nursing homes, even if they can afford it. Their families, too, often prefer to have them at home rather than in a nursing home. But care of the frail elderly can be a time-consuming and exhausting task for the family member or members who undertake it.

In an effort to find a midway solution between full-fledged, expensive professional care in the home and no help at all for the family members, New Jersey, with help from a Federal demonstration grant, is experimenting with "respite care". It involves the use of professionals on a part-time basis whose purpose is not principally to serve the frail elderly person but rather to relieve the burdens of the family members who are providing care. It can include periodic home visits, taking the elderly person out of the home for a few hours and other services.

An important purpose of the experiment is to ascertain whether this part-time assistance can reduce or eliminate the need for long-term care in a nursing home. Even if the demonstration shows only that respite care reduces premature placement in nursing homes, it will have proved valuable.

Medical Malpractice Liability.—States are experimenting with new approaches to the problem of rising insurance costs for medical malpractice. More traditional efforts at tort reform, adopted in some degree by nearly all States in the past 15 years, have had only modest effects on the frequency and severity of claims, according to a study by the Institute of Medicine. The newer approaches are controversial, and they could prove costly to taxpayers. Under a 1989 law in Texas the State itself will provide coverage for doctors whose caseload includes at least 10 percent charity cases; such cases include those under medicaid and other programs providing health care to the poor. In West Virginia, a new law provides that the first $1 million of liability to a pregnant medicaid client is taken over by a State agency.

ENVIRONMENT

Although in some areas of governmental policy the consistency imposed by Federal laws or regulations is often desirable, complete uniformity is neither necessary nor desirable. In developing environmental programs, States and local governments frequently have designed regulations that are responsive to their communities' unique needs, and have experimented with creative ideas that may percolate into constructive new national policies.

Solid Waste.—Safe and efficient disposal of solid waste will be one of the great environmental challenges of the 1990s. The development of effective waste management techniques is a task primarily of State and local governments. To deal best with the growing mountain of waste, communities usually require integrated plans involving source reduction, source separation, recycling, incineration and landfills. In the past year, 134 new recycling laws have been passed by 38 States.

Acting on the principle that reduction of the waste stream is the preferred approach, the coalition of Northeast Governors has formed a "packaging task force" to encourage manufacturers to develop new packaging designs that reduce the waste generated by their products.

Numerous States and localities have initiated "curbside separation" programs that facilitate recycling, clean and efficient combustion, and the safe use of landfills. But separation is not a panacea. New Jersey has implemented a successful program that requires separation only of materials such as aluminum and paper, where markets exist for the recycled waste.

By contrast, the recent growth of newspaper recycling has created gluts in the newsprint supply that greatly exceed demand and discourage the entry of new entrants into the recycling markets. To help alleviate this problem, Florida now imposes a 10 percent tax on virgin newsprint and provides tax credits for the use of recycled newsprint. California and Connecticut require newspapers to use minimum percentages of recycled newsprint. These efforts, backed by the support of the American Newspaper Publishers Association, have helped spur the growth of markets that is essential to the continued success of newspaper recycling.

Modern incineration facilities can be cleaner and safer than landfills, and are an important alternative to them. There are now more than

100 municipal incinerators in operation, two-thirds of which recover energy for local use, and another 200 incinerators are planned. Baltimore, for example, burns 2,250 pounds per day, recovering 55 megawatts of electricity that is sold to the local utility. New scrubbing and high temperature combustion technologies permit safe emissions levels in compliance with clean air requirements.

Even smaller communities have found that they can economically promote sound environmental policy by developing comprehensive solid waste plans. Winona, MN, a community of 45,000, has had an integrated solid waste plan since 1981. The county program includes public education; mandatory curbside separation of six types of waste; recycling of tires and appliances; composting; and incineration. There are plans to build a modular incineration plant and to recycle the waste ash. Within 5 years less than 10 percent of the community waste stream will go to landfills, and over 40 percent will be recycled.

Non-point Source Water Programs and Wetlands Protection.—States and regions have widely divergent causes of non-point source water pollution and they have taken different approaches to address the problem.

For example, the States that make up the Chesapeake Bay watershed have joined forces to reduce pollutants by 40 percent in order to protect water quality and preserve the rich living resources of the Bay. Maryland, Delaware, and Virginia have successfully tightened pollution controls for cities and for farmland runoff, strengthened wetland protection, and instituted tighter land use control. The result has been a cleaner bay and a resurgence of aquatic life.

Iowa, a leading agricultural State, has taken an aggressive approach to its groundwater pollution problems that aims at controlling pesticide and fertilizer contamination. The State has increased pesticide and fertilizer fees and devoted those resources to research on farming with reduced use of chemicals.

Washington has dedicated taxes on tobacco products and pollution control equipment to finance water pollution control, wastewater management, and groundwater runoff projects in an effort to maintain the quality of the Puget Sound.

Hazardous Waste Cleanup.—While Superfund, the Resource Conservation and Recovery Act (RCRA), and other Federal programs have made progress in preventing and cleaning up toxic wastes, some States have added innovative cleanup efforts of their own. New Jersey, for example, has induced polluters to clean up sites by requiring environmental audits before real estate can be sold.

RCRA requires the cleanup of leaking underground storage tanks, and 33 States have passed laws to supplement the Federal law. Ohio, Maine, Pennsylvania, Vermont, and New Jersey have established insurance funds or loan pools to assist tank owners with the cleanup. Ohio has almost 80,000 tanks, and many owners would presumably have delayed or avoided the costly cleanup without the State's assistance and encouragement.

CHILD CARE

Nearly every State has addressed the child care needs of working families by one means or another. For example, 28 States and the District of Columbia subsidize parents' child care expenses by providing deductions or credits on State income taxes. Thirteen States now give tax breaks to employers who provide specified child care benefits for their employees, such as information services, assistance with child care costs, or on-site child care centers. Twenty-six States and the District of Columbia finance early childhood education programs, and 11 of these States have lengthened the hours of their pre-school programs. States, and local school districts, have established a variety of before- and after-school programs for children of school age. Finally, almost all of the States use a portion of their Federal social services block grant (Title XX) for child care and related activities.

Examples of child care developments in several States and localties follow.

Ohio.—The legislature in 1989 voted to more than double child care spending. This funding is targeted mainly at low-income parents, including teenagers who need child care assistance to complete school.

New York.—The State has the Nation's largest network of model employer child care centers, operated by State agencies and State universities.

Minnesota.—An increase of $18.5 million for the 1990–91 biennium will go for such purposes as subsidies for low-income working families to help them pay for child care, child care subsidies for low-income college students, and training for child care providers.

California.—This State has the Nation's most extensive "resource and referral" network—local service agencies that help parents locate child care. There are 65 agencies in all, at least one in each of the State's 58 counties.

Indiana.—The State cigarette tax was increased half a cent per pack, with the additional revenue designated for school-age child care. Additionally, the Indianapolis Department of Public Safety, whose concern is crime, conducts special seminars for "latchkey" children—those who are at home by themselves after school. A Latchkey Task Force teaches children first aid, what to do in case of fire or weather emergency, and even how to prepare nutritious snacks.

Florida.—The legislature last year doubled appropriations for pre-kindergarten programs and funded 6,000 additional child care slots for children of low-income working families. The package included other elements such as training of child care workers.

Wisconsin.—In 1989 the legislature added a credit to the State income tax that benefits all low-income working families with children, whether or not they have documented child care expenses. The credit increases with family size and is refundable, so that it is available to families who do not pay income tax.

CONCLUSION

Across the broad range of domestic policy, the Administration will:

- continue to encourage the "States as laboratories;"
- work with Governors, mayors, county officials, and their various associations to foster innovation and identify obstacles to it;
- ensure sound evaluation of experiments and publicize lessons learned; and
- together with State and local governments, facilitate the more general application of the "state of the art" where innovation has shown the way to better results.

The New Paradigm—Remarks by James P. Pinkerton, Deputy Assistant to the President for Policy Planning to the World Future Society

Thank you Lindsey. Good morning.

I'm here today to talk about George Bush, the first President to govern in the spirit of the New Paradigm, a concept I'll return to in a moment. But before I talk about the New Paradigm, we need to dispose of the superficial Beltway theories about the Bush Presidency. Some say that the President's success comes from atmospherics, such as his personality, or Mrs. Bush, or the puppies. I say that's wrong. The voters may be charmed, but they look to the bottom line: peace and prosperity; what works for them. President Bush is popular because his policies are working. And the reason things are going well for the Administration and the country is that George Bush is truly in tune with the global Zeitgeist of freedom, decentralization, and a new look at ways to solve old problems.

In the face of the conventional wisdom, the President has kept his campaign promises: a Kinder, Gentler Nation, and No New Taxes. Add the unprecedented prospect of reduced troop levels in Europe and decreased military spending around the world and you have a President and a country perfectly positioned to benefit from the dawning of the New Paradigm around the world; the new forces that define how the world works, cracked the Berlin Wall, dismantled the Soviet Empire, and brought a new peaceful integration of the world economy, with the prospect of a better life for everyone.

These forces go by different names. The President himself has spoken of the New Breeze of peace and freedom that is sweeping the globe. The New Breeze is a metaphor for the learning process that has led virtually all of us to conclude, as the President has said, "We know what works. Freedom works."

Just as we now know what works, we have all come to know what doesn't work. After decades of collectivization and concentration camps, we have learned the truth about an ideology whose central premise is a war against human nature, including the human desire for voluntary exchange. Socialism doesn't work. It has obviously failed in Eastern Europe, but it has also failed when it goes by some other name. State socialism doesn't work in South Africa, where it goes by the name of apartheid, and it hasn't worked in the Third World.

Forgive me for laboring the cliche of the failure of socialism, but it's important to establish the context of the international failure of collectivism before I bring my argument home, to make the point that the same dream of centralized socialized bureaucracies has failed here at home in its lesser manifestations. Here at home, as in the Third World, the biggest losers under the old system have been poor people. The Great Society, to pick one obvious example, ahs been a continuing, if well-intentioned failure because it too was based on the false assumption that experts, wise bureaucrats in league with university professors and politicians, could somehow administer prosperity and equality from an office building somewhere.

Having said all that, am I about to launch into a critique of all social programs, and argue that we should do nothing to solve the problems that need solving? No. I'm here as a representative of the Bush White House and as a Republican to tell you that we have just as much desire to end homelessness, improve education, lift up the underclass and realize the goals of most liberals. However, as someone with some modest responsibility for governing, and with the benefit of what we have learned about what works and what doesn't work, I am also here to tell you that if we want to improve the lives of people, then we are going to have to go about solving them in a different way. In a phrase, we are going to have to be guided by the lessons of the New Paradigm.

In addition to this general awareness that freedom works and socialism doesn't, out of the 80s come two areas of emerging national consensus.

First, the public by and large agrees on the goals they want this country to achieve; whether Democrat or Republican, black or white, male or female, virtually everyone wants an educated young generation, a roof over every head, and a clean environment. It's a cliche that Ronald Reagan, the most conservative President in our lifetime, nevertheless ratified the welfare state, uniting both parties in a common commitment to the safety net. So now the argument shifts away from goals—which we all agree upon—to means. That is, how do we do what we all agree needs to be done?

Second, there are limits to the size of government. Like it or not, "read my lips" is national policy and will be, as long as people think that government, especially the federal government, is incompetent.

Some think that these two consensuses that define the 90s are in conflict, that we are condemned to wander around on a darkling plain, existentially stumbling over the rubble of demolished policy, poking around for new solutions to old problems. The New Paradigm is an attempt to light a candle of hope and optimism amid the cynicism, fatalism, and opportunism that have come to characterize Washington. I believe that people of good will can seize this opportunity to significantly restructure the way government operates, to move away from monopolistic bureaucracies, and thus meet change in a way that contributes to decency and competitiveness in the 1990s.

These two new consensuses, and the worldwide realization both that freedom works and socialism doesn't, spells the death of the Old Paradigm of centralized bureaucracy, where wise government officials preside over distribution and production, fine-tuning aggregate demand, etc.

The use of the phrase New Paradigm is one I have adapted from Thomas S. Kuhn's classic work "The Structure of Scientific Revolutions" as a way of getting a handle on the nature of the social transformation that is taking place around us. Indulge me a moment to review Kuhn's argument.

Kuhn argues that most scientists are problem solvers, proceeding in their activity on the basis of certain models or sets of assumptions about how the universe works. Kuhn calls those assumptions "paradigms." A great scientist will develop a paradigm to describe, for example, the nature of the solar system.

In the third century A.D., the astronomer Ptolemy outlined the theory, or paradigm, that the sun revolved around the earth. This "geocentric" paradigm was accepted by the ancient scientific community because it "worked," in the sense that ordinary scientists were able to use Ptolemny's paradigm to make at least some correct calculations about the location of the planets and so on.

Thus, until the 16th century, scientists labored under this paradigm, doing their best to solve scientific problems. Even though the Ptolemaic paradigm was clearly flawed, it was the best model they had. It did work, at least somewhat, to solve the problem of predicting the location of the planets.

More than a thousand years after Ptolemy, Copernicus and Galileo revolutionized astronomy by propounding a completely different paradigm: that the earth revolves around the sun. Suddently it became possible for ordinary scientists to advance the science of astronomy, because the assumptions they were now working on were so much closer to the truth. This heliocentric paradigm guides astronomy to this day. We all remember from school that the New Paradigm was not received with open arms by the Old Paradigm powers that were. Then the opposition was called the Inquisition. Today it's called * * *.

Kuhn put his finger on a truth about the scientific process that applies to societies as well as scientists. Societies, too, form themselves on the basis of paradigms. These paradigms may be good or evil; they may or may not "work."

If a paradigm does "work" it will continue to survive. But it still faces the challenge of adapting to challenges over time. Paradigms give way when people see a new, a different, a better approach. This process can happen by revolution, or by evolution.

Thus, feudalism was a social paradigm, which "worked" in the same limited sense that the Ptolemaic astronomical paradigm "worked" during roughly the same period. For all their obvious shortcomings, the two paradigms were all that these cultures had to make sense of the world. Of course, both paradigms were swept aside when other ideas—new and more useful paradigms—emerged. From our contemporary vantage point, we believe that these paradigmatic shifts were changes for the better.

Kuhn's lesson is that people will not abandon a familiar paradigm, no matter how defective it is, until they can grasp a new paradigm that will replace the old. This is the essence of the psychological and political truism that "you can't beat something with nothing." This is the transition period we are going through—people around the world are coming to see that the Old Paradigm is failing. Leaders and thinkers have a duty to help learn and share the emerging lessons of the New Paradigm.

I believe that centralized bureaucratic government is a manifestation of the Old Paradigm. Max Weber said in the last century that the alternative to bureaucracy was despotism, but he was describing a different world, where the main obstacle to progress was the dead hand of the aristocracy. For its time, bureaucracy may well have been the best available way to organize the transition from a farm to an industrial economy. Today, in the era of the Third Wave, Weber would agree that we have nothing to fear from residual aristocrats like Prince Charles and Fergie, and that today, Central Europeans and others see that the main obstacle to progress is reactionary statism.

The great English Prime Minister Disraeli said that a successful politician must know two things: he must know himself—forgive the nineteenth century sexism—and he must know his times.

The most important knowledge comes from confronting past mistakes: we must come to see our own institutional rigidities, in a way analogous to the way the Eastern Europeans have come to see theirs. The Eastern Europeans are worried about getting through the winter—we have to worry about the Japanese. But in both cases, thoughtful people see the need for change. The President's willingness to at least begin that process of reform is a key reason for his popularity.

The New Paradigm has five main features:

First, governments are now subject to market forces in a way they haven't been before. The policy-maker who tinkers with the economy in the wrong way, who pushes the wrong button, will see the flow of capital and investment re-route itself instantaneously across nations and continents and oceans.

This aspect of the New Paradigm is a function of feedback and the increasing sensitivity of the economy and political system to feedback. Where the system is increasingly self-monitoring and self-correcting there is less room for the social and economic experiments that were the hallmarks of the 60s and 70s. As someone said, if you don't deal with reality, other people will! The President's dogged determination to see a cut in the tax rate on capital gains, for example, seems very compelling in view of the low capital gains taxes imposed by America's greatest economic competitors (most have no capital gains tax at all).

Second, the New Paradigm is characterized by increasing individual choice. The President's education program offers a concrete example. Instead of pouring money into an existing structure—an education structure that already represents the world's highest expenditure per capita, yet the results of that spending have been disappointing, to put it mildly—the President offers a reform that promises to change that structure by letting parents choose the public school their children will attend.

Parental choice in education is a means of letting the people with a stake in the process, the parents, not bureaucrats, decide what constitutes a successful school. Outputs, not inputs. And the New Paradigm method of choice in education is sweeping the country, among state governments run by Democrats and Republicans alike. I might add that the trailblazer in the fight for choice in the public schools has been a liberal Democrat, Governor Rudy Perpich of Minnesota.

Third, the New Paradigm is characterized by public policies which seek to empower people so that they are able to make choices for themselves. Take the Bush Administration's approach to child care: The President has offered a Child Care Tax Credit for low-income working parents that enables—empowers—those parents to care for their children in the way that best suits them: at home, or with a relative, or a neighbor, or at a church- or synagogue-based child care program, or at a day care center.

By contrast, the old paradigm method is to focus on one method of child care, usually day care centers, to fund or regulate that one alternative to the exclusion of other alternatives, have the money trickled down from Washington, and thereby constrict the range of choice. Again, the quantitative approach is to say, in effect, how much spending can we "input" into one method in the hope that the method is correct.

The New Paradigm approach, on the other hand, says: how can we let those with a stake in a certain process, be it the process of caring for kids, or education or health care, whatever—how can we empower those with a stake in the process so that they and not bureaucrats can determine the outcome of that process. In a world where more and more people know better than to believe that wise bureaucrats can benevolently enact child care from Moscow or Washington, choice is increasingly the answer.

Fourth, the New Paradigm is characterized by decentralization: the dispersal of the centers of authority and the break-up of bureaucracy—whether those bureaucracies be a Stalinist government in Eastern Europe, a stodgy corporation on Park Avenue, or a sclerotic city hall in Anytown, U.S.A.

Decentralization means pushing decision-making downward and outward, to the lowest feasible level. No place, no culture is immune from the benefits of perestroika. The cultural anthropologists who said that one culture is backward as compared to another have missed the central insight of the great Peruvian economist Hernando de Soto: that people everywhere by and large want the same things. The President himself made this point in speaking of de Soto. Quote:

"By walking the streets of Lima, not analyzing official statistics, [de Soto] found that the poor of Latin America—who have never read Jefferson or Adam Smith—

ran their affairs democratically, outside the formal economy, organizing their private, parallel economy in a free and unregulated manner. * * * People everywhere want the same things. And when left alone by government, people everywhere organize their lives in remarkably similar ways."

End of quote. Those of you familiar with the great Nobel economist Friedrich Hayek will be reminded of the "spontaneous order" of the market that he described.

But what about here? What about decentralization here at home? Here too, centralized bureaucracies have proven themselves unable to translate our wealth and compassion into opportunity and a better life for every American. Public and private bureaucracies have not been able to adjust to the change of this decade, not to mention the coming decade. Therefore, a new generation which still believes in social justice and the promise of the American Dream must look for new ideas and new approaches to achieve the old goals.

Now that the people have learned that government doesn't know best, they will refuse to turn over decision-making power when they can decide better for themselves. Popular opinion now converges around the notion that instead of doing many things badly, the government should try to do a few things well. The public debate focuses on qualitative, as opposed to quantitative, changes in government, to a restructuring that finally begins to put the government in tune with the society that has changed so much in the past decades.

As Bob Samuelson recently put it, the American people are not so much stingy as they are skeptical. This skepticism—this immunization against being fooled by the authorities that the Information Age allows is a healthy thing. The guiding principle is accountability and feedback. Rather than a rigid dedication to centralized government, the New Paradigm emphasizes results. Achieving those results will usually require the above-mentioned market orientation, choice, empowerment, and decentralization.

Fifth, the New Paradigm implies an emphasis on what works: Once we agree on the goals of a decent life for every American, then the debate shifts to actually achieving those goals, as opposed to talking about them and spending money. As far as public policy is concerned, that means changing the way we measure the success of those policies. Again, its the difference between measuring input and measuring output.

Look at the President's education policy. The President, in an agreement with the governors at the Education Summit in Charlottesville last September, set out some national education goals based not on how much money we are going to pour into education, but just how well the students who come out of that education system perform—outputs, not inputs. One of the leaders in this effort, has been Governor Clinton of Arkansas, who has emerged, especially since Governor Kean's retirement as the most imaginative and energetic force for educational reform in the country.

Overnight, the debate on education in this country has changed. It is now a question of the quality of education, and less a question of the quantity of dollars that may or may not contribute to quality. Note that I am not saying that quantity is irrelevant, only that we have lost sight of why we focused on quantity and inputs in the first place. These factors may help determine the outcome, but they are not the same thing as the outcome.

I would refer all of you to David Osborne, whose Laboratories of Democracy is a wonderful overview of the individual states' respective efforts to actually make life better for their people. I don't agree with everything David says, but that's not the point. The New Paradigm does not rely on the wisdom of one individual, it relies on diversity and innovation spread out across the states like 50, or 1,000, points of light.

As I said, this President holds office at a time when there is an emerging national consensus: Everyone wants an educated young generation, a roof over every head, and a clean environment in which to live. And yet, everyone wants limits on the size of government—limits especially on the size of their taxes.

Are these two areas of consensus in conflict? Well, if you believe, for example, that the problems of America's schools can be solved by spending more money on them—if you believe that the best solution for the high cost of raising kids is to concentrate on subsidizing bureaucratized, monopolized day care—if you believe that the answer to housing our poor is only to build more public housing projects—then you must believe that, yes, our national aspirations are in conflict.

On the other hand, if you believe that we ought to judge our schools by how well they perform, not by how much money we spend on them—if you believe that those schools will improve if parents have a greater say in choosing the schools their children will attend—if you believe that the best child care is the one that responsible parents decide is best for themselves—if you believe in giving the poor a stake in their own futures, say through tenant management and ownership of public housing—if you believe, for that matter, that we should measure the success of our welfare programs by how many needy people pull themselves out of poverty—then, perhaps, you too see the outlines of the New Paradigm as it emerges from the dawn. A world where the focus of public policy is on what works, where we judge the success of those policies qualitatively not quantitatively—emphasizing outputs over inputs, where we expand individual choice, empower the poor, and create decentralized, flexible and adaptable institutions and organizations, there is a world where there is no insurmountable conflict between our national aspirations of caring for our neighbors and enlarging the sphere of our freedoms by limiting our government.

But note: none of this is just my opinion of what should happen in the future. All of this is happening. Thanks to the Information Age, thanks to the worldwide span of the media, thanks to the global village, we are learning faster about what works and what doesn't work. That, incidentally, is why I have been so impressed with the World Future Society. You are looking forward, scanning the horizons of what works. I like to think that the President shares that farsightedness. He is a man whose biography, after all, is entitled "Looking Forward."

But notwithstanding that similarity with the country's leading politician, this Society has of course not tied itself to the political, but to the practical. If, as I believe, we are witnessing the emergency of a New Paradigm, a new era marked by an emphasis on what works, then all the more worthwhile are the contributions of a practical, non-ideological organization like this Society—not least because the old cliches have suddenly taken on a new profundity: the future is today, as it never was before. So, as a fellow admirer of what works, let me say that I am particularly grateful to be asked here today. Thank you very much.

The CHAIRMAN. Our next witness is Major General Patrick J. Kelly, the Director of Civil Works, United State Army Corps of Engineers. The corps has always been an integral part of our Nation's infrastructure framework. They have been involved in the construction of large, multiple purpose dams, harbors, waterways, and flood control projects, and they are responsible for maintaining 25,000 miles of navigational channels and the operation of 232 navigational locks.

The corps also provided the staff for the National Council on Public Works Improvement, and more so, in a continued commitment to our Nation's infrastructure, General Kelly has established a Corps Infrastructure Task Force which calls for building partnerships between the corps and other agencies of government. We commend the corps for its leadership and for its efforts on behalf of our Nation's infrastructure.

General Kelly, welcome, and you may begin.

TESTIMONY OF MAJ. GEN. PATRICK J. KELLY, DIRECTOR OF CIVIL WORKS, U.S. ARMY CORPS OF ENGINEERS, ACCOMPANIED BY KYLE SCHILLING, ACTING DIRECTOR OF THE INSTITUTE FOR WATER RESOURCES

General KELLY. Thank you, Mr. Chairman.

After following two absolutely fantastic keynote addresses by Congressmen Gephardt and Gingrich, I will try to do my very best. Assisting me and on my right is Mr. Kyle Schilling, the Acting Director of our Institute for Water Resources, a super organization that does a lot of our studies and thinking.

Also, with your permission, Mr. Chairman, I have a longer version of my statement that I would like to provide for the record, and I will just summarize it here.

The CHAIRMAN. No objection, so ordered.

General KELLY. We certainly appreciate the opportunity today to discuss the Nation's infrastructure. The Assistant Secretary of the

Army for Civil Works, Bob Page, is extremely interested in addressing infrastructure challenges of the Nation. Both of us are looking forward to working with all the committees of Congress as we go about tackling this challenge.

I am here to testify because the Corps of Engineers is actively involved, as you previously stated, in a vital part of our public works infrastructure through our Civil Works program. That is the Nation's Water Resources Program. I might also point out that through our military program we provide infrastructure support to the Army and the Air Force worldwide at their bases.

We have been working on the Nation's waterways since the 1824 Rivers and Harbors Act when Congress first appropriated funds for us to assist in the navigation of our Inland Waterways System. Waterways and ports were vital then, and they certainly are vital today.

Another Congressional initiative in 1824, the General Survey Act, sent our military engineers into new territories to form a national integrated network of canals, roads, and later on, railroads. Throughout the years, our lawmakers have been steadfast with their support to the Nation's infrastructure.

Physical fitness is a daily pursuit for millions of Americans, but we have largely overlooked the condition of America's physique, its roads, bridges, water, sewerage systems, public transport, canals, dams, harbors, and other public facilities. They are getting out of shape. Although we are holding our own, it is time now for us to take a good long look at America's foundation to see if it is falling apart or if it will hold up for future generations.

America's foundation is not now in ruins, but more and more studies indicate that it is certainly inadequate to meet future economic growth and development needs. The four studies that I am going to quickly summarize today all point to a definite need for some repair work.

We all know what needs to be done. The $64,000 dollar questions are: Who is going to pay? Who is going to do the work?

For our purposes, I am going to define infrastructure as facilities that are generally characterized by public ownership, have a high fixed cost, and have strong links to economic development and competitiveness. That definition, Mr. Chairman further amplifies the discussion that you had with Congressman Gephardt on economic development and competitiveness. As requested, I now will present a summary of four studies which most comprehensively address the status of the Nation's infrastructure. Those studies are: the Associated General Contractors' report, "America's Infrastructure—A Plan to Rebuild," which was published in the Spring of 1983; Congress' Joint Economic Committee report called "Hard Choices," which was published in February of 1984; the Congressional Budget Office report, "Public Works Infrastructure: Policy Considerations for the 1980s," which was published in April of 1983; and the most recent one, the report of the National Council on Public Works Improvement entitled "Fragile Foundations," which just came out a little over two years ago in February of 1988.

All four of these studies indicate that we have significant infrastructure challenges. Two of the studies, that is the AGC's and the Joint Economic Council's, essentially look at needs which when adjusted for similar infrastructure categories are on the order of somewhere near $1 trillion. Both studies tend to highlight structural improvements rather than lower cost operational alternatives.

The AGC's report recommends that Federal, state, and local governments give infrastructure top priority funding. According to the AGC, the crisis at hand is urgent and rebuilding is vital to economic revival, growth, and employment. They recommend increasing investment, setting up State infrastructure banks, and whenever and wherever it is possible, charging user fees for services.

The other needs study, done for the Joint Economic Committee of Congress, looks at three areas: surface transportation, water, and waste water systems. According to the Joint Economic Council, we have a nationwide problem, but the single most dominant need across the country is for highways and bridges. Again, this study points to new financing mechanisms for relief and urges that a coordinated national assessment program get underway.

Both studies agree that a large dollar investment is necessary. Neither study gets specific about setting spending priorities, and both of them focus exclusively on structural improvement, perhaps ignoring other lower cost alternatives. I believe that these reports, finished in 1983 and 1984, are good documents to draw attention to the magnitude of the problem.

In contrast to the two reports that I have just discussed, more recent reports recognize the reality of budget constraints at all levels of government and the need for efficient investment in the decision-making process. The Congressional Budget Office report, entitled "Public Works Infrastructure: Policy Considerations for the 1980s," and the National Council Study, entitled "Fragile Foundations," focus on what we have now and how well it is functioning.

These two studies also offer some suggestions of where to invest and how to come up with the additional dollars needed. Their policy considerations include: Adjusting federal user fees to correct any incentives for overuse or under use, limiting the federal role to public systems of national importance only, and redirecting federal assistance to alter its current bias toward capital investment. The Council's report found that our public works systems are barely adequate, even for today's needs. Furthermore, by the turn of the century, they will be worse, and according to the Council, unless we change course, our public works will be inadequate to meet the demands of future economic growth.

The Council put together eight public works categories which were graded on a performance scale from "A" to "F". Overall, the Nation earned a "C-minus" for public works. This is an interesting report card. It is telling us that we have not spent enough and we are not getting the best return for those dollars that we have spent.

According to the report, the relative share of public works spending at all levels of government has declined drastically from nearly 20 percent of total expenditures in 1950 to less than 7 percent in 1984. The Council recommends a national commitment from the Federal, state, local, and private sector, to double infrastructure investment. In 1985, this was roughly $45 billion, so by doubling that, we are talking about a range of $90–$100 billion per year by the beginning of the next century.

In addition, the pattern of spending has also changed. Capital outlays have decreased, but operation and maintenance spending has increased, particularly at the State and local levels.

The Council further recommends defining roles for Federal, state, and local governments, drawing on the federal trust funds, a subject which was of considerable interest by both of the previous speakers, beneficiaries paying a greater share of public works costs, incentives for maintaining the infrastructure, and additional support for research and development to speed up innovation, a subject which was covered in some detail by Congressman Gingrich.

Even though there are disagreements over what should be done, when, and by whom, all studies agree that providing public goods is a legitimate function of government. They also agree that infrastructure investments have made a positive contribution to our economic well-being. It is when we move from readily accepted general observations to specifics that opinions about financing begin to diverge, and economists are right in the middle of the fray.

Infrastructure and the level and direction of public investment continue to generate new ideas and arguments. For instance, David Aschauer, from the Federal Reserve Bank of Chicago found a strong link between public investment and productivity. Some of our major trading partners such as Japan, which have high rates of public works investment, have also achieved higher productivity.

Aschauer concludes then that public investment stimulates private investment and increases competitiveness. A decline in public investment causes businesses to absorb higher costs with lower productivity and competitiveness.

Now we have another perspective, which is offered by David Montgomery, who is a Senior Economist with the Congressional Budget Office. He offers the bottom up approach. That is: individual projects should be evaluated separately so that the total spending equals the sum of each. He strongly urges a benefit/cost analysis approach and is a proponent of looking at alternatives such as maintenance spending rather than only looking at new construction. This approach bypasses the debate about how much aggregate public spending is enough. Montgomery wants to see more use of beneficiary pay and cautions that public investment must not substitute for private investment.

Mr. Chairman, I would like to point out that our Congress is also active in infrastructure issues and there are a number of bills introduced in the 101st Congress both on the House side and in the Senate. Activity is also picking up all over the country. Groups like the National Governors Association, the American Society of Civil Engineers, the American Public Works Association, the U.S. Conference of Mayors, and the Rebuild America Coalition, from which you are going to have a speaker very shortly, are all committed to the infrastructure challenges. Virtually all of the studies that I have summarized indicate these challenges.

Based on review of the studies and proposals which I have summarized today, it appears that a sizable gap exists between infrastructure investment and dedicated resources. Implicit to moving forward is the value we have placed on infrastructure and what we are willing to pay for those values.

Large questions loom on the horizon. Will our infrastructure support the activities we need? Can we continue to grow and expand? Will we be able to remain competitive in an expanding world economy?

The Office of Technology Assessment released its first study this past week and its conclusions follow pretty much what the other studies have said. That is: we will have to come up with the money or we will have to eliminate or reduce programs and services.

All of the studies show that we need to focus on the role our infrastructure plays in economic competitiveness, the appropriate balance between private and public investment, and the criteria we use for spending and charging user fees. Furthermore, we need to do work on infrastructure research and development. This will drive all sectors of government and the private sector to search for more innovative and cost-saving solutions to many of our infrastructure problems.

Mr. Chairman, that concludes my statement. I will be happy to answer any questions that you or the committee members may have.

The CHAIRMAN. Thank you, General.

First, I would like to thank the corps for all the work that you have done in reviewing the four major studies. In your statement, you list eight areas that would require future interagency efforts. How would you prioritize these and what, if any, recommendations do you have toward attaining these goals?

General KELLY. Sir, I would not prioritize them. They are all important in their own area and they range, as you saw, all the way from highways and bridges to water resources and from hazardous toxic waste to solid waste.

What we need to do is, the Department of the Army needs to work in partnership with the other Federal agencies that are involved in infrastructure and, most importantly, to work with the State and local governments as we begin to address this problem and to put together the vision and the strategy that was mentioned by Congressman Gingrich in his statement earlier.

The CHAIRMAN. I was kind of hoping that you would prioritize them by reminding me about the helicopter trip I took you on down the coast of California, showing you ports and everything else.

General KELLY. Those are all in mind, Mr. Chairman.

The CHAIRMAN. Okay.

Mr. Stangeland?

Mr. STANGELAND. There can only be one "Glenn Anderson Channel," however. [Laughter.]

Mr. STANGELAND. General Kelly, I have a number of questions.

Mr. Chairman, I may ask that some of them be submitted for the record after my colleagues have completed their questioning.

General, I guess one major question would be: What other Federal agencies will participate with the Corps in the infrastructure initiative that is budgeted for fiscal year 1991, and is their participation funded through their own budgets, will they be reimbursed from Corps funding, or will they be expected to absorb those expenses through existing programs?

General **Kelly**. Mr. Stangeland, it will probably be a combination. The Federal agencies that we are trying to pull together for an infrastructure advisory board to address a national strategy include: the Army, Energy, Transportation, Agriculture, Housing and Urban Development, Veterans Affairs, Commerce, Interior, EPA, and the General Services Administration.

We are asking for about $3.35 million for a three-year program, of which the first year budget request for 1991 is $350,000. That is basically to put together the administration that will deal with the Task Force, and a portion of the funds will be used to do some initial studies to assist the advisory group as they address those problems. Most of the other agencies are going to have to take some of their own internal funds and personnel to assist.

Mr. **Stangeland**. Thank you. Could you explain for us the operations of the Inland Waterways Trust Fund? We have argued long and hard for the need to spend down the surpluses in Aviation and the Highway Trust Fund. Is there any parallel in the Corps' experience with the Inland Waterways Trust Fund?

General **Kelly**. I might point out that I think the Inland Waterways Trust Fund is a pretty successful example of spending down. That program started in about 1980 with, I think at that time, about four cents on every gallon of diesel fuel that was used by the tow boats in propelling the barges. That rose to about 10 cents in 1987 and 1988 and is slated to go to 20 cents by 1995.

At the present time, we have collected and expended some of those resources, and we now have about $300 million in the fund. Fifty percent of the new construction of our locks and dams is funded by that fund, with the remaining 50 percent from the general treasury.

We have eight projects now under construction. We probably have about another eight or 10 on line. The latest figures that I saw showed that by 1994 or 1995, that $300 million will probably be down to less than $100 million as we use the fund for construction of the eight locks and dams that we now have underway.

Mr. **Stangeland**. Just one last question—water quality improvements are one area of infrastructure investments that are mandated by statutory performance or standard-based criteria, most notably, secondary treatment standards for municipal sewage treatment plants. Would an emphasis on level of service and strict cost/benefit analysis apply to the construction of those treatment plants, perhaps resulting in a different level of water quality needs than that which is based on the current law's mandates?

General **Kelly**. That's a good question. Whether or not you need a waste water treatment plant is one thing. The cost/benefit analysis certainly would help there. But when you get involved in meeting regulatory requirements, that is when you need to have a lot of flexibility. Whatever strategy you develop has got to accommodate that.

Mr. **Stangeland**. I am often of a mind that we treat to meet a certain standard rather than checking the quality that comes out of the pipe in the end.

General **Kelly**. That is right.

Mr. STANGELAND. I want to thank you very much for your response, General, and look forward to working with you.

General **KELLY.** Thank you, sir.

The **CHAIRMAN.** Mr. Bosco?

Mr. Bosco. General, thank you for your presence here today. I know you have had to wait a long time to offer your testimony, but it was excellent.

I don't mean to be single-purposed in these hearings, but I am very concerned about the amount of time and money that gets wasted in the system. I know that it isn't always viewed as a waste, but in terms of your experience, are you finding that in building projects and in getting out there and actually moving the dirt to create what Congress asks you to create that it is getting worse or better in terms of the delays, the court suits, the bureaucracy, the red tape? I don't need to go further, but tell me: what is the picture out there?

General **KELLY.** I know you are probably going to be amazed by my answer, but I think it is getting better. Our experience in the last three years, since the Water Resources Development Act of 1986 was passed which introduced cost sharing and the element of the non-federal sector in working with us in partnership on our projects, has caused us to rethink how we ourselves do our business.

To be perfectly honest, a lot of the problems that we had could not be traced to some of the environmental laws or our coordination with the resource agencies but really are internal, and related to how we manage. We have made a concerted effort to reorganize ourselves. We have an entirely new management approach which looks at one person, a project manager, who will be with that project from start to finish. We look at ways to expedite the whole budgeting and planning process. The planning program typically used to take anywhere from seven to 10 years to take an idea from a local community up to the point where we are actually ready to turn dirt. Now that is down to probably four years or less. Mainly, we are looking at our internal operations and trying to come up with a better management approach.

Mr. Bosco. When you get out there in these communities to build roads, harbors, dams, or whatever, are you finding that you reach less resistance in terms of the bureaucratic requirements now, or is it more?

General **KELLY.** If we involve the community up front in our planning study, city, county, and also State, and we, the Corps of Engineers, let our sponsor act as the project proponent, we find out that they can handle political problems and in many cases environmental problems far better than we can. The combination of that partnership produces a much more effective way of proceeding, and we literally have cut down our time because of that.

Mr. Bosco. Thank you very much. That is certainly refreshing news.

The **CHAIRMAN.** Mr. Emerson.

Mr. **EMERSON.** Thank you, Mr. Chairman.

General, thank you very much for your statement. I agree in large measure with what you have said, generally, and also in your answer that you just gave to the gentleman from California, that as a follow on to the Water Resources Act of 1986, you have had a necessity to rethink your approach to how you do business. I think some very positive things have and can result from that, particularly as we look to the future.

However, there is a problem as we look to the past and to what has not been completed. I refer especially to the Mississippi River and Tributaries Project.

The Mississippi River is one of the most vital transportation arteries in the world. A lot of people don't necessarily think that way. As a matter of fact, there are people down home who don't think of it as that. They think of it as a serious problem to be dealt with, which it very often is, but it can also be our best friend.

I am concerned that the Mississippi River and Tributaries Project is never going to be completed. If we continue with the policy of insisting upon local cost sharing for projects that, as we view things here at the federal level, may appear to be small in dollars, but to a little community of 2,500 or 3,000 people who are seeking to develop economically—they just can't come up with the dollars that are necessary to build the pumping stations and some of the other things that are necessary in looking toward the completion of the MR&T project.

I would hope that we could go back and revisit that policy that resulted because of the 1986 act and that we could go ahead and finish the MR&T project as it was conceived. I think it is, what, about 85 percent complete?

General **Kelly**. It is generally in that vicinity.

Mr. **Emerson**. I think we ought to go ahead and finish it by the same ground rules that the 80–85 percent was constructed under because what we are talking about is a lot of small projects in the lower valley, small projects in relative terms to what we talk about in this committee and in other committees of the Congress, but that are real obstacles so far as local communities coming up with the cost share.

Another problem that lies out there as it related to infrastructure, quite frankly, is the wetlands issue and what impact section 404 is going to have upon our system of levees and drainage districts and drainage ditches and what have you. We know that this is up in the air right now.

I represent a district that is the boot heel of Missouri, which was once a swamp in its entirety. It was drained under the act that you referred to. I have gone back and read the old documents that came along talking about the surveys in the 1830s and 1840s as they related to Southeastern Missouri. Ultimately, we were drained and now we have some of the richest farmland in the world and we certainly do not want to revert to being restored to our original wetlands characterization. We have come a long way since the 1830s and 1840s.

We believe in mitigation and conservation and most farmers are also duck hunters, but we have got to get a better definition of wetlands than we now have. I realize that it is not just the corps that is involved here. There are several other agencies of the government involved and we are competing for whose definition is the right definition.

I know that you are presented with terrible 404 problems even as it relates to catfish ponds and rice levees. I encourage you to move forward in deliberations on this subject so that we really know what we are dealing with. If necessary, Congress can respond and write into the law one definition of wetlands as opposed to the current four that exist. There is massive confusion out there.

This is not something that can afford to be put on the back burner for a long time. It is something that we need to deal with much sooner rather than later.

General KELLY. We have addressed that partly in January of 1989. We finally agreed with the resource agencies on a common wetlands definition and criteria that we now use. That has at least standardized and simplified the approach. We continue to work with the resource agencies to make sure, though, that we always have a proper balance as we apply that definition and criteria.

Mr. EMERSON. Thank you, and thank you, Mr. Chairman.

The CHAIRMAN. Mr. Nowak?

Mr. NOWAK. Thank you, Mr. Chairman.

It's nice to see you this morning, General. We have covered a lot of different areas this morning.

You are before the committee with this very broad view of the infrastructure needs. Certainly, the Corps of Engineers has played a very important role in certain of these areas.

You discussed earlier the Inland Waterways Fund and made the remark that you have $300 million in there as an approximate fund balance at the present time and have under consideration 8 to 10 different projects that would draw down the fund as you went forward.

General KELLY. Mr. Nowak, those are already under construction. The fund is being drawn down now because of those 8 to 10 projects.

Mr. NOWAK. You mentioned that you had eight already under construction and that you had eight or 10, which is the number you used, under consideration for the future.

General KELLY. Yes, sir, that is correct.

Mr. NOWAK. You mentioned that by 1994, you would be down to $100 million.

General KELLY. That is correct.

Mr. NOWAK. The drawing down of that amount to $100 million, knowing the distance that we have to travel in rehabilitating one large lock or small lock for that matter—I am wondering, even with the increase in the fee—we set this up as a consensus kind of alternative for user fees that would make sense for this segment of our transportation industry—I am wondering if you can match the projections against the local cost that is going to be funded from this $300 million? If they match up over, say a 10 year period, as we get into these other eight or 10 projects that are anticipated to come under construction in the years ahead, do we have adequate resource in there to fund and keep that lock and dam system open?

General KELLY. It will be close. A lot depends upon the growth in the barge traffic. That is projected to be about 1.5 percent per year. It also depends upon the inflation index and the interest rate. If you go through those calculations, for every 10 years, under existing conditions, we can probably add about three or four new lock replacements during that period.

Mr. NOWAK. Does the Corps have a system planned out for replacing a specific lock in a specific year frame that you match up with the revenue that is generated?

General KELLY. Yes, we do.

Mr. NOWAK. I wonder if we could have that for the record?

General KELLY. Certainly, sir.

[The following was received from General Kelly:]

ASSESSMENT OF ALTERNATIVE ASSUMPTIONS OF OUTLAYS AND REVENUES FOR THE INLAND WATERWAYS TRUST FUND

Prepared for the

Inland Waterways User Board

27 March 1990

QUALIFYING STATEMENT AND DISCLAIMER:

This document presents a series of projections for the Inland Waterways Trust Fund based on alternative assumptions of growth in receipts, alternative interest rates and alternate combinations of potential outlays. These projections are for macro-planning purposes only. No final determination of the economic justification or environmental acceptability of projects, no final decision on the cost, size, or location of future projects shown, and no Administration or Corps of Engineers commitment to request funds to proceed with potential construction are implied with this analysis except for projects under construction or proposed for construction in the FY90 Budget.

U.S. ARMY ENGINEERS INSTITUTE FOR WATER RESOURCES

CASEY BUILDING, FORT BELVOIR, VIRGINIA 22060-5586

ASSESSMENT OF ALTERNATIVE ASSUMPTIONS OF OUTLAYS AND REVENUES FOR THE INLAND WATERWAYS TRUST FUND

DISCUSSION

The following analysis of the Inland Waterways Trust Fund is based on available information from the Life Cycle Project Management (LCPM) system and guidance provided by the Planning Division, HQUSACE. Five alternate scenarios of new or replacement lock and dam construction projects are analyzed, each at two different inflation and interest rates. The five scenarios are as follows:

a. Eight projects under construction or in the construction program;

b. The eight above, plus Inner Harbor Lock on the GIWW at New Orleans;

c. The eight above, plus McAlpine Lock on the Ohio River;

d. The eight above, plus McAlpine, plus a single replacement lock and dam on the Monongahela River for existing Mon Locks 3 and 4.

e. The ten above, plus Inner Harbor.

Each of these five scenarios is analyzed twice using alternative assumptions of inflation and interest rates. These are as follows:

1. OMB: The LCPM system provided construction cost estimates and schedules of expenditures by year for the eight authorized projects now under construction or in the construction program and for McAlpine Lock and Dam. These estimates were prepared using OMB guidance on inflation (averaging 2% annually) and an assumed interest rate of 6%. For the two remaining projects (Inner Harbor and Mon 3&4 Replacement) for which schedules of expenditures are not available, a "normal" (bell-shaped) distribution of expenditures is assumed. For the single replacement structure for Monongahela locks 3 and 4, project cost and start year estimates are from the Inland Navigation Regional Investment Plan (July 1989). Due to uncertainties over the type and location of a replacement lock for Inner Harbor, November 1988 cost estimates and an eight year construction schedule have been used to be consistent with earlier analyses presented to ASA(CW) and the Inland Waterway User Board.

2. DRI: A second analysis of each of the five construction scenarios was performed using an alternative rate of inflation (5%) and interest rates (8%), which are in line with forecasts developed by Data Resources Inc. (DRI) and other private analysts.

CHANGES FROM EARLIER ANALYSES

Expenditure schedules by year have been changed for several projects from earlier analyses presented to ASA(CW) and the User Board, based on the latest available information from the Life Cycle Project Management System. Slightly lower expenditures are expected in the near term for Gallipolis and Oliver, but are offset by higher expenditures in later years. Total projects costs are essentially unchanged from earlier analyses, except for Olmsted under higher inflation assumptions. Construction at Winfield runs a year longer to 1996, spreading the previous 1995 outlay over two years. The most significant changes are at Olmsted, which shifts sizable expenditures from years 1993 through 1996 to 1997 and later, as well as running a year longer to 2006. Lastly, a schedule is now available for McAlpine which indicates lower outlays through 1997 and higher outlays afterward than were presented in earlier analyses.

FINDINGS

The results of the analyses are presented in the following series of tables and graphs. Each scenario (A - E) has four tables (1a, 1b, 2a, 2b). Tables 1a and 1b address the project cost and trust fund balance using OMB inflation and interest rates, while tables 2a and 2b show DRI inflation and interest rates. Scenario E includes two additional tables (for a total of 6) to assess the impact of delaying project construction to avoid a deficit in the trust fund (discussed in greater detail below). The graphs show the impact of these alternative construction scenarios on the trust fund balance. Figure 1 shows the balance with construction of all eleven projects under both inflation analyses and with the delay in the construction start year. Figure 2 is a composite of several construction scenarios using the OMB inflation rate. Likewise, Figure 3 is a composite of several construction scenarios using the DRI inflation rate.

OMB: Under inflation and interest rate assumptions from OMB, all projects can be built under each scenario based on project construction costs and schedules of expenditures provided. The revised outlay schedules for McAlpine and Olmsted (delaying more of the outlays to later years) permit construction to start at Inner Harbor and Mon 3 & 4 (replacement) on schedule without causing a deficit.

DRI: Under the higher inflation and interest rate assumptions from DRI, all projects can still be built on schedule under scenarios A through D. However, in scenario E (all projects), Inner Harbor Lock cannot be constructed on schedule in 1995 without causing a deficit in the trust fund during the period 2000 -- 2002 (see Table E-2b-1). If trust fund expenditures are then constrained to avoid a deficit, construction of Inner Harbor Lock must be delayed two years to allow sufficient revenues to accumulate (Tables E-2a-2 and E-2b-2). This delay shifts peak expenditure years for Inner Harbor until after 2000, when expenditures for Olmsted and McAlpine are declining.

In summary, this analysis shows that the eight projects now underway can be built on schedule, even if inflation runs higher than OMB is estimating. In addition, another lock on the scale of the project envisioned at McAlpine ($265-348 million after inflation) can be initiated in 1995, plus another project in 1998 on the scale of the Mon 3&4 Replacement ($380-525 million after inflation), without causing a deficit in the trust fund. However, a project on the scale of Inner Harbor ($6C5-818 million after inflation) cannot be funded in 1995 (in addition to the other ten projects) if inflation runs closer to DRI forecasts and would have to be delayed until sufficient revenues accumulate in the trust fund.

The tables and figures follow. Table 1 offers a summary of total project cost, uninflated and for each inflation scenario. Tables A-1a through E-2b-2 follow, displaying the results of each scenario. Figures 1-3 provide graphs of the impacts of the various scenario analyses on the trust fund balance.

TABLE 1

Mr. **Nowak**. As we move forward and we look at the broad range of infrastructure, user fees are going to become more and more prominent. We may not raise taxes, but we are going to enhance revenue through user fees, probably, and the airport tax of this year, or airport user fee, I guess we should call it. I am just wondering, in this system which is so important to so many in our country, is there no opportunity for any of the locks to fail before their scheduled maintenance or rehabilitation is performed? I don't know what assurance you could give me here except that they are being inspected on a regular basis. Is that correct?

General **Kelly**. Of course, the older the lock, the more frequent it is, but generally, we go into a major maintenance cycle for most of our locks and dams about every six to eight years.

Mr. **Nowak**. The problem we had with a little lock up in Welland, Ontario, which takes the 26-foot draught ships through the Welland Canal and up through the St. Lawrence, was that one of those caved in a few years ago, as you know. We had 400 or 500 boats that had to change their schedules while that was being put together again. It was a huge cost to those Great Lakes shippers as well as to everybody else that had a role in that system.

Do you feel that there is enough preventive maintenance that you would not have a closure or cave-in of that magnitude on our lower locks?

General **Kelly**. We probably do not have enough operations and maintenance funds to handle it to the degree that you have just described, but with what we have, I think we do a pretty efficient job.

Mr. **Nowak**. They are all operating, but I sense from many of the barge operators that they are very, very concerned that something like that could happen if we do not at least increase the inspections and look at the real possibilities of something closing. As you well know, once a lock is closed, that whole system may be shut down for the entire season.

General **Kelly**. Yes, sir, a lock closure is extremely costly.

Mr. **Nowak**. I would appreciate any recommendations you could give me of increasing those kinds of inspections to be as sure as we possibly can be. Since we have the user fee money there, I would think that perhaps it would be prudent to use some of that for that kind of inspection. If you needed more authority for that, as you know, we will be looking at passing a water resources bill this year again. With the projects already submitted, it seems to me that it would be a relatively small amount of money to ensure against a great disappointment.

Let me turn to another subject. The change over the last several years in the Corps' leadership has made a large difference in a factor that you mentioned, the management of the system, so that a project, once undertaken and started into, has had its time frame shortened from that seven to 10 years down to about four years before we can move into it. Along with that improvement, the Corps is to be congratulated on another large development. It is really a reality, not a perception, of the Corps' looking at a broader environmental impact.

I think that you touched upon it when you mentioned the kind of cooperative ventures that you are entering into with the cost sharing. The broader input that you are getting on the front end and the local input have really made a terrific difference in several of the projects that I have gone out to see, especially the terrific kind of response the Corps' people have had with the community leaders and the communities in general. I think that extra effort saves an immense amount of time and dollars on the other side of the road.

I would hope that you would encourage and keep broadening that perspective. I think the Corps' reputation for building sort of overshadowed its environmental perception out there, but I think that is changing, too. I think that a lot of people can look forward to that kind of involvement and I would encourage that as you go along with the whole Infrastructure Task Force that you are dealing with. I think that will enable a lot of these projects to move forward in much better shape.

I congratulate you for all the improvements you have made and look forward, of course, to the water resource bill as we move forward this year.

General KELLY. I might point out, Mr. Chairman, that both Assistant Secretary Bob Page and my boss, General Hatch, feel very, very strongly about the fact that there is a major role for the Corps of Engineers to play in solving some of our environmental problems. It is going to require engineering solutions, and they have the Corps working very closely with the resource agencies and the environmental groups to try to address that. Your perception is absolutely correct.

Mr. NOWAK. It has been my experience that the environmental engineers in the Corps have great expertise and ability. I think it just has to be released and shown to the general community that there is that very deep, abiding concern.

Maybe it is a shift. We talked about the history of the Corps going out West to do a different mission. It may be that that mission is shifting now, especially when we look at the tremendous release of energy that the Corps could have positively in this whole infrastructure area, not only in the water resources portion.

There are an awful lot of small bridges and roads that could be worked upon. We look forward to your involvement in all of these areas.

General KELLY. Thank you, sir.

The CHAIRMAN. Mr. Geren?

Mr. GEREN. No questions, Mr. Chairman.

The CHAIRMAN. General Kelly, thank you very much for an excellent presentation.

General KELLY. Thank you, Mr. Chairman.

[The prepared statement of General Kelly appears on p. 119.]

The CHAIRMAN. Our next and final witness today is Mr. John Horsley, the Chairman of the Board of Commissioners of Kitsap County, Washington, who founded the Rebuild America Coalition.

Rebuild America is a broad coalition of about 50 public and private organizations committed to the infrastructure challenges and the need to protect America's investment in the entire range of public facilities.

Mr. Horsley, we appreciate the work that the Rebuild America Coalition has done in addressing America's infrastructure problems and in providing solutions to those problems. We look forward to hearing from you today.

TESTIMONY OF JOHN HORSLEY, CHAIRMAN, BOARD OF COUNTY COMMISSIONERS, KITSAP COUNTY, WA, REPRESENTING THE REBUILD AMERICA COALITION

Mr. HORSLEY. Thank you, Mr. Chairman.

On behalf of the Rebuild America Coalition, we want to thank you very much for you leadership, Mr. Chairman, in holding this series of hearings that are of vital interest to the future of our country. This particular hearing reminds me of a session we held with the Board of Supervisors in Los Angeles about 2 or 3 years ago where you and Mr. Howard very patiently listened through reams and reams of testimony of just about every local official in Southern California.

I was the last witness then as well. I am convinced, Mr. Chairman, that you have a cast iron constitution.

What we are prepared to do in our presentation today is to present considerable documentation that the various members of the Rebuild America Coalition have put together. You see many of the displays across the back of the room documenting the tremendous need for action. The Rebuild America Coalition has put together this latest document, "America's Infrastructure: Preserving our Quality of Life," which we are passing out to each member of the committee and which we want to submit for the record.

In a few minutes, you will get to see a video tape that your committee staff, with the technical resources of the Rebuild America Coalition, put together for use here in this committee and hopefully in other settings to tell the story. Before we get to the video tape, I would like to do two things, Mr. Chairman. I would like to submit our formal presentation for the record. It has been a long morning for all of you and we respect your time, so I ask it that be placed in the record. Then I would like to make some brief remarks before we get into the video tape.

The CHAIRMAN. With no objection, we will take your statement as I have it here. That will be made a part of the record.

Mr. HORSLEY. Thank you very much.

Mr. Chairman, on behalf of the Rebuild America Coalition, let me say that we are optimistic today. With the dramatic changes taking place around the world, especially in Europe, we see the Cold War fading and a new recognition of the dynamics of what lies ahead as to the future of the United States and our interests. There is a broadening realization that the challenge ahead will perhaps be more economic than military. As that dawning strikes all Americans, from the grassroots level where we are up to the national level, what that is telling us is that perhaps it has come time to reassess our priorities on how we are allocating federal resources, State resources, and local resources.

One of the most telling charts that you see behind you is the relationship between capital investment and productivity. The United States, which is spending less than one percent of our GNP, also ranks lowest of the seven industrialized countries cited there in the increase in the rate of productivity. That is a telling study that was done a couple of years ago by David Aschauer that I think has awakened a lot of people to the necessity to invest more.

Mr. Chairman, as you have followed this issue over the years and as we from the local level have—and we in the coalition are county and city officials, professionals that build and maintain the systems, as well as the private sector, the builders, the contractors, the architects, the engineers, the financiers that are putting these systems together. What we have seen demonstrated repeatedly—and General Kelly just went through "Hard Choices 1984," says that we have got to do more. We have a widening gap.

"Fragile Foundations" documented that we had to spend far more, perhaps doubling our effort by the turn of the century. The most recent study that just came out this week, "Rebuilding the Foundations," tells you that if the Federal Government continues to shift the burden not only for social programs but also for capital spending programs, we are not going to get there by relying on local government because we can not shoulder both burdens.

Finally, we all recently saw Secretary Skinner and President Bush's national strategy "Moving America into the 21st Century." Mr. Chairman, if we depend on the strategy that has been operative in this town for the last eight years in dealing with this question, we are not going to get to the 21st Century.

We are here to tell you, Mr. Chairman, that if we rely on the policies of pass the buck and shift and shaft, America is not going to get to the goals set by the Council on Public Works Improvement two years ago that said that we had to increase 100 percent the capital investment we are making in the basic public facilities that this Nation's economy depends on. Let me quote from that study where it say what we truly need.

It said:

> We need a national commitment shared by all levels of government, the private sector, and the public to increase infrastructure spending 100 percent by the turn of the century. The Federal Government must act as a full and responsible partner to increase and sustain capital investment.

This last couple of years, Mr. Chairman, as you are aware, 18 States have increased their gasoline taxes. Two weeks ago, my own State of Washington added a nickel to our 18 cents per gallon base, so there are 19 States that have stepped up to the problem in transportation.

In my own County of Kitsap, we lead our State in the formation of county road improvement districts where property owners petition us to increase their property assessments and upgrade roads or build brand new roads for a county that is one of the fastest growing in our State. We are increasing our garbage rates. Our State Public Works Trust Fund, on which I serve, has increased our annual revolving loan fund to counties and cities and special districts from $16 million per year to $40 million in this coming year.

States and localities across the land are stepping up to this problem, but our federal partner, in the pattern over this last eight years since we have recognized the crisis that is upon us, has had a pattern of either cutting back on the grant assistance you have allocated or in the tax acts, such as the TEFRA Act of 1986, making it more difficult rather than easier for us at the county, city, and State levels to assume a greater share of the burden.

The plea that we make to you and this committee and the Congress and the President, Mr. Chairman, is to join us as partners. Step up to the problem together with us. Together, we can achieve that 100 percent increase that the Council on Public Works Improvement recommended.

Let me cite four feasible suggestions that are doable even in this era of Gramm-Rudman and deficit politics. No. 1: don't cut these programs anymore. If you recognize how important capital investment is to the future of the economic competitiveness of our country, then take them off budget, as has been recommended. Don't cut these programs anymore.

No. 2: spend down the trust funds. A remarkable agreement was reached this past spring between the governors, state legislators, the Conference of Mayors, the League of Cities, the National Associations of Counties, Government Finance Officers and City Managers. All seven of these organizations this spring have designated their number one priority as being to increase the obligation ceiling in the Highway Trust Fund from $12.3 to $15 billion. It is doable, Mr. Chairman. That will require in this budget year only an outlay of an additional $400–$500 million to get a payoff of $2.7 billion more on the street improving the facilities that all of us depend on.

A similar move is recommended by Rebuild America in the Aviation Trust Fund. So let's put the trust back in the trust funds. That is our recommendation number two.

No. 3: in consultation with the Ways and Means Committee—and I know, Mr. Chairman, that you have submitted legislation along these lines which I believe is going to have tremendous interest and support among the members of the Rebuild America Coalition—but let's make the tax code friendly once again to our efforts to try to do more. The tax revisions of 1986 placed more obstacles in our path than it opened doors. What we need to do is to revise the code and see if we can turn the corner.

The final recommendation is to look to the arena of policy and strategy—and this is coming from John Horsley, a county commissioner who has been observing these conflicting actions at cross purposes that are taking place at the federal level that run exactly counter to the objectives that everyone in this room, I think, has in mind. If we are to do more, then what we should do is have a Federal Government that enters into a knowing partnership with State and local governments and the private sector to achieve these goals.

Right now, Federal policies are hampering our ability to do more. We need a national strategic approach, a national policy, on how we are to achieve the goals set out by that National Council in 1988.

Mr. Chairman, there are substantial amounts of documentation of the need, and I know that is what you were after in this kickoff hearing. I think that it is more graphically presented in the video that you are about to see, so I will close my testimony with this offer.

The Rebuild America Coalition came into existence because of the perception of local and State governments and our private sector partners that for the future of our country, we had to invest more in these vital facilities. We know this committee shares those goals. What we want to offer is our assistance in helping you convince the rest of Congress and the Administration to join with all of us in moving this agenda ahead.

Thank you very much.

The CHAIRMAN. We will hold our questions of you until we complete the video.

[The text of the video presentation follows:]

Our Nation's economy has grown up on the road, but those roads, the Nation's infrastructure, are in dangerous disrepair. Sixty percent of the Nation's four million miles of highway are in need of some form of service rehabilitation and 40 percent of the Nation's bridges are in need of work or are so old that no one really knows for sure if they are dangerous.

Truck driver Charles Taylor sees it all. He has made his living on our infrastructure for 20 years. Something is going to have to be done. It's tearing up the equipment and it's just difficult. These bridges and stuff are breaking springs and when you are tearing up equipment, the truck becomes unsafe. You never know what will happen.

Transportation Secretary Samuel Skinner is calling for a national policy to deal with this creeping crisis.

Reporter: It has been estimated that we need to really double our investment in the infrastructure. Do you think that is a proper assessment?

Mr. Skinner: Well, I think we have to increase it significantly. I am not so sure that the amount isn't even more than that.

Reporter: We spend a lot on our space program. Would you make the suggestion to the White House that we need to take some of that money that we are spending on outer space and spend it on our infrastructure inner space?

Mr. Skinner: Well, I hope we don't get into a fight over where the money is going to come from. We have a lot of unique opportunities in transportation to generate funds, developer impact fees, State and local gas taxes, user fees, so there are a lot of things that can be done that won't impact on the Federal budget at all. Those are the things we are going to be looking at.

But if there is no change in the way the Nation's infrastructure is maintained, it is estimated that by the year 2005, delays on these highways will cost an estimated $50 billion in lost productivity, lost wages, and wasted gasoline.

The greatest fear comes from scenes like this bridge in Upstate New York that gave way back in 1987. Ten people were killed. It is not an isolated incident.

In March of this year, a bridge 50 years old gave way over the Hatchie River near Covington, Tennessee. Eight people lost their lives under the bridge debris.

The Nation's bridges are aging, even though they are being repaired or replaced at a rate of nearly 3,000 per year. They have estimated that it will take more than 80 years to repair all those bridges that need work now.

A bridge over the Great Miami River near Cincinnati also gave way this year. There was some warning though. State and private sector inspectors tried to close the bridge, but it was too late. Two drivers lost their lives.

What about the future? Near New Orleans, I-10 crosses hundreds of miles of swamp land. One-third of the interstate system through Louisiana is on what engineers call elevated roadway. The same is true for the neighboring State of Mississippi.

Near Biloxi, many old bridges are not crossable and have become fishing piers. Those kinds of highways can not be simply repaved. They must be structurally replaced when they wear out, at a cost of up to $10 million per mile.

Dr. Thomas Larson, newly appointed Administrator of the Federal Highway Administration says that the system is functional for now.

Reporter: Are our grandchildren going to have to go back to covered wagons?

Mr. Larson: I don't think so. As a matter of fact, we do monitor the condition of highways by a sampling process with participation from all the States. The results are that the roads are getting modestly better.

Maybe modestly better, but in urban areas, mostly more crowded. It is not just safety that is at stake in the race to repair the Nation's highways. It is productivity, and that is what concerns Transportation Secretary Samuel Skinner. Obviously, in the metropolitan areas, the infrastructure is used by many, many more people. So on an impact of productivity basis, the impact of deteriorating infrastructure in metropolitan areas has a greater drain on productivity and a greater drain on jobs.

The Nation's roads and bridges are in dangerous disrepair. The Bush Administration is seeing this issue unfold as an item on the top of the checklist for fixing. But there is more to the Nation's infrastructure than just potholed streets, faulty bridges, and the clutter that construction causes. There is rail, ports, and airports. What about our ports? Federal Maritime Commissioner Frank Ivansey says that for the most part, they are in good and safe condition, but he has dreams of expansion. I think we will have to develop a system of dedicated corridors to the ports where you have exclusive use by truckers, trains, and so forth, to the ports and off from the ports, in other words, so that you have a corridor that does not conflict with normal traffic flow of the city. I call it a dedicated corridor.

That is what is on the drawing board for Baltimore and many other cities. Federal planners are watching the private sector draw up the plans.

As for the Nation's airports, congestion and worries about safety are the key concerns of consumers in the wake of deregulation. The airlines are now logging 320 billion passenger miles per year, and the number of airports classified as seriously congested is expected to climb from less than 20 now to almost 60 by the year 2000.

The most frightening thing about our infrastructure's decay is when a bridge collapses and lives are lost. Maritime Commissioner and former Portland Mayor Frank Ivansey worries about the management capabilities of elected officials in those cases. I don't necessarily appreciate the fact that some cities all of a sudden find out that they have a bridge that is falling into the river. Actually, that bridge has probably been deteriorating for many, many years, so who was sleeping at the switch?

There may be a solution to this problem in the private sector. The toll gate is an age-old way of paying for bridge and road construction, but public servants taking tolls have always been a political problem. Elected officials don't like to be the ones blamed for taking their voters' money at the booth.

Several news accounts follow.

A concrete block fell onto a car and the driver is in very serious condition. It was the FDR Drive in Manhattan, the elevated part of it at East 23rd Street.

It's an old road in disrepair in a lot of places. Some people would say it was an accident waiting to happen. In any case, it did happen. The road fell through; a man is hurt. Kathy Wilke is live at the scene.

Bill, we are live at 23rd Street and the FDR Drive where traffic is not moving northbound tonight because of a concrete slab which, as you say, fell from the FDR Drive onto this access road below and onto a motorist. The car is right behind me. The concrete is still on the hood; the windshield is completely smashed in. What you are looking at is a navy blue Plymouth Reliant with New York plates.

We are told that the victim is a white male in his thirties or forties. We don't know much about him except that he is still in the emergency room at Belleview Hospital. Doctors are working on him now. He's in very, very critical condition.

All of this happened at approximately 9:08 tonight. A concrete slab about five feet by 10 feet and six inches deep fell at least 30 feet to the car below. It weighed some 400 pounds.

In Tennessee, divers continue this evening to search for victims of a bridge collapse. The 50 year old bridge on U.S. Highway 51 collapsed last night plunging at least one tractor trailer and three other vehicles believed to be cars 25 feet into the Hatchie River.

So far, rescuers have pulled seven bodies from the water. It is still not clear what caused the bridge to give way, but it had recently rained and the Hatchie River was almost three feet above flood stage at the time of the accident.

Exactly two weeks after a bridge collapse in West Tennessee, State transportation officials have another bridge collapse to deal with. This time in the eastern part of the State.

A pickup truck carrying three teenagers plunged 25 feet onto a railroad track following the collapse of a one lane wooden bridge. The mishap occurred Saturday night about 25 miles northwest of Knoxville, killing 16 year old Ronald Galliher and injuring two passengers.

And there is more news tonight about the Hatchie River Bridge that collapsed near Covington two weeks ago.

Tennessee Department of Transportation records show that inspectors recommended repairs on the bridge following checks in 1985 and 1987. Inspectors found evidence of erosion around the bridge supports. However, maintenance reports show no changes were made. On April 1st, eight people died when the U.S. 51 bridge collapsed.

The next three reports are from ABC Evening News with Peter Jennings.

Our reporting on the American Agenda tonight was inspired by what we saw happen in San Francisco last week. While is was the earthquake which finally brought Highway 880 down, there is a lot of evidence that years of neglect made it possible.

One thing is for sure: there are roads, bridges, and underground pipes and other public works in terrible shape all over the country. Forty-four percent of bridges alone are judged by the government to be structurally deficient or functionally obsolete.

We have three reports tonight on America's infrastructure. First, here is ABC's Al Dale.

Last April, eight people were killed when a bridge near Memphis fell into the Hatchie River. Two weeks later, a teenager died in the collapse of a wooden bridge, also in Tennessee. Those accidents underscored the nationwide problem of aging bridges and the lack of money to repair or replace them.

Tennessee immediately stepped up inspections and closed four bridges. Other States, including Georgia, took the cue. But Georgia has only 18 inspectors for its 14,500 bridges, and the $39 million in Federal and State funds allocated for bridges here last year, is far from adequate. We will really be stretching the life span of some of those bridges at the rate we are going now before we are ever able to replace them.

Officials say that it is difficult to convince taxpayers to fix or replace bridges until one falls. For example, a recent bond issue to replace aging viaducts in Atlanta was voted down, and heavy fire trucks now have to detour around the problem. Al Dale, ABC News, Atlanta.

So the system is above ground, but is also below with the systems that supply us with water and heat and also dispose of wastes. Here is ABC's Ron Clayborn in New York.

Beneath this city are more than 6,000 miles of water mains, gas lines, and steam pipes. As the aging system breaks down, the city struggles to keep up. The water mains are in pretty bad shape. They haven't really been changed in the last 60 to 70 years.

Some pipes are more than 150 years old. Engineers say that the problem is not so much age as stress. Traffic from above and subways from below are causing the old cast iron water pipes to deteriorate and sometimes break. Last year, more than 600 water mains burst. When that happens, it can be more than an inconvenience. It can also be dangerous.

This summer, a water main break led to the explosion of a nearby steam pipe, killing three people and spewing cancer-causing asbestos into the air. More such incidents seem inevitable. When a water main breaks, it affects the steam line. As the steam line's got asbestos in it, you're going to have asbestos all over the street.

Changing all the crumbling pipes would cost billions. The city says it is more cost effective to let them break and then replace them. Ron Clayborn, ABC News, New York.

And the problem is everywhere. The National Council of Public Works Improvement, a group created by Congress to monitor the condition of America's infrastructure, makes the point that reliable transportation is one of the basic elements of a productive economy. On that problem, ABC's Chris Burey.

In Chicago, many of the rails and roads are aging and frail. Chicago's Loop, the elevated train structure that circles downtown, was built in 1892. Trains must slow to six miles an hour because parts of it are unsteady. The steel is so old that portable jacks help hold up the tracks.

Here, too, many bridges are rusty and rickety after decades of heavy use and bad weather. Nearly a third of the State's 25,000 bridges are considered substandard.

The problem in Chicago, as elsewhere, is money. Politicians find it easier to raise taxes to build new sports stadiums than they do to fix old bridges. "When you vote for new bridges, new rail tracks, the public typically doesn't see those improvements. They are not ribbon-cutting kinds of events that politicians like, so it's a very, very tough sell."

In Illinois, a new gasoline tax will raise an extra $300 million a year for renovations, but it cost nearly that just to rebuild one bridge. Demand for repairs far outstrips the supply of money available. Chris Burey, ABC News, Chicago.

Just one other note. Last year, all levels of government were spending $45–$50 billion to repair the infrastructure, in other words, just to keep it in as bad a shape as it's in. Everybody agrees that it will cost vastly more to fix it.

The CHAIRMAN. Thank you very much, Mr. Horsley, for making this video presentation available.

Mr. HORSLEY. My compliments to your staff as well. They put it together.

The CHAIRMAN. Very good.

I have just one question I was going to ask. One important aspect in dealing with the infrastructure issue is to get the general public focused on the scope and the urgency of public works' needs. How do we most effectively get the message across to the public that the future quality of all of our lives and of our economy and everything else is pretty much at stake?

Mr. HORSLEY. I have a couple answers to that, Mr. Chairman.

I brought with me a copy of a manual, a workbook, called "Building Together: Investing in Community Infrastructure." This was a joint project that Dale Stuard, who was at the time President of the National Home Builders Association, and I, as President of the National Association of Counties, launched our people on. It came to fruition this year under the leadership of NACO President Ann Klinger.

This is now on the street and is being used in counties throughout America where county officials like myself go to the community. It is available to city mayors and city councils as well to explain at the grassroots what the problem is and what some of the solutions are so that we begin to build the understanding and base of support from the grassroots up.

The second part of the answer, Mr. Chairman, is not going to be quite as pleasant. Let me be blunt. It does not help us at the State and local levels screw up the courage to raise fees, raise taxes, raise rates, to fund our share of local infrastructure as long as the debate from the federal level is based on hero politics: shift the problem down to our level and shift the shaft politically to us while you are above the fray refusing to raise taxes no matter what.

We are all in it together. The same media that covers you covers us, and the same voters that vote for you vote for us. They are confused if the message that comes from the Federal level is that any politician who would raise a rate or raise taxes is wrong. We have got to get into a partnership situation where the voters face up to the responsibility and we as leaders face up to the responsibility together.

The CHAIRMAN. Mr. Stangeland?

Mr. STANGELAND. Thank you, Mr. Chairman.

I appreciate your being here, Mr. Horsley. That is an excellent tape and the statement is so true that people will support a bond issue to build a sports stadium, but not to repair roads and bridges.

I served eight years in the State Legislature in Minnesota, and whenever we talked about a gas tax increase, the petroleum industry was in there adamantly fighting it and the people didn't want it, and yet, it was a direct benefit to them. They never see the need until the traffic jam is there.

Mr. HORSLEY. You bet.

Mr. STANGELAND. No matter how hard you try to sell it, it is a hard sell until the bridge falls down.

I am troubled, and I know that the Federal Government has a major role to play. I think what we try to do is to balance the responsibility as much as possible.

Sometimes I think, as I look around the country, we probably have not got our priorities right as far as road construction and road repair, but the costs have gone up.

Where we are blessed in this country is that we had forefathers with great vision to put our infrastructure in place. When you look at places like Argentina, Brazil, and the Soviet Union, if they had our system of infrastructure, they would be powerful competitors, particularly in agriculture, but in other facets as well. We have it, but now we have to rebuild it.

The rebuilding is going to cost horrendously more than the initial construction. Repair of a mile of interstate today costs as much as the construction cost to begin with, and it is a problem.

I just salute Rebuild America and I just have to take a moment to salute our former Chairman, Jim Howard, who was one of the visionaries who saw that something had to be done, that we had to start talking about this. He put together a piece of legislation that discussed it and is kind of the guy who got this thing going, with all of us focusing on the need and also with the intertwining.

The other thing our people fail to realize is that we spend money—well, I support projects in some other part of the country and my constituents can not understand that, that improvement in Tampa Harbor benefits my farmers who use the phosphate that is mined in Florida. You just can not get them to realize that money spent somewhere else may in some way accrue to their benefit. They just don't see that. They only see the benefit of money spent right there locally where they can see that project taking place. It is a hard sell, and I think it is a sell that we have got to pull together and work on to get the job done.

Mr. **Horsley**. Mr. Stangeland, I agree that it is a hard sell. The debate that raged this last two years in our State legislature over the nickel that they just added to our gas tax was tough. Interestingly enough, after they failed to pass it in the last session, many of them went home to their chambers of commerce, their Rotary Clubs, their community groups, Kiwanis, et cetera, and were told, "Don't come home again next year without passing it because this community, the economy, the businesses, and our commuters are desperate for improvement."

There was a groundswell in the Puget Sound area. "You have to do something; the gridlock is unbearable." So the citizens and the business community demanded action and they got it.

Mr. **Stangeland**. Thank you very much.

The **Chairman**. Mr. Nowak.

Mr. **Nowak**. Thank you very much for your testimony, Mr. Horsley.

I think that we look at the National Association of Counties in great esteem because over the years they have come forward with some innovation and we try to match that enthusiasm as we get a groundswell in the Congress from many local officials and what the local officials bring from their constituents. Statements were made earlier today that we should go to the local officials.

They have a close feeling because of their representation of what needs to be done. On one hand that is very true. You have identified and others have identified and back in 1983 the needs were identified and the shortfalls were known. They were starting to grow and starting to show up in different aspects, that there was not enough maintenance being done on the system as it was constituted at time.

Certainly, there was not nearly enough being done if we are going to remain economically competitive. Yet, very little has transpired since that time in terms of trying to find a funding mechanism. We can talk about all the innovation we want to talk about, but you have to start with some basic dollars to get the system moving again.

Your four points that you mentioned in terms of your platform that you presented to us is, I think, one that we on this committee can all agree upon. I wonder sometimes how we can move forward without a joining of your organization, the States' organizations. I see that part of your coalition is the National League of Cities, the U.S. Conference of Mayors, and the Council of State Governments.

All must realize by this time that there is going to be insufficient funding if we are going to keep expanding the economy and providing that infrastructure that is going to be able to cope with that expanded economy and move forward. Yet, I do not see—for the last three or four years, I have been talking about a capital budget and I expressed my thoughts earlier today about why we have to separate and why we have to start thinking differently about capital expenditures in this country.

Somehow, we have all kinds of identifications of those needs, yet, very little is being done on the other side. As you rightly said, the States are starting to move on their own without a "Federal aided participation."

We have this fear of taxes, as you mentioned. Yet, when it is explained or when you have a crisis, that fear is overcome. The other nations of the world with Japan in particular—although if you go to Europe and stop at a gas station, you pay the equivalent of $4.25 for a gallon of gas. The difference, of course, is not any increase in transportation from the Arab countries. Their gas is probably 55 or 56 cents per gallon in cost and all the rest is something called revenue for those particular governments.

We have been unable to face this question and I think that unless we do—and there is nothing that comes as close, especially in highway and bridge repair, as the gas tax to a true user-related tax. I am wondering how we get the organizations, some of whom are in your Rebuild America, to communicate this to the Administration.

As you know, there is a policy of no tax now or forever, I guess. That is not going to be a viable way to do any of this expanded work in the future. Not only are we not building out, but we are not maintaining either, so you are going to have, over a period of years—and that is one of the problems. You don't see it happening day by day. All of a sudden, it just comes to a crunch. But how are we going to bring all of the associations to the forefront with recommendations, not on the needs, but on the possible solutions or at least the alternatives, so that this committee and the Ways and

Means Committee can move forward with something that is a true consensus?

Mr. **Horsley**. Mr. Nowak, first of all, let me say that we in Rebuild America support your concept of capital budgeting. That is a fifth point that you can add to the agenda which I did not mention in my four points. That is something that we have advocated for some time and would be pleased to work with this committee toward that end.

On the practical question of how we convince the Administration to come forward and how we move this agenda ahead in Congress, quite frankly, we think that you take it one step at a time and you walk before you run. We are tremendously encouraged, for example, to see Mr. Gephardt, who is representative hopefully of the House leadership, saying that he is ready to take the trust funds off budget and ready to see those trust funds drawn down for the purposes that we have been raising the money for. I think that is a major step forward, symbolically, to have the Majority Leader come by and say that.

I see light at the end of the tunnel. When you came within four votes two or three years ago of scoring on that issue, a lot of people were surprised. The momentum is building and I see you being effective in actually achieving that this year. This year it is do-able.

What we want to do—and you tell us how we can help—is to be your support network at the grassroots level to broaden the base of support beyond this committee. You are our leaders. You know the problem and the solution, and our hats are off to you. But the problem is not as well perceived, understood, and supported elsewhere in the Congress, and we want to help you achieve that broader base of support.

Mr. **Nowak**. Does the organization, especially the Council of State Governors, have any plans in the future to appeal to the Administration to join us in these efforts and to have the Administration look at some of the funding mechanisms? I mean, it is nice to talk about needing a partnership. We are partners; it is just that we are a declining proportion of the whole pie and there is going to be less and less going down.

Certainly, the most successful program to my mind in the history of the country has been the Highway Trust Fund. That has produced. You can argue about routes and everything else from the distribution of those funds, but without that trust fund and trying to rely on a year by year differing appropriation, we would never have been able to build that out in the time frame that we have.

In traveling over in Europe, some of their autostradas and highways have already surpassed us. We had the benefit, of course, of the Highway Act back in 1957, but they are moving very quickly because they have taken that opportunity for the terrific impact on the gas tax.

That area, to my mind, will have to be faced, and that partnership solidified again if we are going to move forward. I do not think that you are going to find the Congress acting no matter how much effort we put forward just on this committee.

There are a lot of Members here and a lot of Senators. But even more important than that in this equation is the Administration, which will have to acknowledge that there is such a thing as necessary capital spending and will have to try to move forward a program that is going to make a difference.

If not, then like many of the other "domestic-side programs," you are going to be ever increasing in trying to keep up with just general maintenance.

Mr. HORSLEY. Let me clarify one thing about the National Governors Association and the Conference of State Legislators. Those organizations are not formally parts of the Rebuild America Coalition. The Council of State Governments is, but the Conference of State Legislators and the governors have joined together with the cities and what we called the "Big 7" in State government lobbying groups who are saying that their top priority this year is the increasing of the obligation ceiling in the trust fund.

Four of those organizations are not members of the Rebuild America Coalition. I just wanted to clarify that, but we have their support, regardless, for the same objective.

Getting to your point about the partnership, Mr. Nowak—and I think you put it very well. What you are saying is reinforced by this report from the Office of Technology Assessment that just came out, I think, last week, where they make this statement: "OTA found that most local government fiscal resources are simply inadequate to fund mandated social programs and maintain and improve public works as well."

The Budget Committee and the various other committees of Congress that are curtailing the funding that States and localities once depended upon to deliver social programs have to understand that the consequence of cutting back in their programs complicates the ability of local governments to maintain their capital spending. So they are compounding the problems of this committee when they shift other programs onto our shoulders when we have to face them with a fixed amount of resources.

We need better coordination between federal policy, state policy, and local policy so that we achieve the goals. From our citizens' perspective, they don't understand which end it is coming from. But on the delivery end, let me tell you, the buck seems to stop at the local level. We think we should have a joint participation in facing up to these responsibilities.

Mr. NOWAK. We have started a series of hearings on the Water Resources Bill and the Clean Water Act this year, and I have had the opportunity to talk to a representative of the National League of Cities, who came in as a mayor urging us to look—since we had the construction grant program and many communities were moving up from primary to secondary treatment and establishing those plants and their operation—they have found that they have another perhaps larger problem staring at them if they are going to meet the water quality goals that were adopted by previous administrations and the House.

That is, of course, the CSO problem. I asked about any surveys that they may have taken in just their member cities. In her community, their cost was several hundred million dollars, and of course, they did not think that they could raise that next year. Therefore, it is going to be postponed.

She was looking at the opportunity, of course, for another type of partnership that we established when we went through the construction grant program, secondary treatment upgrade. Of course, we can not even fund out the secondary treatment to the numbers that this committee has authorized, so to look at new programs, no matter how great the needs may be, we are going to have to have a different funding source and we are going to have to look at some type of partnership for us to move forward in that program.

It is not only in the area of highways and bridges, but when we look at the Clean Water Act, you are going to find tremendous needs out there to meet those goals or else our streams and rivers will keep deteriorating despite the amount of money that has already been put into all of the systems throughout the country.

I would just like to see some kind of local partnership—and maybe this organization can start this—working with the States and your respective governors to come in as a group and to take this up on their agenda. The National Association of Counties could do it, the cities could do it, and the mayors could do it, to bring forward to every Member of the House and certainly to the Administration so that we could put together a program that will start to make a difference in the long term, somewhat analogous to the two areas that have been most successful, the Highway Trust Fund and the Aviation Trust Fund.

If we do not do that, you are going to have tremendous local costs, and I know that local officials hate to comply with State mandates or federal mandates, but that will be the future of this program unless we can put together that kind of a coalition now.

Mr. HORSLEY. Mr. Nowak, I thank you for your observations. I could not agree more. That is why we created this organization, to do that grassroots base-broadening and to help with the public understanding of the issue and to build the political base to see these issues that this committee has worked on so diligently reach the success that we believe is critical to the country's future.

Mr. Chairman, I have to catch a plane in about 30 minutes. I flew in last night from Seattle and this is one of our much feared "Red-Eyes," that I am sure you are well acquainted with.

The CHAIRMAN. Very well.

Mr. Stangeland, do you have any brief questions of our witness?

Mr. STANGELAND. Mr. Horsley, I know you are in a hurry. Let me just take a minute to give you an interesting and comical story to tell you some of Minnesota's problems. We need communication.

Mr. HORSLEY. About half of my home town folks come from Minnesota.

Mr. STANGELAND. Minnesota has Minnesota Good Roads, which is county commissioners, highway engineers, State DOT, and contractors. I believe it was during the last session of Congress that they came in and they wanted the tax exemption on gasohol lifted and they were very adamant about it. In the Congress before, Chairman Howard had an amendment on the Floor because of what that exemption was doing to the trust fund, and I supported that.

In the next campaign, my opponent was out there telling everyone that I was against the farmers because I was against ethanol, that I was against clean air because I was against ethanol, and that I was against all these things. It did make some impact. Well, I pointed out to that Minnesota Good Roads group that not one county commissioner, not one highway engineer, not one local elected official who is concerned about good roads in Minnesota, came to my defense.

So we have to have a two-way street. I think that if we work together, we can get the job done.

I want to thank you, and have a good flight back.

Mr. **Horsley**. I will speak to my colleagues in Minnesota about that.

Mr. **Stangeland**. I told them.

The **Chairman**. Mr. Horsley, I want to thank you for your presentation and to assure you that where you said you wanted to help, we will call on you for help. I want you to know that.

[Mr. Horsley's prepared statement and submission for the record appear beginning on page 155.]

The **Chairman**. I want to thank all of the witnesses who appeared. I think this was a good, positive hearing and it may bring some good results. I think it will. Thank all of you very, very much.

With that, the meeting stands adjourned.

[Whereupon, at 2:15 p.m., the committee was adjourned to reconvene at the call of the Chair.]

PREPARED STATEMENTS OF WITNESSES

STATEMENT BY

MAJOR GENERAL PATRICK J. KELLY,
DIRECTOR OF CIVIL WORKS
U.S. ARMY CORPS OF ENGINEERS

BEFORE THE
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
HOUSE OF REPRESENTATIVES

SECOND SESSION, 101 st CONGRESS

STATUS OF THE NATION'S INFRASTRUCTURE

MARCH 29, 1990

NOT FOR PUBLICATION
UNTIL RELEASED BY THE
HOUSE PUBLIC WORKS AND
TRANSPORTATION COMMITTEE

TESTIMONY OF
MAJOR GENERAL PATRICK J. KELLY
DIRECTOR OF CIVIL WORKS
U.S. ARMY CORPS OF ENGINEERS
BEFORE HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE

Thank you, Mr. Chairman. (Ladies and Gentleman)

I am delighted to be here and appreciate the opportunity to discuss one of our more serious domestic issues: the status of our Nation's infrastructure. Assistant Secretary Page has been personally interested in this issue and he has discussed it with various Members of Congress. I know he looks forward to working with you to assist the Nation with its infrastructure problems.

Introduction:

The purpose of my testimony today is to provide background information to the Members of the Committee by summarizing the major findings and conclusions of major studies on infrastructure which were prepared and published between 1983 and 1988. (Figure 1)

The studies assess the current (at the time of each study) state of the Nation's infrastructure and the ability of our infrastructure to meet demands of future economic growth and development. The studies present a troubling

The Nation's Infrastructure

MG Pat Kelly
Director of Civil Works
U.S. Army Corps of Engineers

Figure 1

picture of deteriorating infrastructure, the result of several decades of declining investment in our public works; however, the studies do make recommendations for financing, building and maintaining the quality of national infrastructure that will meet demands for future economic growth and development.

To introduce the subject, I would first like to state that, throughout our Nation's history, the U.S. Army Corps of Engineers has actively participated in planning, designing and constructing various aspects of such infrastructure. The Corps has been engaged primarily in construction of large multiple purpose dams, harbors and waterways, and flood control projects through its civil works programs. The Corps military missions have resulted in the construction of large military facilities, air bases and other installations including associated housing and community support systems.

While we continue this role, our major thrust is to more efficiently manage, maintain and rehabilitate the Nation's combined Army Civil Works and military infrastructure. This broad involvement in many aspects of the Nation's infrastructure has created a deep concern within the Corps for the future of both the infrastructure for which we have programmatic responsibility, as well as that of the rest of the Nation. What ever the future Federal role is to be, the Corps will be prepared to support it.

I recently established in the Civil Works Directorate a Corps Infrastructure Task Force which has the responsibility to implement an action plan as a contribution to the total national effort to address our many infrastructure needs. The plan involves maintaining and sustaining water resources energy, transportation, solid waste disposal and hazardous and toxic waste disposal in Corps mission areas under existing authorities. Much of this plan calls for building further on Corps partnerships with other agencies of government. The Corps also has an infrastructure initiative included in the President's FY 91 Budget which provides for Federal agencies with infrastructure missions to work together in the development of recommendations for a Federal strategy for addressing America's infrastructure problems. Currently, there is no integrated Federal focus on infrastructure issues and no means to evaluate and implement policy recommendations. Our FY 91 Budget initiative would establish a means to do this.

In my testimony today I will begin by providing a working definition of the term infrastructure and then proceed to review several studies that contain comprehensive reviews of the state of the Nation's public works. I will also briefly comment on current discussions and differing approaches to the importance of infrastructure to the American economy. This review will be followed by a short comparison of these studies and by some concluding remarks about future governmental and private-sector strategies for responding to our infrastructure problems.

Major Infrastructure Studies

Four major infrastructure studies were completed between 1983 and 1988. The four studies provide comprehensive overviews of the status of the Nation's infrastructure although they differ in term of years covered and what is included in the definition of infrastructure. They are:

1. America's Infrastructure - A Plan to Rebuild by Associated General Contractors of America. 1983

2. Hard Choices by the National Infrastructure Advisory Committee. 1984 (Prepared for the Joint Economic Committee Congress of the United States)

3. Public Works Infrastructure: Policy Considerations for the 1980s by the Congressional Budget Office (CBO). 1983

4. Fragile Foundations: A Report on America's Public Works. Final report to the President and Congress by the National Council on Public Works Improvement. 1988 [Prepared in accordance with the Public Works Improvement Act of 1984 (P.L. 98-501)]

Definition of Infrastructure

From these reports various concepts emerge about the meaning of the term infrastructure. Historically, the term referred to the workings of government, but has evolved to its present focus on physical structures and the services they provide.

INFRASTRUCTURE: A DEFINITION

- High Fixed Costs
- Links to Economic Development
- Long Service Life
- Public Ownership
- Interaction with Other Parts of System

Figure 2

INFRASTRUCTURE INCLUDES:

- Air, Land and Water Transportation
- Water and Sewerage Systems
- Solid and Hazardous Waste Disposal

Fragile Foundations
HARD CHOICES
A Report on the Increasing Gap Between America's Infrastructure Needs and Our Ability To Pay for Them
A STUDY
JOINT ECONOMIC COMMITTEE
CONGRESS OF THE UNITED STATES

Figure 4

For our purposes here, perhaps the best, and most readily applicable is a definition of the term infrastructure contained in the Fragile Foundations study: (I quote from the study) (Figure 2)

> Facilities with the following general characteristics - high fixed costs, strong links to economic development, long service life, interaction with other parts of a system and public ownership - may be termed 'public works infrastructure'. This definition usually includes, at a minimum, facilities for transportation, water resources, and waste management. (Figure 3)

Now that I have defined the word, infrastructure, as the community of engineers and planners currently uses the term, let me briefly discuss the findings and conclusions of the previously cited studies. Each of these studies represent complimentary, but slightly different points of view and approaches to evaluating the problem of our aging, decaying infrastructure.

America's Infrastructure - a Plan to Rebuild and Hard Choices (Figure 4)

The study, America's Infrastructure a Plan to Rebuild, completed by the Associated General Contractors of America (AGC) as well as the report Hard Choices prepared by the University of Colorado for the Joint Economic Committee (JEC) of the U.S. Congress both contain needs assessments for improving our infrastructure based on technical engineering and planning standards. --what I would call the more traditional approach. These two studies differ from later assessments which use level of performance or service criteria in evaluating infrastructure needs. The National Council on Public Works Improvement (NCPWI) points out that these earlier studies tend to emphasize structural improvements rather than lower cost operational alternatives. As a result, the first two studies concentrate on defining the gap between perceived needs and available resources and make recommendations about how to close the resulting revenue gap.

AGC Report

The AGC report was based on a survey of over 100 organizations, states and cities. It was based on a broad definition of infrastructure including such areas as low income housing and hospitals.

The Associated General Contractors of America makes a series of recommendations regarding funding to rehabilitate declining public roads and other facilities. These include:

1. Where a Federal presence in infrastructure funding (both direct and federally-assisted) is justified, such Federal funding must be adequate.

2. All levels of government must realign funding priorities. The infrastructure crisis is of such magnitude and so integral to economic revival, growth, and employment that it must take precedence over social spending.

3. The key element in infrastructure funding must be dedicated long-term funding mechanisms for all infrastructure categories. The funding must be dedicated to

avoid shifting capital investment spending, as occurred during the past 20 years. Long-term funding is recommended to provide stability to the infrastructure effort.

4. To maximize efficiency and economy in the expenditure of funds for infrastructure programs and to provide productive private sector employment, infrastructure construction must be accomplished by the private sector through the single contract method and open competitive bidding.

5. User fee funding mechanisms and enterprise authorities should be used to the maximum extent.

6. Capital budgeting should be implemented by all levels of government to assure increased infrastructure investment.

7. State Infrastructure Banks should be established with initial capitalization from both the Federal government and the states, provided the creation of the banks will result in a net increase infrastructure investment.

Hard Choices

The study, Hard Choices, evaluates the condition of the public infrastructure in 23 states, assesses infrastructure needs and estimates financial capability through the year 2000. The study addresses three broad National categories: surface transportation, water, and wastewater systems. For these categories projected for the entire country the study estimated total needs of $1,160 billion dollars (in 1982 dollars) for the years 1983 to 2000. In response to the resulting revenue gap, the National Advisory Committee appointed by the JEC to prepare the study, found:

- The problem is national in scope. It is not limited to any region or to any state;

- The problem is manageable, if public sector capacity to define needs and budget-scarce-resources is increased significantly;

- The problem requires a predictable and long-term response by the Federal government.

- For the entire country, infrastructure needs for the four categories addressed in this study are estimated to be $1,160 billion in 1982 dollars. Revenue to meet these needs is projected to be $710 billion leaving a financing gap of $450 billion.

Individual infrastructure components (e.g., water, sewer, etc.) illustrate the greatest regional variation.

- The greatest regional per capita infrastructure needs are projected for the Midwest.

- All regions expect revenue to be insufficient to meet future infrastructure demands.

- The single most dominant need across the country is highways and bridges.

- The total sewage treatment needs (in 1982 dollars) are projected to be $106 billion in the 23 states, or $163 billion nationally.

- Other transportation (i.e. , ports, airports, railroads, mass transit) is a vital infrastructure component, but one in which the private sector has traditionally played a major role.

Further the study recommended:

1. Creation of new financing mechanisms

2. A coordinated National needs assessment program with a unified capital budget evaluation

3. A review of infrastructure standards

4. An evaluation of statutory and administrative rules governing the use of existing infrastructure programs.

In addition, it based it's recommendations on state and local government enhancing their fiscal capacities.

Overall Conclusions of AGC and Hard Choices Studies

In summary, both of these studies conclude that a large dollar investment will be required to reverse the conditions of our aging bridges, roads, water systems and others. The estimates differ because of both the number of categories included and implicit assumptions about applicable standards. However, neither report provides very specific information about setting spending priorities either among or within infrastructure categories involved.

What Can be Learned from These Studies

Both the Hard Choices and AGC studies call for large investments in our infrastructure over the next few years. However, since the studies focus exclusively on structural improvement, rather than lower cost alternatives, Congress in its effort to secure more information about infrastructure needs, may only be able to utilize these reports as guidelines, at this time. The declining Federal budget and lack of monetary resources at all levels of government, indicate that the Nation may be better served by more detailed studies which would emphasize priority setting and efficient investment strategies.

Public Works Infrastructure Policy Considerations for the 1980s and Fragile Foundations

In contrast to earlier infrastructure needs and assessment reports, the study by the Congressional Budget Office (CBO) entitled, Public Works Infrastructure: Policy Considerations for the 1980s, and the Fragile Foundations study completed by the National Council on Public Works Improvement (NCPWI) do not rely on a traditional "standards" approach to calculate and determine requirements for infrastructure rehabilitation and development. These two reports represent, perhaps, a natural evolutionary outgrowth of previous work. Their focus is not on numbers, but rather on the level of service and on performance of component's of our Nation's infrastructure. In addition, these studies contain elements of strategic planning for the efficient allocation of resources in resolving critical infrastructure problems.

Public Works Infrastructure: Policy Considerations for the 1980s.

This study, prepared by the Congressional Budget Office (CBO), focuses primarily on the cost effectiveness of infrastructure investment. Investment concerns are made particularly pressing by the constraints now affecting the Federal budget. In this context the report considers: (1) how current Federal policies and funding levels may or may not mesh with infrastructure needs over the coming decades, (2) how possible policy changes can bring about improved cost effectiveness and (3) how changes at the Federal level could affect state and local governments and the private-sector beneficiaries of the infrastructure services. Included in this study are considerations of such infrastructure elements as highways, public transit, municipal water supply, wastewater treatment, water resources, traffic control, and airports. Addressing ways to correct inefficiencies stemming from current Federal policies, the CBO report recommends:

ALL GOVERNMENT SPENDING
1950 AND 1984
(IN 1984 DOLLARS)

Figure 5

- Adjusting Federal user fees both to produce a reliable measure of National needs and to correct present misalignments among users ;

- Limiting the Federal role to infrastructure investments with clear National importance; and

- Redirecting existing Federal aid to alter the current bias toward capital-intensive investment decisions.

The CBO study in addition to its more performance based approach also makes some estimates of program costs in each of the infrastructure categories it examined. The report estimates that annual capital outlays by all levels of government would have to increase from $36 billion to $53 billion between 1983 and 1990. A comparison of the financial needs estimates presented in the AGC, JEC and CBO studies is shown in Figure 5 taken from the NCPWI. Examination of these estimates based on comparable infrastructure categories indicates closer agreement than depicted.

Fragile Foundations

The final study that I will review in today's testimony has received extensive media coverage since its 1988 publication. The study, which was authorized as a result of PL 98-501 in 1984, analyzed: age and condition changes, methods to finance, trends in financing methods, maintenance needs and expenditures for improvement of public works. The study, prepared by the National Council on Public Works Improvements, is also the most extensive study

REPORT CARD ON THE NATION'S PUBLIC WORKS

Subject Category	Grade	Subject Category	Grade
Highways	C+	Water Supply	B−
Mass Transit	C−	Wastewater	C
Aviation	B−	Solid Waste	C−
Water Resources	B	Hazardous Waste	D

Source: National Council on Public Works Improvement, Fragile Foundations, February 1988.

Figure 6

undertaken. It consists of ten major published reports and over sixty commissioned background papers and special studies by some of America's foremost experts. The infrastructure components included in the report are: highways, mass transit, aviation, water resources, water supply, wastewater, solid waste and hazardous waste. The very title of this study, Fragile Foundations , conveys to some extent, the precarious nature of some components of our decaying infrastructure. It is not yet in ruins, but in many respects it is more fragile than it has been in the past and needs attention.

The Council "found convincing evidence that the quality of America's infrastructure is barely adequate to fulfill current requirements, and insufficient to meet the demands of future economic growth and development". The Council recommends "a national commitment shared by all levels of government, the private sector, and the public, to vastly improve America's infrastructure. Such a commitment could require an increase of up to 100 percent in the amount of capital the Nation invests each year in new and existing public works. In 1985, this amount was approximately $45 billion." It concludes that "If our public works were graded on an academic scale, the overall grade would be, C minus". When these grades are being considered, keep in mind that this is a subjective evaluation which took into account current as well as emerging problems. The Council went further and provided a report card (Figure 6) with a grade for each category of public works it examined. In keeping with its investment needs finding, the grades assigned were heavily weighted to economic efficiency and benefits received for costs incurred.

GOVERNMENT OUTLAYS FOR PUBLIC WORKS
CAPITAL

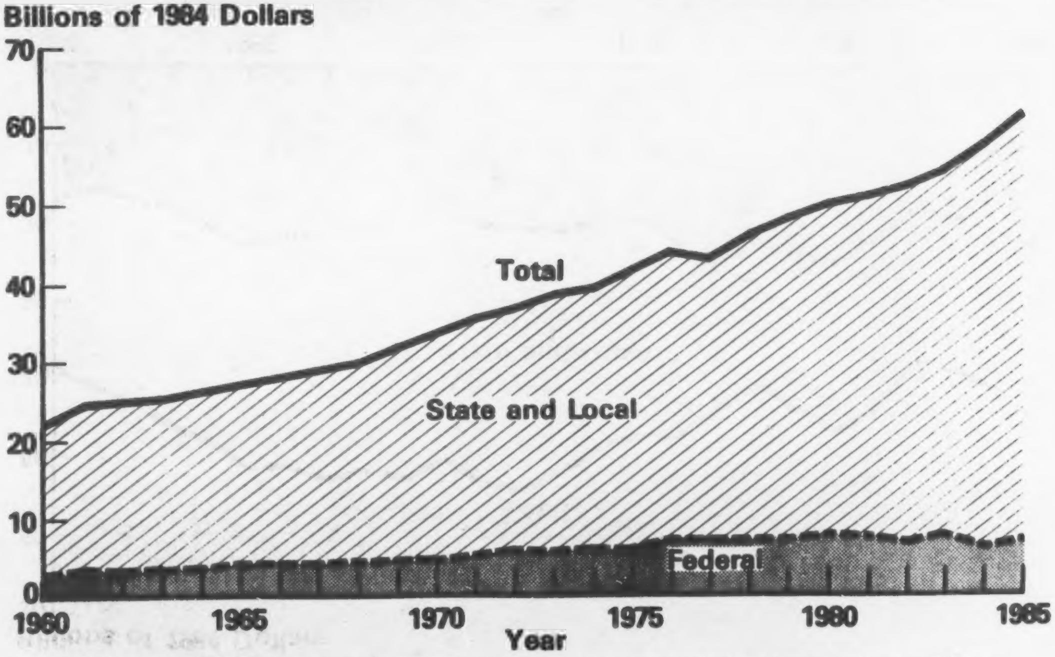
Figure 7

GOVERNMENT OUTLAYS FOR PUBLIC WORKS
OPERATIONS AND MAINTENANCE



Source: Apogee Research, Inc. based on data drawn from Historical Tables, Budget of the United States Government, 1987. Office of Management and Budget.

Figure 8

The Council also found that Public works spending patterns are of particular concern when viewed in relation to other measures of economic activity. Some of the Council's findings with respect to these relationships include:

1. Total public spending on infrastructure has dropped from 3.6 percent of the gross national product (GNP) in 1960 to 2.6 percent in 1985.

2. While spending on operations and maintenance has remained a constant share of GNP, capital spending has dropped from 2.3 percent of GNP in 1960 to 1.1 percent today.

3. The relative share of public works spending at all levels of government has declined drastically from nearly 20 percent of total expenditures in 1950 to less than 7 percent in 1984.

In addition, the pattern of spending has also changed. Capital outlay's have decreased over time, (Figure 7) but operations and maintenance spending has increased particularly at the state and local level. (Figure 8) In response to these changes in government expenditures for the Nation's infrastructure, the Council recommended:

- Clarification of the respective roles of the Federal, state, and local governments in construction and management to focus responsibility and increase accountability:

- More flexible administration of Federal and state mandates to allow cost-effective methods of compliance;

- Accelerated spending of the Federal highway, transit, aviation, and waterways trust funds;

- Financing of a larger share of the cost of public works by those who benefit from services;

- Strong incentives for maintenance of capital assets and the use of low-capital techniques such as demand management, coordinated land-use planning, and waste reduction and recycling;

- Additional support for research and development to accelerate the technological innovation and for training of public works professionals; and

- A rational capital budgeting process at all levels of government.

Overall Conclusions

The CBO and NCPWI studies both recommended strategies for dealing with the infrastructure issue. The CBO study emphasized cost-effective infrastructure investment while the broader NCPWI report focuses on services. Moreover it concluded that the quality of America's infrastructure is barely adequate to fulfill current requirements and insufficient to meet the demands of future economic growth and development. The National Council on Public Works Improvement concluded in Fragile Foundations that, unless, we enhance the capacity and performance of the Nations public works, our generation will forfeit its place in the American tradition of commitment to the future.

What Can Be Learned from the CBO and Council Studies

Of critical concern, is the complementary nature of public and private, investment in infrastructure. That is, public investment in infrastructure tends to increase productivity of private capital. The figures cited in the studies document the increasing imbalance between public and private expenditures. The imbalance is becoming more extreme because public works investment is growing more slowly than the private capital investment. With a growing imbalance, we may not be getting as much value as we could from every dollar of private investment. The Council concluded that " private and public investment must be balanced to support stable economic growth"

Other important elements for deliberation are demonstrated by these two studies. Namely, that further infrastructure studies and strategies should primarily address levels of infrastructure service and benefits-based performance of our existing systems and not rely solely on standards-based numerical estimates for future infrastructure facilities. These studies are useful because they discuss various alternatives for providing improved service and maintenance of our infrastructure.

Technology research and development is another aspect of infrastructure strategy which must be addressed. Developing and applying innovative technologies are important components of the effort to improve the Nation's infrastructure. Equally important is the need for more information about long-term costs and expected useful life of alternative technology. Unfortunately, innovation often is prevented by barriers such as: lack of consensus on priorities, fragmentation of responsibility, competition for scarce resources, public unwillingness to change, institutional reluctance to change accepted standards, fear of risk and financial liability, pressure to maintain the status quo, and the high expense associated with research and development. Attention to research and development priorities should be elevated. Mechanisms are needed to encourage coordinated research and development programs, to test results through demonstration projects, and to provide risk-sharing arrangements that would encourage innovation.

Other Theories and Proposals

Infrastructure and the level and direction of public investment continue to generate new ideas and arguments on all sides of the issue. The recent work of Dr. David A. Aschauer with the Federal Reserve Bank of Chicago has attracted considerable attention. Recent research by Dr. Aschauer shows a close relationship between the decline in public sector investment over the past 20 years and the decline in private sector productivity.

His study indicates that government spending on roads, sewers and other elements of the public infrastructure increases private productivity. Or as he

ASCHAUER THEORY: KEY POINTS

- Link between Public Investment and Nation's Productivity
- U.S. Reduction in Investment in Public Works Has Resulted in Decline in Productivity
- Public Spending for Infrastructure Stimulates Private Investment

Figure 9

says, "government should .... provide public capital in order to allow private output to prosper". (Figure 9)

Summarizing Aschauer's thesis. He believes:

- There is a strong correlation between public investment in infrastructure and a Nation's productivity.

- The U.S.'s investment in public works has declined since 1970 and so too has its productivity. Of the total U.S. productivity decline of 1.2 percentage points since 1970, a full point "can be attributed to the neglect of infrastructure".

- Public infrastructure spending drains private investment only initially. After a few years, new roads, bridges, water systems, etc. stimulate private investment, ultimately inducing a cumulative rise in the private capital stock.
- Decline in public capital spending relative to employment and private investment forces businesses to absorb higher costs and lower productivity.

- An increase in infrastructure investment brings about an increase in export growth (increases competitiveness).

Another perspective on the level and direction of public investment in the Nation's infrastructure is provided by W. David Montgomery, a Senior

MONTGOMERY THEORY: KEY POINTS

- Rely on Benefit/Cost Analysis of Individual Projects or Classes of Projects
- Spending Reflects "Changing" Investment Opportunities
- Public Investment Is Needed for Projects Not Undertaken by Private Sector
- Questions Public Investment/Productivity Linkage
- Better Pricing — Rely on User Fees

Figure 10

Economist with the Congressional Budget Office. He questions the role public infrastructure investments have played in the Nation's economic growth. His central concerns are how to shape future infrastructure spending. (Figure 10)

- How should we decide how much is enough?

- How can we insure that our infrastructure spending reflects changing investment opportunities?

- How can we get the greatest flow of service from the existing stock of public capital?

Mr. Montgomery does not believe that we can look backward at the relationship between past infrastructure investment and draw conclusions about the future level and direction of public investment. Other points include:

- Aschauer Theory (a TOP-DOWN APPROACH) gives little guidance on how public investment should change in light of dramatic changes in the economy. It would be a mistake to base infrastructure policy on such a "backward approach" (that is, relying on past economic performance to judge what should be done in the future)

- A BOTTOM-UP APPROACH makes more sense. It relies on a benefit-cost analysis to determine what individual public works projects are economically justified for public capital spending; the total spending would equal the sum of spending needed for each individual project.

- Such an approach, in addition to requiring a benefit-cost analysis, requires that projects for public capital investment should be ones that will not be undertaken by the private sector on its own.

- Another alternative to spending more is spending more wisely. One means to achieve this is through better pricing of infrastructure services by relying on user fees to ration these services in an efficient way.

Both studies offer interesting points of view.

Aschauer's and Montgomery's recent works on the value of infrastructure and applications of benefit/cost analysis further extends the work of the Council and indicates the desirability of extending study in these areas as the basis for future infrastructure development and rehabilitation. Although we in the Corps and other Federal water agencies have routinely applied benefit/cost analysis, its systematic application is less commonly used in other infrastructure categories. Wider application of benefit/cost analysis with appropriate integration of environmental protection and risk considerations could yield large dividends for future infrastructure decision-makers. Similarly, appropriate pricing policies for publicly provided services can increase economic benefits derived from use of existing infrastructure and forestall the necessity for additional investment.

Comparison of Needs

While all the above studies discuss the apparent sad state of our infrastructure and make some gross predictions of needs, definitive and specific conclusions are difficult for a number of reasons. Because of a lack of benefit-cost analysis, studies can overstate required spending since they merely reflect the cost of repairing facilities to a given engineering or other standard, regardless of whether the benefits exceed the costs involved. Some short comings of previous studies noted by the Council in its review of the literature include: (1) emphasis on capital spending,(Hard Choices and AGC study) (2) concentrations on facilities rather than services, (AGC Study), (3) estimates based on varying standards whether or not they may be inappropriate to service demands (Hard Choices). Potential criticisms of other studies are (4) lack of consideration for budget or user-pay principle constraints and (5) failure to explore potential or better rationing of present levels of infrastructure services through appropriate pricing of those services.

A Special Report on State and Local Public Works Financing and Management

An important just released study "Rebuilding the Foundations: A Special Report on State and Local Public Works Financing and Management" by the U.S. Congress Office of Technology Assessment (OTA) also provides a great deal of useful information for consideration by this committee. The report is intended as background on the State and local context for OTA's report "Rebuilding the Foundations: Public Works Technologies, Management and Financing" to be completed in the summer of 1990. The first report corroborates that "...how to pay the bills for out Nation's public works (and other government services) remains a thorny and contentious issue". It further notes, regarding local governments that "they are responsible for managing and monitoring over 70 percent of the Nations public works facilities and services. They must also comply with Federal and State standards and regulations over which they have little control" and that "The Federal Challenge is to develop standards that consider local conditions and health risks, that implement National public health and safety goals and that maintain accountability." Most significantly the report finds widespread agreement that "...public works infrastructure needs upgrading and that additional investment would benefit individuals and the national economy alike". The report focuses on what it calls three critical and controversial national issues:

- Paying the bills
- Inadequate Public Works Infrastructure
- Preserving the Environment

The OTA report concludes that:

- All levels of government will inevitably have to raise taxes or fees to cover their costs, however, or they will have to eliminate or reduce programs and services.

- ..benefit charges and earmarked taxes have proven to be relatively reliable and politically acceptable revenue sources.

FUTURE CONSIDERATIONS

- Balance Public and Private Investment
- Ways Public Works Stimulate Productivity
- Base Investment on Service and Benefit Criteria
- Encourage and Transfer Innovative Technology
- Coordinate Federal, State, Local and Private Sector Strategies

Figure 11

- It is time for the Federal and State governments to ...create a coherent, supportive management framework that includes adequate financing.

Conclusions

Based on review of the studies and proposals which I have been summarizing in this statement, a sizable gap exists between infrastructure investment and dedicated resources. While no new needs assessment studies appear at present to be required, I would suggest that in our future interagency efforts we consider the following: (Figure 11)

1. Determination of the value of infrastructure as an aid in rehabilitation and/or development decisions;

2. The role of U.S. infrastructure in international economic competitiveness;

3. The balance between private and public investment to support economic growth;

4. Benefit-cost analysis consistent with environmental safeguards and risk analysis;

5. Refinement in level of service criteria and benefits provided as guides to desireable investment levels.

6. Capital budgeting and methods of generating capital for infrastructure development and repair.

7. Methods to encourage and spread innovation and it's transfer through both proven practice and research and development.

8. Development of recommendations for a coordinated strategy at the Federal, state and local levels and within the private sector to identify workable investment and financing strategies.

Mr. Chairman, this concludes my formal statement. I will be happy to answer any questions you may have.

REBUILD·AMERICA

A·COALITION·FOR·QUALITY·INFRASTRUCTURE·INVESTMENT

STATEMENT OF

JOHN HORSLEY

CHAIRMAN, BOARD OF COMMISSIONERS

KITSAP COUNTY, WASHINGTON

on behalf of

REBUILD AMERICA COALITION

on

THE FUTURE OF OUR NATION'S INFRASTRUCTURE NEEDS

before the

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
U.S. HOUSE OF REPRESENTATIVES
RM 2167, RAYBURN HOUSE OFFICE BUILDING

March 29, 1990

GOOD MORNING. MY NAME IS JOHN HORSLEY. I AM CHAIRMAN OF THE BOARD OF COMMISSIONERS IN KITSAP COUNTY, WASHINGTON AND A FORMER PRESIDENT OF THE NATIONAL ASSOCIATION OF COUNTIES.

DURING MY TENURE AS THE PRESIDENT OF NACO, I HAD THE PRIVILEGE OF SERVING AS CHAIRMAN OF THE REBUILD AMERICA COALITION. REBUILD AMERICA IS A BROAD COALITION OF PUBLIC AND PRIVATE ORGANIZATIONS COMMITTED TO THE INFRASTRUCTURE CHALLENGE. ITS MEMBERSHIP INCLUDES LOCAL ELECTED OFFICIALS AND OTHER PUBLIC LEADERS WHOSE JOB IT IS TO MAINTAIN, INSPECT, AND PLAN FOR THE BUILDING AND REBUILDING OF OUR FACILITIES. THE COALITION IS FURTHER STRENGTHENED BY ORGANIZATIONS REPRESENTING ENGINEERS, BUILDERS, FINANCIERS, CONTRACTORS, AND ARCHITECTS WHOSE CAREERS ARE DEDICATED TO THE HIGHEST STANDARDS OF QUALITY, SAFETY, AND COST EFFECTIVENESS.

I WOULD LIKE TO BEGIN MY TESTIMONY BY INTRODUCING A SHORT VIDEO PRODUCED BY THE COMMITTEE STAFF USING THE VIDEO RESOURCES OF THE REBUILD AMERICA COALITION. WHILE THE MEMBERS OF REBUILD AMERICA COALITION ARE PROUD OF THE INDIVIDUAL AND ORGANIZATIONAL CONTRIBUTIONS TO BUILDING ONE OF THE MOST COMPLEX INFRASTRUCTURE SYSTEMS IN THE WORLD, WE MUST BE KEENLY AWARE OF THE SIGNIFICANT CONSEQUENCES OF DISINVESTMENT AND ITS FUTURE EFFECT ON OUR QUALITY OF LIFE.

(VIDEO - 12 MINUTES)

MR. CHAIRMAN, I COMMEND YOU FOR HOLDING THESE IMPORTANT HEARINGS ON OUR NATION'S INFRASTRUCTURE.

OUR COUNTRY IS AT AN EXTRAORDINARY TURNING POINT. THE COLD WAR, WHICH HAS DOMINATED BOTH NATIONAL AND INTERNATIONAL PRIORITIES FOR GENERATIONS, IS FADING. THIS CHANGE OFFERS OUR NATION AN OPPORTUNITY TO RE-EXAMINE OUR PRIORITIES FOR BUDGETING AT THE NATIONAL LEVEL.

MR. CHAIRMAN, NOW IS THE TIME FOR THE PRESIDENT AND THE CONGRESS TO REFOCUS THE NATION'S RESOURCES, STRENGTH, AND IMAGINATION ON REBUILDING AMERICA.

AS POLITICAL AND SOCIAL CHANGES SWEEP AROUND THE GLOBE, WE ALSO BELIEVE THAT OUR WILLINGNESS TO INVEST PRODUCTIVELY IN THE NATION'S PUBLIC INFRASTRUCTURE -- TO INVEST IN OUR FUTURE -- IS CRITICAL TO OUR ABILITY TO COMPETE IN AN INTERNATIONAL ECONOMY.

AS YOU HAVE HEARD FROM EARLIER TESTIMONY, THE INFRASTRUCTURE NEEDS OF THIS NATION ARE SUBSTANTIAL, AND WELL DOCUMENTED.

IN THE PACKETS BEFORE YOU, WE HAVE PROVIDED SOME OF THE COALITION'S PUBLICATIONS THAT CONSOLIDATE MUCH OF THE NEEDS ASSESSMENTS THAT HAVE BEEN UNDERTAKEN. YOU WILL ALSO FIND A STATE BY STATE FACT SHEET ON INFRASTRUCTURE NEEDS.

AT THIS TIME, I WOULD LIKE TO HIGHLIGHT A FEW POINTS ABOUT THE NEEDS AND THEN BRIEFLY OFFER SOME RECOMMENDATIONS TO MEET THESE GROWING NEEDS.

AMERICA'S INFRASTRUCTURE IS NOT ONLY DETERIORATING DUE TO AGING FACILITIES, BUT UNDERINVESTMENT IN NEW FACILITIES IS OVERBURDENING CURRENT DEMANDS. A QUICK LOOK AT SOME OF THE MAJOR COMPONENTS OF THE INFRASTRUCTURE SYSTEM REVEALS THE UNRAVELING FABRIC OF THIS VITAL FOUNDATION:

- THE AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS ESTIMATED AN ANNUAL CAPITAL INVESTMENT REQUIREMENT OF $58.5 BILLION IS NEEDED TO MEET FUTURE HIGHWAY TRANSPORTATION NEEDS. THIS COMPARES WITH CURRENT ANNUAL EXPENDITURES BY ALL LEVELS OF GOVERNMENT OF $31.0 BILLION;

- OVER 41 PERCENT OF THE 577,710 BRIDGES IN THE 1988 NATIONAL BRIDGE INVENTORY ARE EITHER STRUCTURALLY DEFICIENT OR FUNCTIONALLY OBSOLETE. THE FEDERAL HIGHWAY ADMINISTRATION ESTIMATES THAT BETWEEN NOW AND THE YEAR 2005, A $93 BILLION INVESTMENT WILL BE NEEDED.

- THE SITUATION FACING OUR NATION'S OVERBURDENDED AIRPORT AND AIRWAY SYSTEM IS BECOMING CRITICAL. ACCORDING TO THE FAA, MORE THAN 696 MILLION PASSENGERS ARE EXPECTED TO FLY ON COMMERCIAL AIRLINES EACH YEAR BY 1998. THIS REPRESENTS A 70 PERCENT INCREASE FROM THE 409 MILLION PASSENGERS WHICH THE FAA ESTIMATES FLEW ON COMMERCIAL AIRLINES IN FY 1986;

- MASS TRANSIT HAS SEEN A 50% REDUCTION OF FEDERAL SPENDING IN REAL TERMS OVER THE LAST TEN YEARS. THE AMERICAN PUBLIC TRANSIT ASSOCIATION REPORTS THAT A DOUBLING OF FEDERAL INVESTMENT IS NECESSARY TO RESTORE RECENT DECLINES IN THE PURCHASING POWER OF SUCH ASSISTANCE AS A RESULT OF INFLATION AND PROGRAM REDUCTIONS SINCE 1981.

- THE ENVIRONMENT PROTECTION AGENCY ESTIMATES THAT 10,835 WASTEWATER FACILITIES HAVE DOCUMENTED WATER-QUALITY OR PUBLIC HEALTH PROBLEMS. WASTEWATER TREATMENT PLANT CONSTRUCTION TO MEET THE NEEDS OF THE POPULATION IN 2008 WILL REQUIRE AN ADDITIONAL INVESTMENT OF $83.5 BILLION.

WE ARE ENCOURAGED THAT THE BUSH ADMINISTRATION HAS RECOGNIZED THE NECESSITY OF A NATIONAL TRANSPORTATION STRATEGY FOR THE 1990's AND BEYOND. THE NEW POLICY ACKNOWLEDGES THE NEED FOR ATTENTION TO OUR AGING TRANSPORTATION INFRASTRUCTURE.

AS A LOCAL ELECTED OFFICIAL, HOWEVER, I AM DISTURBED AT THE STRATEGY'S GOAL OF SHIFTING THE FINANCIAL RESPONSIBILITY OF AMERICA'S TRANSPORTATION INFRASTRUCTURE TO STATE AND LOCAL GOVERNMENTS. THIS REPRESENTS A FURTHER EROSION OF THE FEDERAL FINANCIAL RESPONSIBILITY. WE NEED TO GET OUR NATIONAL TRANSPORTATION POLICY TOGETHER AND IN GEAR, AND FROM OUR PERSPECTIVE, SOME OF THE GEARS ARE STILL CLASHING HERE IN WASHINGTON.

ALONG WITH THE RELEASE OF A TRANSPORTATION STRATEGY, THIS ADMINISTRATION HAS MADE A CLEAN AND HEALTHY ENVIRONMENT AN INTEGRAL PART OF ITS DOMESTIC POLICIES.

NEW FEDERAL REQUIREMENTS FOR PUBLIC WORKS ARE BEING IMPOSED THAT AFFECT DRINKING WATER QUALITY, SOLID WASTE DISPOSAL AND WASTEWATER TREATMENT JUST AS EPA CONSTRUCTION GRANT ASSISTANCE IS BEING PHASED OUT. ACCORDING TO THE RECENTLY RELEASED OFFICE OF TECHNOLOGY ASSESSMENT (OTA) REPORT, A STRONG CASE CAN BE MADE FOR A DEDICATED FEDERAL FUND TO ASSIST STATES IN SUPPORTING LOCAL EFFORTS TO COMPLY WITH NEW ENVIRONMENTAL REQUIREMENTS. LACKING SUCH SUPPORT, ACCORDING TO OTA, MANY AREAS ARE LIKELY TO FALL INTO NONCOMPLIANCE.

MEETING THESE CHALLENGES REQUIRES THAT WE CRITICALLY REEVALUATE THE PERSPECTIVES AND PRACTICES THAT GUIDED TRANSPORTATION AND ECONOMIC DEVELOPMENT DECISIONS OVER THE PAST TWO DECADES, AND SEEK BROAD AGREEMENT ON HOW TO GENERATE FUNDS FROM ALL LEVELS OF GOVERNMENT AND THE PRIVATE SECTOR.

EXPENDITURE OF THE TRANSPORTATION TRUST FUNDS

IN THE FORM OF GASOLINE TAXES AND THE TICKET TAX ON AIR TRAVEL TO BE MAINTAINED BY THE FEDERAL GOVERNMENT IN DEDICATED TRUST FUNDS. CURRENTLY, ABOUT $28.8 BILLION REMAINS UNSPENT IN THE HIGHWAY, MASS TRANSIT AND AVIATION TRUST FUNDS WHILE AMERICANS COOL THEIR COLLECTIVE HEELS ON AIRPORT RUNWAYS AND IN CONGESTED TRAFFIC.

AN INCREASE IN FUNDING FOR THE FEDERAL HIGHWAY PROGRAM TO $15 BILLION, APPROXIMATELY $2.7 BILLION ABOVE THE CURRENT YEAR LEVEL, CAN BE ACCOMPLISHED WITHOUT A TAX INCREASE. THE EXTRA FUNDS WILL BE AVAILABLE IN THE HIGHWAY TRUST FUND BY SIMPLY USING THIS YEAR'S RECEIPTS PLUS THE INTEREST GENERATED FROM THE ACCUMULATED BALANCE IN THE TRUST FUND. THE EFFECT ON OUTLAYS WILL BE MINIMAL IN FY 1991 AS SPENDOUT FOR THE HIGHWAY PROGRAM IS SLOW.

WE URGE THIS COMMITTEE TO CONTINUE ITS LEADERSHIP ROLE IN SUPPORTING THE USER FEE CONCEPT FOR TRANSPORTATION AND TO ASSURE THAT THESE FUNDS ARE FULLY EXPENDED FOR THE PURPOSES THEY ARE COLLECTED.

TAX EXEMPT MUNICIPAL BONDS

CAPITAL INVESTMENTS AT THE STATE AND LOCAL LEVEL HAVE BEEN AND ARE FUNDED LARGELY THROUGH THE USE OF MUNICIPAL BONDS. OVER THE PAST EIGHT YEARS, HOWEVER, THE TAX CODE HAS BEEN REVISED NO LESS THAN SIX TIMES. EVERY TIME THE TAX CODE HAS BEEN "REFORMED", THE ABILITY OF STATE AND LOCAL GOVERNMENTS TO MEET THE INFRASTRUCTURE NEEDS OF OUR NATION HAS BEEN FURTHER CURTAILED.

EACH AND EVERY ENCROACHMENT HAS SIMPLY INCREASED THE COST OF BUILDING, MAINTAINING, AND REBUILDING HOUSING, STREETS, AIRPORTS, BRIDGES, WASTEWATER FACILITIES AND OTHER PUBLIC CAPITAL FACILITIES. THE SO-CALLED REFORMS HAVE NOT ONLY LIMITED STATE AND MUNICAPL AUTHORTY TO ISSUE CAPTIAL FINANCING, BUT HAVE SEVERELY ERODED THE POTENTIAL MARKETS FOR SELLING OUR BONDS.

FURTHERMORE, IN ADDITION TO THESE FEDERAL TAX CODE REVISIONS, THERE ARE LIMITS SET BY STATE LAW, STATE CONSTITUTIONS AND CITIZEN INITIATIVES WHICH RESTRICT LOCAL GOVERNMENTS' ABILITY TO RAISE REVENUES.

LOCAL GOVERNMENTS HAVE INCREASED THEIR OWN REVENUES BY RAISING LOCAL TAXES AND INITIATING OR INCREASING USER FEES. THESE RESOURCES ALONE CANNOT MEET THE NATION'S INFRASTRUCTURE NEEDS.

FEDERAL INFRASTRUCTURE SPENDING REPORTING

A PROPOSAL ADOPTED BY NACO -- AND AN IDEA I HOPE TO BRING BEFORE THE REBUILD AMERICA COALITION AT THEIR NEXT MEETING -- IS THE SUPPORT FOR LEGISLATION WHICH WOULD SET AN ANNUAL NATIONAL GOAL FOR INFRASTRUCTURE INVESTMENT BASED ON PROJECTED NEEDS. A YEARLY REPORT WOULD THEN BE ISSUED ON THE STATUS OF THE ATTAINMENT OF THAT GOAL AND SUCH REPORT WOULD REFLECT THE FEDERAL, STATE, AND LOCAL GOVERNMENTS' INVESTMENT IN INFRASTRUCTURE.

BY REQUIRING THIS REPORT, THE CITIZENS OF THIS COUNTRY CAN ACCURATELY ASSESS IF ADEQUATE INVESTMENTS ARE BEING MADE TO IMPROVE THEIR QUALITY OF LIFE THROUGH INFRASTRUCTURE SPENDING.

I WOULD ALSO LIKE TO SHARE WITH THE COMMITTEE A WORKBOOK PUBLISHED BY NACO AND THE NATIONAL ASSOCIATION OF HOMEBUILDERS, TITLED, "BUILDING TOGETHER, INVESTING IN COMMUNITY INFRASTRUCTURE." THE WORKBOOK OUTLINES A PROCESS THROUGH WHICH MEMBERS OF THE COMMUNITY CAN WORK TOGETHER TO FIND SOLUTIONS TO THEIR INFRASTRUCTURE NEEDS. THE BOOK WAS RELEASED IN JANUARY AND MANY COMMUNITIES ARE NOW STARTING THE PROCESS.

IN SUMMARY, MR. CHAIRMAN, THE REBUILD AMERICA COALITION HAS DEVELOPED A FIVE POINT CONSENSUS LEGISLATIVE PROGRAM TO MAINTAIN AND EXPAND OUR NATION'S INFRASTRUCTURE:

1) THERE SHOULD BE NO FURTHER FUNDING REDUCTIONS IN EXISTING FEDERAL PROGRAMS THAT ADDRESS INFRASTRUCTURE NEEDS;

2) THE EXISTING FEDERAL INFRASTRUCTURE TRUST FUNDS MUST BE CONTINUED, ADEQUATELY FUNDED, AND FULLY EXPENDED FOR THEIR INTENDED PURPOSES;

3) FEDERAL RESTRICTIONS ON THE USE OF TAX EXEMPT FINANCING FOR INFRASTRUCTURE PURPOSE SHOULD BE ELIMINATED;

4) A FEDERAL CAPITAL INFRASTRUCTURE PROGRAM SHOULD BE CREATED TO PROVIDE ASSISTANCE TO STATES AND LOCALITIES IN MEETING INFRASTRUCTURE NEEDS;

5) A FEDERAL LONG-TERM MULTI-YEAR CAPITAL BUDGET SHOULD BE ESTABLISHED.

THANK YOU MR. CHAIRMAN.

AMERICA'S INFRASTRUCTURE: PRESERVING OUR QUALITY OF LIFE

REBUILD·AMERICA

A•COALITION•FOR•QUALITY•INFRASTRUCTURE•INVESTMENT

REBUILD·AMERICA

A•COALITION•FOR•QUALITY•INFRASTRUCTURE•INVESTMENT

This report is the second in a series of reports that addresses various elements of America's infrastructure problems and solutions to these problems. Copies of the Rebuild America Coalition's first report, *(Making America's Economy Competitive Again)*, are available from the Rebuild America Coalition secretariat.

The Rebuild America Coalition is composed of private and public sector organizations who have recognized the need to protect the nation's investment in its entire range of public facilities. . . America's infrastructure.

Participation in the Rebuild America Coalition does not oblige any of the individual member organizations to support or endorse the infrastructure policies of the other coalition members.

AMERICA'S INFRASTRUCTURE: PRESERVING OUR QUALITY OF LIFE

American history has shown that the very essence of the American experience is a striving to make a better life, to build, and to leave behind more than we found when we arrived. In recent years, not only have Americans sought an ever higher standard of living, making their children's lives better than their own, they have also become intensely concerned over the quality of that life.

Economist William Baumol of Princeton University has stated that:

> Although the term 'quality of life' eludes precise definition, we normally use it to refer to more than just the state of the natural environment. In addition to the cleanliness of our air and water and the condition of forest and field, the quality of life in our highly urbanized society depends critically on a wide range of amenities. Urban sprawl, decaying neighborhoods, and frustrating congestion become fully as important as the degradation of beautiful canyons or the extinction of animal species.

Our quality of life is ensured not just by what we as individuals do, but also by the concerted actions of our community to create and preserve the qualities we admire in our natural and in our built environment. Mayor Terry Goddard of Phoenix, President of the National League of Cities, has said that "Since most Americans live in cities or towns, our quality of life (or lack thereof) is most impacted by city government. Collectively, cities are the basis of American productivity; if our cities are successful in providing high quality services, this country has a chance to meet the challenge of foreign competition. When cities work, America works."

Only through investing in our nation's infrastructure—the roads, bridges, airports, educational and public buildings, water supply and wastewater treatment facilities, and solid waste disposal facilities that form the backbone of our communities—can we as a nation make sure that the quality of life so valued by this generation will be in place for future generations.

Yet, for the past two decades America has been neglecting these same public works. Capital spending on public works investment dropped from 2.3 percent of the gross national product in 1960 to less than 1.1 percent in 1985. The United States now ranks fifty-fifth in the world in capital investment in infrastructure.

This results in congestion and increasing frustration with the way our communities function. But just as important, the American standard of living is put in jeopardy as well. A Massachusetts Institute of Technology blue ribbon panel, The Commission on Industrial Productivity, noted in the recent book *Made in America* that "To live well, a nation must produce well. In recent years many observers have charged that American industry is not producing as well as it ought to produce, or as well as it used to produce. If the charges are true and if the trend cannot be reversed, then sooner or later the American standard of living must pay the penalty."

To provide for a higher level of productive economic performance in the future, the MIT Commission recommends that the nation focus on four major kinds of investment—basic education and literacy, long-term business strategies, policies that stimulate productive private investment, and **investment in infrastructure for productive performance**.

It is now widely recognized that the condition of America's infrastructure is at a crisis stage, endangering the public safety, lowering U.S. economic competitiveness, and diminishing the overall quality of life. But the current situation won't even approach the critical nature of the future crisis if remedial actions are not taken now. America's population is expected to increase by forty-four million people over the next thirty years, adding even more pressure to already overburdened public works facilities.

What has caused this decline in infrastructure investment, and consequently, in our quality of life? Since 1970, the American economy has created jobs at a rate twice that of population growth. Metropolitan areas now account for three-quarters of the total U.S. population, with more than forty percent of America living in the suburbs. Nearly ninety percent of the growth during the eighties has been in metropolitan areas.

At the same time, the relationships between federal, state and local governments have been undergoing some major changes during the 1980s. The federal budget deficit, as well as a philosophical view during the Reagan Presidency that more responsibility should shift to the state and local level, has resulted in the termination or reduced funding of many programs that had financed infrastructure projects. The federal share of infrastructure spending for fixed capital formation declined from 41 percent in 1981 to 34.5 percent in 1986. From 1980 through 1987, federal aid to states and cities declined 37 percent in real terms (adjusted for inflation).

The federal government has also enacted mandates and regulatory programs for states and localities to enforce while restricting the resources available to fund these programs. This situation has led Governor Blanchard of Michigan to state that "Washington has gone from revenue sharing to revenue bleeding." The federal government, confronting budget deficits of its own, also terminated its revenue sharing program with the states but continues to order up programs for the states to implement.

In America, 83,216 state, county and municipal governments, as well as special districts and school districts, share responsibility with the federal government for providing the public works that form the nation's infrastructure. Where one federal program, revenue sharing, satisfied many needs, now thousands of governments at all levels must take action to fill the gaps created. "Obviously, . . ." Mayor George Latimer of St. Paul has written, "we need to approach our problems differently. We need to approach them in a way that is new, up-to-date and realistic, but one which is rooted in traditional American values and acknowledges the limited level of resources available."

The general revenue sharing program, which returned $4 billion to local governments, was abolished in 1986. Programs providing funding for rural America have been cut by over 67 percent since 1980. Secondary highway systems lost over 60 percent of funding, the Farmers Home Administration water and wastewater disposal grants lost 75 percent, the Environmental Protection Agency's construction grants program was cut by three-quarters, and Community Development Block Grants lost one-third of funding.

Even some of our most vital infrastructure programs are being held hostage to the federal budget deficit. Users of the nation's transportation systems contribute user fees in the form of gasoline taxes and the ticket tax on air travel to be maintained by the federal government in dedicated trust funds. The proceeds of these transportation trust funds can only be spent for these surface and aviation transportation programs. When the federal government does not invest all the money that is collected for pressing highway and airport needs, a balance mounts in the federal Treasury which is used to reduce borrowing needs to finance other federal programs. Currently, about $28.8 billion remains unspent in these two funds while Americans cool their collective heels on airport runways and in traffic jams.

The funding crisis in the capital programs of state and local governments is easily seen when specific cities are examined. For example, New Orleans received $89 million in 1984 in federal and state aid. In 1988, the city only received $22 million. In fact, eight percent of general purpose local governments in the U.S. now receive no federal funding at all. A survey of City Fiscal Conditions in 1989 by the National League of Cities found that in response to budgetary pressures, 36 percent of municipalities reduced capital spending this year. A majority of the cities cited loss of federal funding, particularly revenue sharing, as the major reason causing them to cut infrastructure spending.

What remains as the most stable method of raising money for public investment is state and local government borrowing. The primary vehicle for such borrowing is the tax-exempt municipal bond. Municipal bonds have traditionally been a staple of state and local project finance. The exemption from federal taxes on municipal bonds allows state and local governments to finance their public projects at much lower interest rates than those available to private corporations.

In addition, borrowing allows state and local governments to spread the costs of their investments over time, as benefits from the investments accrue. In 1986 borrowing accounted for 50 percent of all state and local capital investment. Moreover, public approval for this kind of borrowing is high. In the 1980s over 74 percent of the bonding authority requested by state and local government through bond referendums has been approved by voters. Clearly, voters understand the importance of public investment to address infrastructure needs, and the need for states and localities to borrow to finance this investment.

AMERICAN PUBLIC SAYS "YES" ON BOND ISSUES

Year	Percent Volume Approved	Total Volume Approved*	Total Volume Voted On
1989 **	70.1%	$ 4,510.0	$ 6,433.7
1988	80.7%	$ 21,130.0	$ 26,183.4
1987	73.3%	$ 8,480.0	$ 11,566.9
1986	82.7%	$ 13,370.0	$ 16,166.9
1985	83.2%	$ 9,160.0	$ 11,009.6
1984	81.0%	$ 10,630.0	$ 13,123.5
1983	61.1%	$ 7,160.0	$ 1,171.5
1982	83.2%	$ 8,890.0	$ 10,685.1
1981	57.2%	$ 5,030.0	$ 8,793.7
1980	71.0%	$ 6,280.0	$ 8,971.4

Note: Voter turnout is lighter in non-election years, making bond issues more difficult to pass.

Source: The Bond Buyer

Unfortunately, federal policy-makers in the mid-1980's seemed less favorably inclined to state and local borrowing. Over the last decade the federal government has taken steps to limit the scope of tax-exempt borrowing through a variety of means. On the supply side, private participation in projects financed by tax-exempt bonds has been limited, reducing the scope of public-private partnerships. The volume of tax-exempt bonds issued for certain purposes has also been restricted. Moreover, the federal government has limited the ability of state and local governments to earn money on borrowed funds while these funds are idle, pending expenditures on public projects. Prior to the imposition of these limits, state and local governments used investment earnings to reduce the cost of their projects. All of these measures have limited the ability of states and localities to finance important public projects with tax-exempt bonds.

Equally important is that steps have been taken to limit the attractiveness of municipal bonds to investors. Subjecting certain types of otherwise tax-exempt municipal bonds to the alternative minimum tax weakens the demand for these bonds by property and casualty insurance companies, the major corporate investor in bonds. Furthermore, banks have essentially been eliminated as investors in most kinds of long-term municipal bonds through the elimination of their ability to deduct the cost of carrying these bonds. These restrictions on demand mean that state and local governments must pay higher interest rates to attract investors for their bonds. Higher interest rates, of course, increase the costs associated with financing public projects.

Postponing action on infrastructure investment also leads to increasing costs. Not only do facilities continue to deteriorate, but a four percent rate of inflation would mean that a 60 percent increase in funds would be needed by the year 2000 just to have the same buying power.

If the costs of delay are prohibitive, the benefits of taking action now are enormous. David Aschauer, a senior economist at the Federal Reserve Bank of Chicago, says that "Raising the level of public investment spending from its current abysmal level of less than one-half of one percent of GNP to a modest 2 percent—some $80–90 billion dollars per year—would work wonders." Dr. Aschauer bases his conclusions on research demonstrating a relationship between public investment and productivity in the major industrialized countries.

In a recent article, Dr. Aschauer concludes that "an increase in the level of public investment by one percent of gross output yields a gain in productive growth of about 0.4 percent per year." In earlier articles, Aschauer points to differing rates of productivity growth in the major industrialized countries. The clear implication of Aschauer's work is that the United States can take positive action to improve its economic fortunes through a policy of increased public investment.

A closer look at each area of our nation's infrastructure reveals the threat to our quality of life and our standard of living on each front. The costs of repair

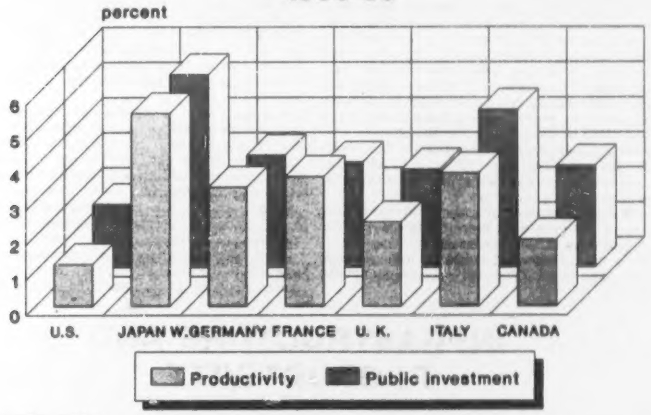
Years

SOURCE: BUREAU OF LABOR STATISTICS

The growth rate each year in public capital stock measures infrastructure investment; the growth rate of productivity in the economy is measured by the annual growth rate of total factor productivity.

"GROUP OF SEVEN" COUNTRIES
1960-86



SOURCE: OECD

Productivity is the average annual growth rate in total factor productivity from 1960-1986; public investment is the average annual increase over the last 25 years in public facilities.

and meeting the needs of growth are high, but are clearly justified in every area. The infrastructure needs described fall into two interrelated major concerns—ensuring a clean, safe environment and providing an efficient transportation network.

QUALITY OF LIFE: A CLEAN, SAFE ENVIRONMENT

A clean, safe environment is central to the concept of 'quality of life.' The evidence shows incontrovertibly that the real cost of pollution is high. At the least, water pollution damages aquatic life and interferes with commercial fishing. The availability of a ready supply of clean drinking water is basic to society as we know it. Protection from the harmful impact hazardous waste can have on our communities is also expected from our government.

Business Week (August 21, 1989) examined new methodologies being developed by economists to assess the importance of the environment, concluding that "Economists are coming up with numbers that show that people put an extraordinarily high value on preserving an unspoiled environment. And even if the methods aren't perfect, being able to place a value on the wonders of nature will make paying for a clean environment less onerous."

Public buildings also play a central role in ensuring a safe and healthy community. As important as the natural environment is, communities rely on their schools, their courts, their fire stations, their hospitals, and their prisons to provide the backbone of civilized society. Much higher levels of investment are required to rebuild the vertical infrastructure, such as asbestos removal in many of the nation's older school buildings, and provide additional capacity, as in the need to build many additional prisons to meet court orders.

CLEAN WATER

Cleaning up the nation's polluted rivers, bays and streams to preserve the environment for fishing and recreational uses continues to be a priority demanded by the nation's citizens. Since signing of the Water Quality Act of 1965, over $60 billion of federal funds have been spent cleaning up the nation's waterways. The quality of some 47,000 miles of monitored streams has markedly improved as a result. In Lake Erie—pronounced biologically dead 15 years ago—perch, walleye, and even largemouth bass and coho salmon are thriving. Trout have returned to the Hudson River near New York City.

According to the Environmental Protection Agency's National Water Quality Inventory Report, substantial reductions have occurred in pollutants. Sewage treatment plants are removing about 13,600 tons per day of the two principal conventional pollutants—suspended solids and Biological Oxygen Demand—an increase of 65 percent over 1973 levels.

But elsewhere, 311,000 miles of water have worsened or remain unchanged. The Environmental Protection Agency compiles a biannual survey of the cost of constructing publicly-owned wastewater treatment works necessary to meet the goals of the Clean Water Act. Included in the survey are estimates for all types of required changes to wastewater facilities, such as the construction of entirely new facilities, and enlarging, upgrading, abandoning and replacing existing facilities.

EPA estimates that 10,835 facilities (of a total 15,591) have documented water-quality or public-health problems. Existing facilities are considered for replacement when they have reached the end of their design life and are no longer able to operate satisfactorily.

The 1988 Needs Survey identifies "current needs" for facilities to meet wastewater treatment needs of the U.S. population on January 1, 1988. The survey also provides a projection of "design year needs"—the facilities that will be required to adequately protect the environment by providing the wastewater treatment required for a projectedpopulation in the year 2008.

Wastewater treatment plant construction to meet the needs of the population in 2008 will require an additional investment of $83.5 billion. These needs fall into seven categories:

Secondary Treatment—$26.8 billion
Advanced Treatment—$5.0 billion
Infiltration/Inflow Correction—$2.9 billion
Replacement/Rehabilitation—$3.7 billion
New Collector Sewers—$13.8 billion
New Interceptor Sewers—$14.9 billion
Combined Sewer Overflows—$16.4 billion

However, the EPA has estimated that 400 cities and towns will be unable to meet the deadlines set by the Clean Water Act for their secondary treatment facilities. Of the rivers and streams in the United States that do not meet their state water quality standards, 17 percent are failing because of pollution from inadequate wastewater treatment. Of U.S. estuaries, 22 percent are not meeting their standards because of needed wastewater plant construction.

Eighty-seven percent of all publicly-owned sewage treatment plants in the country provide secondary or better treatment for 95 percent of the nation's sewage. Secondary treatment protects communities from the disease potential of untreated human waste and removes materials that can rob waters of oxygen necessary for aquatic life.

When the Clean Water Act was reauthorized, only a $2.4 billion annual funding level was provided toward meeting these $83.5 billion future needs. Additional funds are being raised at the state and local level, although constrained by changes in the laws governing tax-exempt bonds. New York, California, Florida, Massachusetts, and Texas show the largest construction needs to meet clean water targets.

A separate survey conducted by the Association of State and Interstate Water Pollution Control Administrators summarizes the 7,590 identified municipal wastewater treatment projects that will be necessary to first bring communities into compliance with the Clean Water Act, and then keep them in compliance over the next five years as population increases.

SAFE DRINKING WATER

Rising environmental and public health concerns led to new federal requirements for filtration, disinfection, and lead removal from drinking water mandated by the five-year reauthorization of the Safe Drinking Water Act Amendments (SDA) of 1986. This law applies to all 210,000 public water systems in the nation, including any system that serves 25 or more people or has 15 or more service connections. Almost 40,000 U.S. water systems were out of compliance with the more lenient, pre-1986 requirements.

EPA's ground water supply survey in 1983 found that about 28 percent of randomly selected large municipal water systems (serving more than 10,000 people) had detectable levels of one or more volatile organic chemicals in their ground-water supplies. The agency found that water from 45 percent of large public water systems relying on groundwater had detectable levels of volatile organic chemicals. Forty-two million Americans are exposed to potentially harmful levels of lead in their drinking water.

The Environmental Protection Agency estimates that the cost to localities of meeting these new drinking water mandates is up to $3 billion annually. The Safe Drinking Water Act Amendments provide some $55 million over four years for matching grants to states to establish wellhead protection programs. Otherwise, there has been no federal program to provide funding for drinking water systems, and existing financing mechanisms have not been able to meet growing needs.

Perhaps more importantly, many construction needs stem from the need to repair and replace deteriorating systems. A 1986 study by the Congressional Budget Office estimated that water supply needs over the next twenty years will range between $3.6 billion and $5.4

Sources: Association of State and Interstate Water Pollution Control Administrators; U.S. Environmental Protection Agency billion per year. These needs include the replacement and expansion of distribution systems, and the replacement and expansion of treatment facilities, primarily needed in small systems. These figures are almost evenly divided between deferred maintenance and replacement needs, and new growth needs.

While aged pipes are not inherently a problem, many need in-place cleaning and lining. Old pipes frequently leak, not only losing fresh water but creating water pressure problems. In 1977, the City of Boston could only account for 50 percent of its water after distribution. The city adapted a metering program, and is now spending $64 million to replace or line all mains more than 100 years of age, or approximately 15 percent of its 1000 mile system.

New York City alone is looking at a $7.5 billion upgrade to its water supply system. In suburban Los Angeles, the Metropolitan Water District, which supervises 27 different Southern California Water Agencies, plans to spend $3 billion for new water facilities over the next 20 years.

A survey conducted by the American Water Works Association projects that currently the industry is spending $4 billion annually, broken down as follows:

- 19% for preventing water source degradation
- 6 % for pumping facilities
- 20 % for treatment facilities
- 43 % for distribution systems (restoration)
- 6 % for storage restoration
- 6 % for general property

The average annual requirement for capital spending has been estimated by the American Water Works Association to be somewhere between $5 and $10 billion. EPA has placed national costs at roughly $56 billion for capital construction over 10 years.

Much of this estimated annual requirement will fall on the thousands of small utilities which need new treatment facilities to ensure that their consumers obtain the same quality drinking water as the rest of the nation. Obtaining capital investment funds is difficult for many of these small systems; many small utilities will need special assistance to achieve safe drinking water standards. At the state level, the Commonwealth of Pennsylvania's Water Facilities Restoration Act is one independent water loan program that addresses this problem.

The provision of adequate water supply is vital not only to individuals, but to industry as well. According to Census data, total estimated water use for manufacturing totalled 10.42 trillion gallons in 1983. More than 80 percent of usage was accounted for by four major industries: chemical and applied products, primary metals, paper and allied products, and petroleum and coal products.

SOLID WASTE DISPOSAL

The nightly news told the story—a barge filled to overflowing with 90 tons of garbage from the northeastern U.S. travelled for several months in the Caribbean and Gulf of Mexico as its operators searched for a place to dispose of the cargo. Suddenly a less obvious aspect of the nation's infrastructure crisis moved toward center stage.

Estimates are that 450,000 tons of waste are being generated every day, 95 percent of which are being disposed of in landfills that are rapidly reaching the end of their disposal capacity. The annual U.S. generation of 158 million tons of municipal solid waste would fill a convoy of 10-ton garbage trucks, 145,000 miles long, over half way from here to the moon. The problem is still growing—EPA estimates that with our current garbage practices, the annual solid waste total could reach 193 million tons by the year 2000.

Each man, woman, and child contributes an average of 1,300 pounds a year to the growing mountain of garbage. In 1960, Americans generated waste at a rate of 2.65 pounds per person per day; by 1986, that figure had jumped to 3.58 pounds. More than 40 percent of this solid waste stream consists of the paper and paper products discarded in homes, offices and factories.

A recent EPA study reveals that roughly eighty percent of the municipal solid waste discarded each year in the U.S. is disposed of in the approximately 6,000 solid waste landfills currently in operation in this country. One-third to one-half of these facilities are expected to exhaust their disposal capacity and close by the year 1993.

Many existing facilities are closing as well because their design and operation do not meet Federal or State standards for the protection of human health and the environment. New facilities must be built to replace this diminishing capacity, but they must be environmentally sound, preserve valuable resources, and not present undue risk to human health.

HAZARDOUS WASTE

Another component of the solid waste problem became a focus of attention in the early 1970s—the potentially hazardous wastes generated by industrial production. Every year about 3,000 facilities manage 275 million metric tons of hazardous waste as defined by the Resource Conservation and Recovery Act of 1976 (RCRA). Under this definition, wastes are hazardous if they pose a fire hazard, dissolve materials or are acidic, explosive, or otherwise pose danger to human health or the environment. Most of this hazardous waste results from production of widely used goods such as polyester and other synthetic fabrics, kitchen appliances and plastic containers.

Wastes that are not given proper disposal can pose dangers to human health ranging from headaches to cancer. Hazardous wastes also can seriously damage the environment, for example, by seeping into surface waters and killing fish and other aquatic life. The vast majority of hazardous waste managed annually is treated in man-made surface ponds and wastewater treatment plants. A relatively small amount—about 2 million metric tons annually—is incinerated. A number of different treatment technologies are used on hazardous wastes to render them less toxic before final disposal.

A more serious problem is the cleanup of uncontrolled disposal sites containing hazardous wastes and other contaminants. These sites can contaminate groundwater, cause explosions, and present other dangers to people and the nearby environment. Most of these abandoned or inactive waste sites, where hazardous materials have escaped, are linked to the chemical and petroleum industries. Many are municipal landfills that have become hazardous as a result of accumulated pesticides, cleaning solvents and other chemical products discarded in household trash. A few are the result of transportation spills or other accidents. Radioactive materials are hazards at about twenty sites.

Approximately 30,000 potentially contaminated sites may pose a threat to human health or the environment. The Superfund process begins with site discovery; the sites currently identified range from a closed-down hazardous waste incinerator in Maine to a leaking underground pipe in Florida. After site discovery, the EPA conducts a preliminary assessment to determine whether further investigation is necessary. If so, a Site Inspection is conducted to assess the potential danger and the site is evaluated using a Hazard Ranking System. Sites with scores of 28.5 or higher are placed on the National Priorities List for attention under Superfund.

Since the Superfund program was established in 1980, almost 9,000 sites have been determined to require no further action, and over 8,000 site inspections have been conducted. The number of Superfund sites on the National Priorities List now totals 1,224. On these sites, further studies are conducted to determine the nature and extent of the contamination. Cleanup remedies include incinerating contaminated soils to permanently destroy contaminants, depositing contaminated materials in a landfill that is designed to prevent any movement of the contaminants from the fill, and pumping and treating contaminated ground water to clean up an aquifer. To date, over 140 long-term cleanups have been initiated at Superfund sites across the nation.

PUBLIC BUILDINGS

Many of the buildings that make up the vertical infrastructure of our communities are inadequate, either due to their deteriorated condition or because the community's needs have outgrown their capacity. America's schools are just one of the sad examples of the neglect of our built environment.

The National Governors' Association's recently issued 1991 Report on Education cites the fact that the nation's educational infrastructure is old, with many run-down, dilapidated school buildings. A 1988 report by the Education Writers Association found that approximately 25 percent of the nation's school buildings are inadequate, with another 33 percent of the school buildings only adequate. Included in the 25 percent are buildings that have severe environmental problems, primarily asbestos and lead pipes.

The Education Writers Association survey found that facility construction, renovation, and maintenance are not keeping pace with needs, and a backlog of demand is reaching overwhelming proportions. The cost of these needs is estimated to be $84 billion for new and retrofitted construction and $41 billion for school maintenance and repairs.

QUALITY OF LIFE: AN EFFICIENT TRANSPORTATION NETWORK

The U.S. transportation network is the largest, most complex in the world. A smoothly functioning, efficient transportation system is a prerequisite for economic growth and is certainly crucial to our everyday lives. Although far too often taken for granted, just one snowstorm, one bridge collapse, one transit strike, or one airport closing is all it takes to illustrate just how dependent we are on the precision performance of every link in our transportation network.

Almost one of every five dollars spent on goods and services in the U.S. economy is spent on transportation products and services. The U.S. transportation system handles 3.5 trillion passenger-miles (one passenger traveling one mile) and 3.4 trillion ton-miles of freight each year.

Transportation is a key factor in the competitiveness of U.S. industries relative to foreign manufacturers. For every dollar of export goods, about 25 cents is spent on the transportation of raw materials and intermediate goods in the process of being assembled into final products. With the rise in importance of the "just-in-time" method of inventory control, where costs are kept down by having intermediate goods and raw materials arrive at a manufacturer just as they are needed, the smooth functioning of the transportation network is crucial to the cost competitiveness of manufacturing industries.

America's transportation infrastructure is not only deteriorating from aging facilities, but underinvestment in new facilities is overburdening current transportation networks. A look at each of the major components of our transportation system reveals the unraveling fabric of these vital infrastructure systems.

HAZARDOUS WASTE

State	HAZARDOUS WASTE GENERATED IN 1986 (Billions of Metric Tons)	Rank	SUPERFUND SITES Final	SUPERFUND SITES Proposed	Rank

HIGHWAYS

In 1989, Americans will travel more than 2 trillion vehicle miles by auto, truck, bus, and public transit systems, more than triple the mileage traveled in 1956, From 1980 through 1988, traffic growth has increased at an average rate of 5 percent annually. Using conservative estimates of only 2–3 percent annual growth, by the year 2005 highway travel is expected to top 3 trillion vehicle miles, and by the year 2020—only thirty years into the future—total travel in the U.S. is expected to be double what it is today.

America's population will increase by 44 million over the next 30 years. Nearly 90 percent of America's population growth in the 1980s has occurred in metropolitan areas. Three-quarters of the 250 million trips made each day are in metropolitan areas, and over 80 percent of these trips are made in private motor vehicles.

As a result of substantial growth in travel, America's major highway systems in both rural and urban areas have experienced increasing congestion. Urban interstate travel increased 13.4 percent from 1985 to 1987, with other urban freeway and expressway traffic increasing 12.9 percent during the same two-year period. The percent of peak hour travel on urban interstates that occurs under congested conditions has increased from 54 percent in 1983 to 61 percent in 1985 and to 65 percent in 1987.

Travel delays in the nation's largest urbanized areas now cause nearly 2 billion hours of time to be lost annually. A Department of Transportation study has estimated that by the early 21st century, delays are likely to be several times greater than they are today.

A 1983 Federal Highway Administration Study indicated that 11 percent of all labor force work hours are spent on the highways. Obviously, a 10 percent—or greater—reduction in their travel times could have a marked effect of national productivity. The reverse is also true; increases in travel time are having a negative impact on the productivity of the nation's industries.

FHWA statistics show that over 11 percent of principal highway miles are deficient, and are therefore in need of resurfacing or reconstruction. By 1990, 35 percent of the interstate system will have outlived its design life. Most of the highway system was not designed to carry current loads, and a single, modern 80,000 pound truck can inflict as much wear and tear on an interstate highway as 9,600 cars.

Operating costs are closely correlated with pavement condition. Truck costs shoot up by 6.3 cents per mile when road conditions drop from "good" to "fair". Continuing current levels of highway funding will result in further deterioration of the highway system, resulting in an estimated $1,000 increase in vehicle operating costs per household. The relationship fortunately works the other way as well. Every $1 invested in highways reduces direct operating costs by $3 to $4.

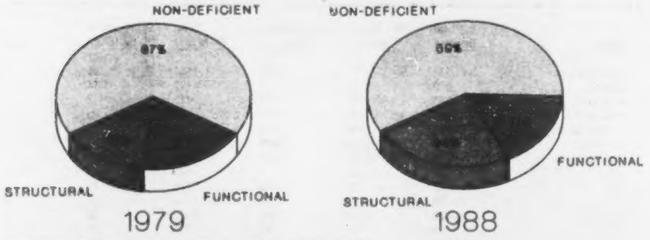
U.S. DEFICIENT BRIDGES



SOURCE: FEDERAL HIGHWAY ADMINISTRATION

Recently the American Association of State Highway and Transportation Officials conducted a comprehensive study of the future capital needs of the nation's surface transportation systems. In their final report entitled *The Bottom Line: A Summary of Surface Transportation Investment Requirements 1988–2020*, AASHTO estimated annual capital investment requirements of $58.5 billion to meet future highway transportation needs. This compares with current annual expenditures by all levels of government of $31.0 billion.

Currently federal, state and local governments spend 3.2 cents per vehicle mile to fund the capital, maintenance and operation expenses for the nation's highway system. Compared with the cost of owning and operating an intermediate sized vehicle, which is currently estimated at 33.4 cents per mile, expenditures on highway infrastructure represent less than 10 percent of vehicle costs. An additional 1.1 cent per mile investment would be enough to fund the current capital investment shortfall, both improving pavement conditions and financing new highways to meet growing population needs.

BRIDGES

Inadequate bridges are one of the nation's most pressing infrastructure problems. Over 41 percent of the 577,710 bridges in the 1988 National Bridge Inventory are either structurally deficient or functionally obsolete. A structurally deficient bridge is one that must be replaced. A functionally obsolete or deficient bridge is one that cannot handle modern traffic loads safely, and either widening or replacement is required.

As of June, 1988, 238,357 bridges were deficient for either structural or functional reasons, a slight 2 percent improvement from the 243,646 bridges rated inadequate in 1986. The tremendous backlog of bridges needing replacement and rehabilitation, along with estimated needs to meet growth, will require an investment of $93 billion between now and the year 2005 as estimated by the Federal Highway Administration.

The number of structurally deficient bridges increased to 135,826 in June of 1988 from 131,582 in 1986. The number of functionally obsolete bridges decreased from 112,064 in 1986 to 102,531 in 1988; part of the decline was the further deterioration of functionally obsolete bridges due to aging and heavy traffic, causing them to be moved to the structurally deficient category.

Bridge conditions on the most heavily-trafficked highways have generally deteriorated. The proportion of Interstate bridges classified as deficient rose from 10.6 percent in 1982 to 13.1 percent in 1984, to 14.3 percent in 1986, and to 15.9 percent in 1988.

Of the total $93 billion in bridge needs, $67.6 billion is needed to eliminate backlog and existing deficiencies; the remaining $25.3 billion is necessary for accruing needs to the year 2005. The federal government should be expending a minimum of $3.5 billion annually through 2005 simply to rebuild and replace deteriorated bridges; to meet ongoing needs and support the growth in population, a minimum of $4.9 billion should be spent each year.

At the present time, and for a number of years, the federal government has been spending less than one-third of the minimum $3.5 billion needed to preserve and provide safe bridges. According to Secretary of Transportation Samuel Skinner, the required repair and replacement of highway bridges in this country will cost two-thirds as much as the original construction of the interstate system.

AIR TRANSPORTATION

The air transportation system is an increasingly important segment of the infrastructure, now accounting for 17.2 percent of all intercity passenger miles traveled. In 1988, U.S. scheduled airlines carried 454.5 million passengers over 423 billion passenger miles on

SOURCE: Federal Highway Administration, U.S. Department of Transportation

6.7 million flights. Although 66 percent of all Americans over the age of 18 have flown on a commercial airline, the majority of these miles are flown by business travelers, and the air transportation network is crucial to both management of industry and service enterprises. Revenue passenger miles flown have increased on average by 8.9 percent annually over the past ten years, severely straining the capacity of the nation's air transport system.

The Federal Aviation Administration is forecasting a 5.0 percent annual growth rate in the number of revenue passenger miles flown by major air carriers from 1988 through the year 2000. Commuter and regional airlines are expected to grow even faster, increasing their revenue passenger miles flown at an annual rate of 8.7 percent through the turn of the century.

As air travel continues to grow at this rapid pace, the Federal Aviation Administration estimates that the number of "seriously congested" airports will increase to 58 by the year 2000, having an impact on 76 percent of all passengers. This is a substantial increase from the current congested conditions. In 1988, the FAA calculated that 16 commercial service airports met the "very congested" criteria, having an impact on the 41 percent of all air passengers whose routes took them through these 16 airports.

In September, 1989 the Federal Aviation Administration awarded a $60 million grant to Denver, Colorado, taking a large step forward in the process of constructing the first new major airport in 15 years. The airport, which has been under review for two years, will be built on a 53-square mile site 18 miles northeast of Denver. The new Denver airport is expected to begin operation in 1993 with five runways, and plans are in the works to expand the airport to 12 runways by the year 2020.

The new Denver airport should handle 817,000 take-offs and landings and board 33.2 million passengers by the year 2000. The current airport, Stapleton International, frequently only operates with one runway during inclement weather, causing backups throughout the nation's air traffic system.

Secretary of Transportation Samuel Skinner has commented, "It's a national embarrassment that we've had no new airport in the U.S. since 1974," estimating a need for a 55 percent increase in airport capacity by the turn of the century.

Airport capacity expansion needs have been computed by the Federal Aviation Administration as part of the National Plan of Integrated Airport Systems (NPIAS). Although some construction has occurred since the NPIAS plan was published, the vast majority of these aviation needs remain backlogged. The assessed needs break down as follows:

Increase Capacity and Expand System—
$17.4 billion
Update and Improve System—$4.3 billion
System Maintenance—$2.6 billion

AIRPORTS: CONGESTION CAUSES DELAYS

Airport	Increase In Time Spent On Runway Over Last 10 Years

PORTS AND WATERWAYS

U.S. ports and waterways are integral to the transportation of the goods produced and used by America's agricultural sector, industries, and consumers. In 1988, international shipments rose 16 percent. The value of exports increased by 50 percent over the three-year period from 1985 to 1988; the value of imports rose 28 percent.

The U.S. has 186 deep draft U.S. ports located along the Atlantic, Gulf, Pacific, and Great Lakes coasts. In addition, deep-draft navigation on the Great Lakes–St. Lawrence Seaway System requires a series of 16 locks, with 23 separate chambers, and connecting channels. Taken together, the U.S. inland waterway navigation system carries about one-third of total U.S. waterborne tonnage (foreign and domestic).

Expansion and modernization of the nation's ports and waterways will require investment in a number of projects. On the inland waterway system, a number of locks and chambers are so old that they require major rehabilitation or replacement. For seaports, modernization is necessary to achieve transportation cost savings for a number of ports with depths of less than 50–55 feet. The Water Resources Development Act of 1986 and 1988 authorized over 38 projects which should be constructed to deepen and/or widen channels in these ports, at a total cost of over $2.7 billion.

Over the last 15 years there has been an increase in the size of vessels involved in waterborne commerce. In 1980, about 35 percent of vessels exceeded 10,000 dead weight tons (dwt). As of 1987, over 60 percent of the active tonnage in the world tanker fleet exceeded 10,000 dwt. These vessels need channels that are deeper than 50 feet. However, there are no harbors on the U.S. Atlantic and Gulf coasts which have depths capable of handling a fully loaded vessel of that size; no harbor currently exists with a depth greater than 45 feet. Only the Pacific Coast harbors of Los Angeles/Long Beach and some of the ports at Puget Sound have depths of 55 to 60 feet.

AIRPORT CAPACITY EXPANSION NEEDS (In Millions)

The driving force behind the need to service large vessels is the cost savings achieved by use of larger vessels. A transportation cost savings of $3 to $5 per ton for trips from the U.S. Atlantic coast to Europe can be achieved, with much greater savings for trips to the Far East. The Office of Technology Assessment has estimated that 10 percent can be cut from the cost of export coal as received by Europe and the Pacific Rim countries if U.S. ports could handle super-colliers. A Congressional Budget Office report has noted that it would appear cost-effective to dredge one or two ports to 55 feet.

CONCLUSION

America's infrastructure investment must be protected and expanded—not just because it's necessary for our health and safety—not just because it's for the prosperity of the economy—not just because it's vital to our world competitiveness—not just because it's essential to our continued growth as a nation. It's critical to the quality of our lives and to our continued faith in our government and ourselves as a great nation.

Innovative and equitable infrastructure initiatives are required. The task will require a strong partnership among the federal government, states, cities, counties, other governmental units, and the private sector. All must maintain their fiscal support for infrastructure programs, and seek new ways to make progress on many fronts, including capital planning, creative funding strategies, improved management, and technological innovation. Although the nation must address the federal budget's imbalance, the country cannot afford to ignore the crucial role that public works play in a vital economy. The long-range impact on the nation of not going forward today with vital infrastructure projects is short-sighted. Infrastructure must be a top national priority, and to resolve the crisis in the nation's public works:

- Investment in infrastructure must be increased.
- All levels of government must take steps to encourage innovative technology, financing, and public/private partnerships.

Legislative goals to meet those objectives:

- There should be no further funding reductions in existing federal programs that address infrastructure needs.
- The existing federal infrastructure trust funds must be continued, adequately funded, and fully expended for their intended purposes.
- Federal restrictions on the use of tax-exempt financing for infrastructure purposes should be eliminated.
- A federal capital infrastructure program should be created to provide assistance to states and localities in meeting infrastructure needs.
- A federal long-term multi-year capital budget should be established.

Rebuild America is a broad coalition of public and private organizations committed to the infrastructure challenge. Its Chairman is Mayor Terry Goddard, President of the National League of Cities and Mayor of Phoenix, Arizona. It includes the mayors, city councilmen and other public leaders whose job it is to maintain, inspect, and plan for the building and rebuilding of our public facilities. They are supported by the engineers, builders, financiers, contractors, and architects whose careers are dedicated to the highest standards of quality, safety, and cost effectiveness.

INCREASING INFRASTRUCTURE INVESTMENT:
MAKING AMERICA'S ECONOMY COMPETITIVE AGAIN

EXECUTIVE SUMMARY

The facts are shocking: many U.S. industries have lost the competitive advantage which made this nation the world's economic leader. The U.S. trade deficit hit record levels in the third quarter of 1987, setting a new high in a lengthening string of trade deficits, and each year the interest payment that Americans must send overseas to finance the deficits rises.

What can be done about the trade deficit? First and foremost, the U.S. manufacturing sector must rebuild its share of world trade. Many possible remedies have been proposed: management techniques, flexible manufacturing, education, research and development. Much attention has been given to the role that modernizing factories plays in spurring economic growth. More attention needs to be given to the role infrastructure plays in enhancing the quality of everyday life, by providing the support network for our neighborhoods and communities. Greater attention needs to be given to the vital role that *public facilities — our nation's infrastructure of highways, ports, airports, public buildings, water supply and wastewater treatment facilities — play in the nation's economic competitiveness.*

The necessity of providing adequate public works to ensure a solid foundation for economic development is not a new or untested theory. The Greek scholar Xenophon stressed the importance of public works in 400 B.C. in a work titled *On the Means of Improving the Revenues of the State of Athens.* In 1776 Adam Smith, in *The Wealth of Nations,* wrote that the provision of necessary public works is one of the three critical functions of government.

American history has attested to the successes of public works in fostering economic growth. From the Erie and Panama Canals to the first urban water and sewer systems to the Interstate highway program, public works undertakings have launched economic development and growth. But an examination of recent history shows a dramatic reversal.

Although *net* investment in public works by federal, state and local governments — the share of output devoted to adding to the nation's public capital stock *after* accounting for physical depreciation — averaged 2.3 percent of gross national product in the late 1960's, it dropped to a mere *0.4 percent of GNP in 1980-1984.* This decline is having a tremendous, but largely unseen, impact on the nation's economy:

- Urban traffic congestion has increased by 50 percent over the last 10 years. If a worker is delayed 20 minutes each day by rush hour traffic congestion, by the end of his or her career, two working years will have been wasted.
- In 1984, 1.4 billion gallons of gasoline was wasted due to congestion; by 2005, waste could soar to 7.3 billion gallons.
- In 1986, schedule delays on the nation's airlines exceeded 2,000 hours per day — the equivalent of grounding 200 aircraft daily.
- Half of all commuities in the country cannot expand because their wastewater treatment plants are operating at or near capacity.
- Leaky pipes cause some major cities to lose as much as 30 percent of their fresh water supply each day.
- Transportation costs represent about 15-30 percent of the landed price of agricultural exports. Clearly, the inadequacy of many rural roads and bridges is a concern for the future of America's agricultural exports.

The evidence is clear — a great deal of harm has been done to the American economy from a lack of public works investment, and this damage is continuing largely unchecked. Rapidly-growing megacounties are straining to meet infrastructure challenges, while central cities are similarly pressed without an expanding tax base. Added to this is the recent withdrawal of certain federal assistance programs, such as revenue-sharing, and restrictions on tax-exempt bond financing passed by Congress in the Tax Reform Act of 1986.

Several recent economic studies have started to quantify the economic impact of years of neglect of America's infrastructure. A study done in October, 1987 at the Federal Reserve Bank of Chicago by senior economist David Alan Aschauer indicates that infrastructure investment increases the private sector capital stock by influencing the rate of return to private investment. Aschauer concludes that if the U.S. had held infrastructure investment steady at 2.1 percent of GNP, its 1953-to-1969 average, throughout the 1970's and early 1980's, then the downward trend in the rate of return to private capital would have been eliminated, increasing the private capital stock by $39 billion over its actual 1984 level.

Studies at the Federal Reserve Bank of Philadelphia by Gerald Carlino and at the Federal Reserve Bank of Cleveland by Randall Eberts add to the evidence. By reorienting priorities for public spending to upgrade and expand the public infrastructure, the U.S. can increase the productivity of the workforce by relieving congestion which is choking off growth, and improve the nation's competitive position in an increasingly competitive international marketplace.

Other nations have attacked these problems: Germany and Japan each use a five-year plan to ensure continuous infrastructure funding. Japan is clearly going the extra mile; under an ambitious "Technopolis" plan, Japan will create nineteen high-technology industrial complexes, complete with infrastructure, by 1990.

In searching for solutions to the nation's enormous trade problems, we cannot afford to ignore the one solution — infrastructure investment -- that will enable this country to become competitive once again. As the **National Council on Public Works Improvement** recently concluded in its final report, "the quality of America's infrastructure today is barely adequate to meet current requirements and insufficient to meet the demands of future economic growth." Unless we, as a nation, heed the Council's warning, instead of increased productivity, we will only spend more and more due to inefficiency and congestion, and risk tying up our nation's economic future in one vast, unproductive, traffic jam.

The National Council on Public Works Improvement has outlined a strategy for improving America's public works. The elements of that strategy are:

- A national commitment, shared by all levels of government and the private sector, to increase capital spending by as much as 100 percent above current levels;
- Clarification of the respective roles of the federal, state, and local governments in infrastructure construction and management to focus responsibility and increase accountability;
- More flexible administration of federal and state mandates to allow cost-effective methods of compliance;
- Accelerated spending of the federal highway, transit, aviation, and waterways trust funds;
- Financing of a larger share of the cost of public works by those who benefit from services;
- Removal of unwarranted limits on the ability of state and local governments to help themselves through tax-exempt financing;
- Strong incentives for maintenance of capital assets and the use of low-capital techniques such as demand management, coordinated land-use planning, and waste reduction and recycling;
- Additional support for research and development to accelerate technological innovation and for training of public works professionals; and
- A rational capital budgeting process at all levels of government.

The National Council on Public Works Improvement acknowledges that none of these steps will be easy or unopposed. Meanwhile, unanimity exists that America's infrastructure suffers from neglect. Thus, the National Council on Public Works Improvement recommends that capital investment be raised by at least 100 percent.

INTRODUCTION

The facts are shocking: many U.S. industries have lost the competitive advantage which made this nation the world's economic leader. Consider the following:

- The U.S. trade deficit was a record $17.6 billion in the month of October, 1987, a 25 percent increase from September.[1] The November, 1987 deficit of $13.2 billion, while an improvement, remains high by historical standards.
- In January through November of 1987, the U.S. economy ran a cumulative merchandise trade deficit on manufactured goods of $159.0 billion for the eleven-month period.[2]
- As a result of years of trade deficits, U.S. debt to foreigners could exceed ***$600 billion*** by the end of 1988, even if the trade deficit begins to shrink immediately.[3] At the current pace, the net investment deficit will reach $1 trillion by the early 1990's.
- The President's Council of Economic Advisers is predicting that the economy, as measured by real gross national product, will grow at a slow 2.4 percent rate in 1988. As noted above, 1 percent of this growth will go to service debt held by foreigners, leaving only 1.4 percent for Americans.[4]
- One way to make up the difference is for Americans to consume less. In fact, the U.S. standard of living, long the envy of the world, has already been slipping as a result of the economic situation. The income of the typical household after adjusting for inflation was almost 8 percent higher in 1973 than it was in 1985.[5]

One writer has compared trying to figure out what to do about the trade deficit to the joke about asking the old farmer how to get somewhere. "Well," he replied after long thought, "if I were you, I wouldn't start out from here."[6]

But clearly, the nation must begin from here, and must solve these momentous problems. To begin to repay the foreign debt, U.S. manufacturing must revive and rebuild its share of world trade. Services are not a sufficiently large part of U.S. exports to drive the trade balance back to a surplus position.

Many possible remedies have been proposed — new management techniques, more flexible manufacturing, increased education, additional focus on applied research and development, and increased investment in new equipment all have been advocated as partial solutions to America's economic problems.

Although recognition has been given to the role that ***private*** capital investment — modernizing factories — plays in spurring economic growth and American competitiveness, insufficient attention has been given to the vital role that ***public capital investments*** — our nation's infrastructure of highways, ports, airports, water supply and wastewater treatment facilities, and other public investments — play in supporting and enhancing the nation's economic growth.

One very effective way to speed up economic growth, and help solve our trade imbalance, is to increase investment in public infrastructure. Unfortunately, such investments have actually ***decreased*** in this country in recent years.

The evidence indicates that net investment in infrastructure by federal, state, and local governments averaged 2.3 percent of gross national product in the late 1960's, but dropped to only 0.4 percent of GNP in 1980-1984. In terms of constant 1982 dollars, public infrastructure net investment was $11.5 billion in 1984, down from $27.6 billion in 1953 and $62.8 billion in 1964.[7] The net result of this disinvestment in public works is a growing backlog of capital needs in every aspect of the nation's infrastructure, as shown in the appendix.

Failing to upgrade, repair, and expand the nation's infrastructure over the past twenty years was a major policy mistake; one that must be rectified immediately if America is to reclaim our previous position of economic leadership.

A closer look at the interrelationship between infrastructure investment and economic growth will demonstrate the importance to the economy of public works, and identify the dwindling investments of the last twenty years as a prime contributing factor to our current economic crisis.

A HISTORICAL PERSPECTIVE ON THE RELATIONSHIP BETWEEN INFRASTRUCTURE AND ECONOMIC GROWTH

The necessity of providing adequate public works to ensure a solid foundation for economic development is certainly not a new or untested theory. In fact, the idea has been around for at least 2400 years.

John Kenneth Galbraith, in his recently published book *Economics in Perspective,* describes the work of the Greek scholar Xenophon (c. 440-c.355 B.C.), a student of Socrates and one of the earliest students of economics. In a work titled *On the Means of Improving the Revenues of the State of Athens,*[8] Xenophon considered the sources of the relative prosperity of the city and wrote of how the prosperity of the city could be improved. He noted that Athen's successes were due to the excellence of the surrounding agriculture, and he stated that the city's prosperity could best be enhanced by extending hospitality and privileges to foreign merchants by giving proper attention to public works.

In 1776 Adam Smith, certainly one of the most eloquent and insightful economic thinkers of any era, advanced the history of economics by a giant stride with the publication of *An Inquiry into the Nature and Causes of The Wealth of Nations.* In his treatise, Smith advised that the role of government should be strictly confined to three functions. These crucial governmental obligations are the provision for the common defense, the administration of justice, and the provision of necessary public works.

The rationale for the provision of public works as the third crucial function of government is stated by Adam Smith as follows:

"The third and last duty of the sovereign or commonwealth is that of erecting and maintaining those public institutions and those public works, which, though they may be in the highest degree advantageous to a great society, are, however, of such a nature, that the profit could never repay the expense to any individual or small number of individuals, and which it therefore cannot be expected that any individual or small number of individuals should erect or maintain. . . .The works and institutions of this kind are chiefly those for facilitating the commerce of the society, and those for promoting the instruction of the people."[9]

Public Works In America — The Early Years

In American history, public works have indeed been a major stimulus to economic development and prosperity. As President, Thomas Jefferson favored Federal support of transportation as a boon to commerce, and his Secretary of the Treasury, Albert Gallatin, produced a national transportation plan in 1808 with his *Report on Roads and Canals.* Gallatin argued that their utility in stimulating commerce " is at this time so universally admitted as hardly to require any additional proofs."[10]

Although some canals were financed or built privately, the majority were built or financed by the public sector. The accomplishments of the canals, and turnpikes, in lowering transportation costs were impressive.

In fact, when DeWitt Clinton pushed the Erie Canal across New York State in the early 1800's, the primary purpose was to open up the western part of the state and the Great Lakes region to economic use, and by so doing to forestall Canadian development of the St. Lawrence — which would have made maritime Canada, not the U.S., the hub of New World commerce. When the Erie Canal opened, the cost of transporting wheat from Buffalo to New York was lowered from roughly $100 per ton to $10 per ton; clearly, the Canal accomplished its goal remarkably well.[11]

Federal involvement in public works investments to 1850 has not been precisely quantified, but one estimate places the total expenditures on internal improvements at 11 percent of the federal budget during 1820-1840, and this is thought to be a low figure because this did not include subsidies to state and private projects.[12]

Although the importance of federal public works up to 1850 was still modest, the role of the states and cities was central. State and local public works included roads, banks, canals, railroads, scientific surveys, salt works, sewers, public buildings, water systems, and more.

Urban water systems were conceived, and used, as a means to promote local economic growth. One study notes that "City boosters considered water works as crucial in the competition between municipalities for population, trade, and industry and emphasized their possession in touting their cities."[13]

In the quarter of a century after 1850, government investments in transportation infrastructure continued to be sizeable. Although the importance of the states as a source of funds declined in the post-Civil War years, Congress sharply increased the scale of its federal aid.

Until 1860, total investment in canals amounted to some $190 million, of which the public component comprised 73 percent, or $139 million. Total railroad investment by that time was $1.145 billion, of which some $280 million or 24 percent was public. The absolute amount of government aid to transportation in the Civil War period was also immense, and may have totalled $350 million, most of which occurred between 1860 and 1873.

Public transportation investment clearly had an impact on the pattern and speed of the nation's economic development in its first century. In the antebellum years, canals and later railroads opened up one region after another and widened agricultural markets. The expansion of agricultural markets allowed exports such as cotton to pay for vitally needed imports. After the Civil War, Western expansion made America the granary of the Western world, and the availability of food at lower prices raised urban living standards, enabling city dwellers to pay for the manufactured products of many new, expanding industries.

Public Works in America — After 1870

The 1870's appear as a great divide in the history of public works. With transportation needs being increasingly met by private enterprise, the federal role dwindled until 1932, and consisted largely of river and harbor construction, lighthouse building, reclamation, the building of "military" roads, and some other minor items (See Table 1).[14]

However, two exceptions merit special attention. First, the turn of the century saw the beginnings of reclamation work in the trans-Mississippi West. The second was an event of even greater significance — the decision to undertake completion of the Panama Canal, the most spectacular public work since the Pyramids. Others had repeatedly tried and failed to complete the project. Finally begun in 1904, the final cost of $352 million was larger than ***total Federal expenditures from the birth of the nation through 1896.***

Like the Canal itself, the benefits were immense. It sharply reduced the cost of shipping the world's goods. By the 1920's traffic exceeded 7000 ships per year. By the 1970's 15,000 ships and 100 million tons a year passed through the Canal.

Public works as a fraction of total construction began to rise during the late nineteenth century; most of the growth took place at the state and primarily the local level (See Table 2). Approximately one-fifth of total state and local spending was devoted to capital items from 1870 on, and state and local capital formation rose from less than one percent to well over two percent of GNP by the 1920's.

In the half-century after the Civil War, America became an urban society. In 1870, a quarter of the population lived in urban places (includes towns

TABLE 1

Federal Construction, 1869-1928 (millions of dollars and percent)[1]

Year	Federal Construction[2] (dollars)	River and Harbor to Federal Total Construction (percent)	Federal Construction to Federal Spending (percent)	Federal Construction to GNP (percent)
1869-1878	11.0	45	4.0	0.15
1879-1888	12.0	73	4.6	0.11
1889-1898	23.5	64	6.7	0.17
1899-1908	49.2	43	8.7	0.28
1909-1918	65.0	56	3.2	0.19
1919-1928	120.0	46	3.3	0.10

Urbanization resulted in unprecedented demand for expanded and purer water systems. Yet the progress toward pure water was extraordinarily slow, and hampered early on by a lack of understanding of water-borne diseases. Most American cities were completely lacking in sanitary sewers until the 1880's, and this was a major contributor to poor water quality and tremendous public health problems.

Data on capital formation in sewer and water systems is exceedingly sparse. It appears clear that these public sanitation systems accounted for only a small fraction of total state and local expenditures through 1910. Their benefits, however, appear to have been enormous. Between 1880 and 1910, life expectancy at birth for male children rose by eleven years, and for female children rose thirteen years. The reduction in suffering and illness was immeasurable.

By calculating the additional output from longer working lives and reduction in lost time due to illness, a social rate of return to public health investments has been calculated at between 6 and 16 percent, at a minimum. Not only were these infrastructure investments too little, too late to relieve untold human suffering — the rate of return to society would easily have exceeded the 4-5 percent earned on alternative private capital investments.

Expenditures on streets and bridges accounted for a major portion of most cities' public works investments from the 1870s on. In 1909, payments for streets and roads constituted 32 percent of public improvements. By contrast, water works, the next largest single item, accounted for 20 percent, schools made up 13 percent, and sewage disposal was 10 percent.

Bridge construction, though a smaller expenditure item, resulted in spectacular successes. The Mississippi was bridged at St. Louis at a cost of $10 million in 1870. New York's Brooklyn Bridge was completed in 1883 and spanned 1595 feet, six inches. Built in thirteen years at a cost of $15 million, the Brooklyn Bridge has been called the greatest municipal public work of the nineteenth century.

After 1870, cities engaged in an extremely wide variety of public works. While not the primary focus of municipal investment, the scope of this building indicates the range of activities considered public works necessary for development by one city or another. Electrical generating plants, wharves and piers, city halls, court houses, police and fire stations, hospitals, asylums, libraries and museums were all constructed as public facilities.

Additionally, some cities built ice plants, and one owned a bank. Even a number of slaughter houses, printing plants, baths, ferries, markets, laundries, parks, heating plants, coal yards, and milk pasteurization works were all publicly built.

Public construction in the 1920's was characterized by an increasing volume of public building, a continued small but important role for the federal government, and a road-building boom reasserting an historic concern with transportation. Non-military and non-residential public works construction, paced by schools and roads, rose sharply and continuously through the 1920's. Private investment peaked in 1926, but public works investments sustained the economy for several more years, continuing to rise and only peaking in 1931 at 3.5 times the 1920 level.

Expenditures on road construction grew to between 34 and 38 percent of all public construction during this period and furthered the trend toward suburbanization. Highway construction, and the demand for automobiles which it engendered, was a dynamic element in the economy of the 1920's.

States and localities had been the primary source of public construction in the 1920's, but after 1931 declining tax revenues and collapsing bond markets forced them to deeply cut public investments. When federal construction expanded as a result of New Deal public works programs, the federal construction share grew to between 60 and 65 percent of public construction during 1933-1938.

During the World War II era, the war effort brought about a shift in the composition of public construction. Traditional public construction, such as roads and sewers, had a total shortfall equal to about 3.3 years of building at 1940 levels.

At the same time, the public sector undertook the tremendous task of adding to America's industrial capacity, and built 56 percent of new industrial volume. Between 1940 and 1945, the War Production Board and related agencies financed construction of approximately $11 billion in new plant and equipment which was usable for civilian manufacturing when the war ended. In addition to $8.6 billion of privately-financed manufacturing investment, this equalled one-half of the book value of all manufacturing assets in existence in 1939.

Non-military, non-residential Federal public works quickly returned to "normal" almost immediately after World War II, then nearly doubled in the 1947-1950 period. Much of this growth was due to a $500 million increase in expenditures on conservation, rivers, and harbors. More importantly, state and local construction increased dramatically from $600 million in 1945, to $1.4 billion in 1946, and soared to $5.2 billion in 1950. Most of the increase came in three areas — sewer and water works, schools, and road construction. Taken together, public construction expanded by 45 percent between 1946 and 1950.

From 1950 to 1960, non-military, non-residential public construction rose by 58 percent, from $8.6 billion to $13.6 billion. Needs created by the baby boom, the automobile, and increasing urbanization led to construction of schools, roads, and public health investments which, when taken together, amounted to almost 90 percent of the increase in public construction from 1950-1960.

In the 1950 to 1960 period:

- Real construction expenditures for new schools (adjusted for inflation) increased by 72 percent.
- Expenditures on sewers and water works rose by 46 percent.
- Construction began on the largest public work to date in American history, the Interstate Highway System. By 1960, 32,000 miles were built and in 1960, $5.4 billion was spent on highways, 40 percent of all public construction.[15]

AMERICA'S INVESTMENT IN INFRASTRUCTURE — THE RECENT PRECIPITOUS DECLINE

An examination of the twenty years from the mid-1960's through the mid-1980's shows a dramatic reversal in the relationship between infrastructure investment and economic development and growth in the United States.

Although net investment in public works by federal, state, and local governments — the share of output devoted to adding to the nation's capital stock after accounting for physical depreciation — averaged 2.3 percent of gross national product in the late 1960's, it dropped to a mere *0.4 percent of GNP in 1980-1984* (See Table 3 and Chart).

In constant 1982 dollars (adjusted for inflation), public net investment in infrastructure plunged from $62.8 billion in 1964 to $11.5 billion in 1984, despite an increase in the total share of government in the gross national product. In constant 1982 dollars, again adjusted for inflation, total government spending grew from $507 billion in 1953 to $1.174 trillion in 1984.[16]

The National Council on Public Works Improvement analyzed this decline differently by measuring public works outlays, including both operations and maintenance and capital outlays, but exclusive of depreciation, as a percentage of gross national product. The Council concluded that aggregate public works outlays, including spending on operations, declined from 3.75 percent of GNP in the early 1960's to 2.6 percent in 1984.

QUANTIFYING THE HARMFUL ECONOMIC IMPACT OF DECLINING INFRASTRUCTURE INVESTMENT

Until recently, too little has been done to quantify the impact on the U.S. economy from diminishing investment in the nation's infrastructure. The anecdotal evidence has, however, indicated the tremendous cost and waste attributable to our lack of infrastructure. Consider the following:

- Transportation productivity and efficiency is detrimentally impacted by highway congestion, weight limitations on bridges and emergency maintenance required as a result of potholes and roads in disrepair. Trucking industry sources have indicated that rerouting trucks causes an increase in the time of a run by anywhere from 10 to 100 percent, and in the transportation sector, time is money.
- A load-posted bridge carrying 2000 autos and 200 trucks per day (a relatively light traffic load) must be detoured by trucks. At a detour length of five miles, with the trucks' running costs at 50 cents per mile, the 200 trucks per day incur additional total operating costs of $182,500 per year. If the bridge is closed and the 2000 autos per day must also detour the five miles, the total additional operating costs at 20 cents per mile are $730,000 per year for the autos. The combined costs for autos and trucks would be $912,500 per year.[17]
- In Pittsburgh, U.S. Steel estimated that it paid at least $1 million a year in additional costs to detour its trucks 18 miles around a major bridge closed by the state for lack of repair.[18]
- Low unit transportation costs are a major contributor to the competitiveness of U.S. agricultural products in world markets. Because transportation costs represent about 15-30 percent of the landed price of exports, the inadequacy of many rural roads and bridges is a concern for the future of America's agricultural exports.[19]
- If a worker is tied up in traffic 20 minutes each working day — 10 minutes to and 10 minutes from work — and stays on the job for 45 years, he or she will spend nearly *two working years* tied up in traffic. The share of rush-hour traffic on urban interstates rated as congested has increased from 40 percent in 1975 to 61 percent in 1985.[20]
- In all, the nation wasted an estimated 1.25 billion vehicle hours and 1.38 billion gallons of gas in traffic congestion on limited access highways in 1984. By 2005, waste could soar to 6.91 billion hours and 7.32 billion gallons.[21]
- In 1986, schedule delays on the nation's airlines exceeded 2,000 hours per day — the equivalent of grounding 250 aircraft every day. In dollar terms, delays cost consumers and air carriers over $3 billion in 1986 alone.[22]
- Americans boarded scheduled U.S. airliners a record 418 million times in 1986, up 46 percent from five years earlier. By the year 2000, the Federal Aviation Administration estimates the total figure could increase to 750 million, resulting in even more congestion.

The agency predicts that the number of "seriously congested" airports will soar to 58 by then, affecting 74 percent of passengers, compared with 16 airports and 39 percent in 1986. There hasn't been a major airport built in the U.S. since Dallas/Ft. Worth was built in 1974 when the airlines carried only 207 million passengers. That is less than half of the 1986 volume.[23]

- The Port Authority of New York and New Jersey estimates that the region has lost 600,000 jobs as a direct result of infrastructure deterioration.[24]
- Half of all communities in the country cannot expand because their wastewater treatment plants are operating at or near full capacity.[25]
- Leaky pipes cause some major cities to lose as much as 30 percent of their fresh water supply each day.[26]

Recent Studies Quantify the Harmful Impact of Inadequate Infrastructure Investment

A great deal of harm has been done to the American economy from a lack of infrastructure investment, and this damage is continuing unchecked. But the magnitude of the present and growing crisis is difficult to ascertain from these specific examples of waste and lost productivity.

Fortunately, significant strides have been made in several recent economic studies that quantify the economic impact of thirty years of neglecting America's infrastructure.

Private Capital Stock is Reduced by Insufficient Infrastructure Investment

In October, 1987 the Federal Reserve Bank of Chicago published work by senior economist David Alan Aschauer examining the level of public capital expenditures required to spur productivity and economic growth.[27]

Aschauer began by examining recent trends in public expenditures, as discussed earlier in this report. He then shows that public sector investment ultimately increases the private sector capital stock by influencing the rate of return to private investment. His study shows that public capital expenditures are a critical determinant of the nation's long-run production potential.

Aschauer notes that during 1953-1971, both the private and public net investment rates exceeded the growth rate of the work force, producing rising private and public capital stocks per worker. However, since 1971, net public infrastructure investment has declined precipitously from 1.8 percent of GNP to only 0.4 percent of GNP, and the amount of public capital per worker has declined from $15,576 in 1971 to $14,224 in 1984. During the same period, the private capital stock per worker has expanded from $26,654 in 1971 to $29,905 in 1984.

Public capital devoted to infrastructure purposes is complementary to private capital in the production of goods and services. This implies that a rise in public capital stock makes private capital more productive. Thus, higher levels of public investment filter into elevated profit rates for the nation's businesses. Table 3 is reproduced again as Table 4 with an addition — a third column has been added that contains annual averages of the net profit rate of nonfinancial corporations in the U.S.

In a competitive marketplace, the net profit rate approximates the marginal productivity of private, nonfinancial corporate capital. The economy's rate of profit — the private rate of return on invested capital — tends to be high when the level of public capital formation is high over the course of several years. In particular, the decade of the 1960's reveals the highest returns on the private sector capital stock corresponding to the highest rates of public sector capital accumulation.

Deficient capital formation alone is not responsible for the recent low rate of return to the nation's capital stock and the slowing rate of investment. Low levels of capacity utilization in the economy's factories, mines, and utilities as a result of oil price increases and real exchange rate appreciation helped diminish the net profits obtained per unit of capital. However, Aschauer's statistical analysis indicates that the level of public capital strongly influences the net return to private capital even after accounting for these cyclical effects.

The empirical results show that a 10 percent increase in the capacity utilization rate from its 1984 value of 74 percent would have raised the profit rate from 9.9 to 11.4 percent. An additional 10 percent increase in the public capital stock (five years of extra net public investment of $32.4 billion, or an extra 0.9 percent of GNP) would have increased the rate of return by a still larger amount to 12.6 percent.

TABLE 3

Government Spending and Infrastructure Investment

Year	Total Government Expenditures (% of GNP)	Public Net Investment in Infrastructure (% of GNP)
1953-59	28.1	1.9
1960-64	27.6	2.2
1965-69	29.1	2.3
1970-74	31.2	1.4
1975-79	32.1	0.7
1980-84	33.9	0.4

Source: "National Income and Product Account", U.S. Department of Commerce and "Flow of Funds", Federal Reserve System.

Aschauer's analysis indicates that if the U.S. had held net infrastructure investment steady at 2.1 percent of GNP — its 1953-to-1969 average — throughout the 1970's and early 1980's, the downward trend in the rate of return to private capital would have been eliminated. Although the fluctuations from changed currency valuations and capacity utilization would have remained unchanged, the downward slide would still have been halted.

TABLE 4

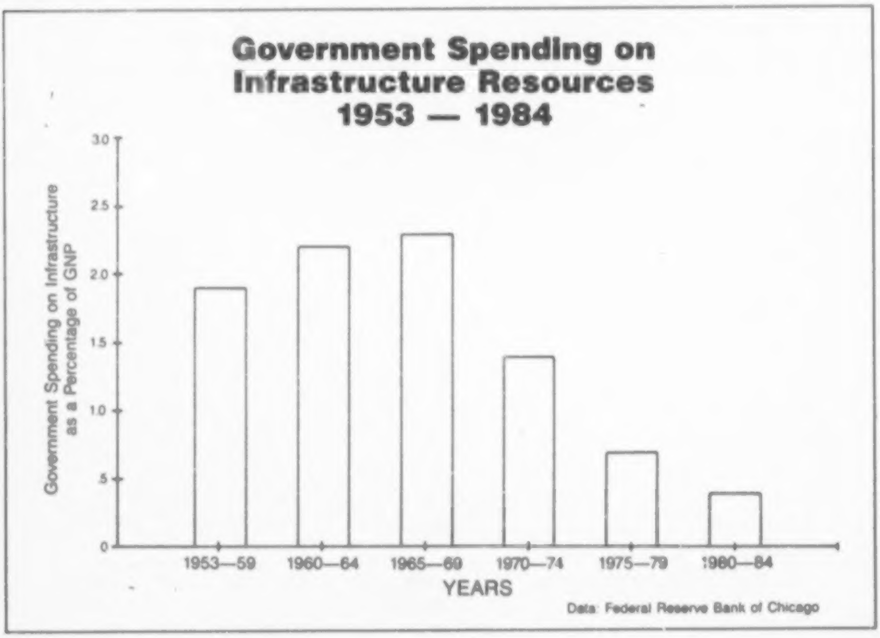
Infrastructure Investment and the Return to Private Capital

Year	Total Government Expenditure (% of GNP)	Public Investment in Infrastructure (% of GNP)	Profit Rate (%)
1953-59	26.1	1.9	10.8
1960-64	27.6	2.2	11.6
1965-69	29.1	2.3	13.3
1970-74	31.2	1.4	9.8
1975-79	32.1	0.7	9.1
1980-84	33.9	0.4	7.9

Sources: "National Income and Product Accounts", U.S. Department of Commerce and "Flow of Funds", Federal Reserve System.

As the rate of return to private capital increases in the simulation with the higher public investment, expenditures on private capital stock would be stimulated, ultimately inducing a cumulative rise in the private capital stock of roughly $39 billion over its actual 1984 level of $3,442.8 billion.

The national capital stock would have risen from $5,063.6 billion to $5,137.6 billion, a 1.5 percent increase. Therefore, the net effect of temporarily increasing the public investment rate is a substantial increase in the national capital stock. Public investment policy clearly has important conse-



Government Spending on Infrastructure Resources 1953 — 1984

Data: Federal Reserve Bank of Chicago

quences for the economy's production possibilities.

Aschauer concludes by stating that the public capital stock appears to be too low relative to the private capital stock, thereby depressing the rate of profit to the nation's stock of plant and equipment. He states that more attention should be paid to the composition of the government's expenditure, and particularly its effects on the nation's infrastructure needs.

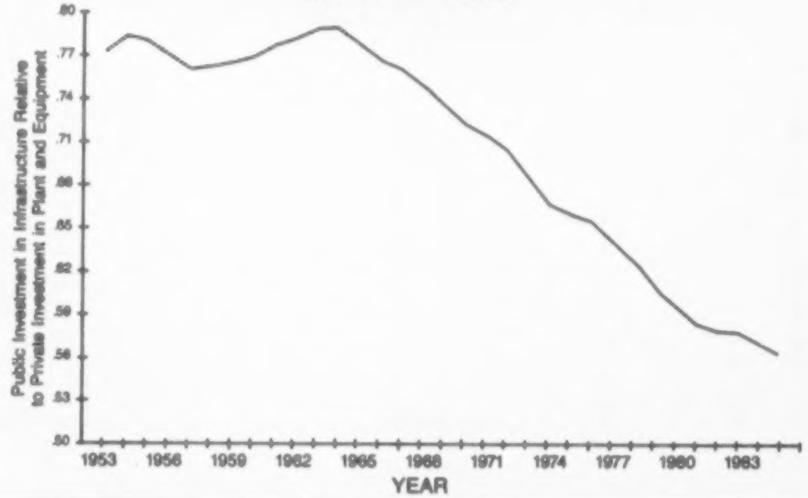
The share of total government spending devoted to public capital formation has dropped from 8 percent in the 1960-1964 period to a meager 1.2 percent between 1980 and 1984. A chart on page 11 illustrates the percentage of total public works spending by each level of government. By reorienting our priorities for public spending to upgrade and expand the nation's infrastructure, we can heighten the productivity of our workforce and improve the competitive position of the United States in the increasingly competitive international marketplace.

Infrastructure Investment Results in Productivity Gains

A Federal Reserve Bank of Philadelphia study by Geralde R. Carlino further identifies infrastructure investment as a source of productivity gains to private industry. Carlino notes that the size of a city significantly affects the productivity of workers in private industry, and that growing municipalities that neglect public facilities will lose their competitive advantage.[28]

The study shows that as more companies move into a city, the productivity of each firm increases because of "agglomeration economies." This is a type of economy of scale that is external to a firm, and results from having a number of firms in the same industry in a city, or from the size of the city itself.

Public Infrastructure Investment Relative to Private Investment in Plant and Equipment 1953 — 1985



An example of "agglomeration economies" is found in the grouping of computer industry firms in California's Silicon Valley, Boston's Route 128, North Carolina's Research Triangle, and Philadelphia's Route 202. This clustering effect quickly attracts support firms, financial services, and a pool of highly qualified workers. Productivity is increased as a result.

However, productivity gains are choked off when growth without infrastructure investment brings traffic congestion and creates inflation. If city planners fail to resolve the problems of congestion as a city grows, then firms will find their cost of doing business in that city increasing. In this sense, Carlino warns, public infrastructure and private capital work together to increase local production.

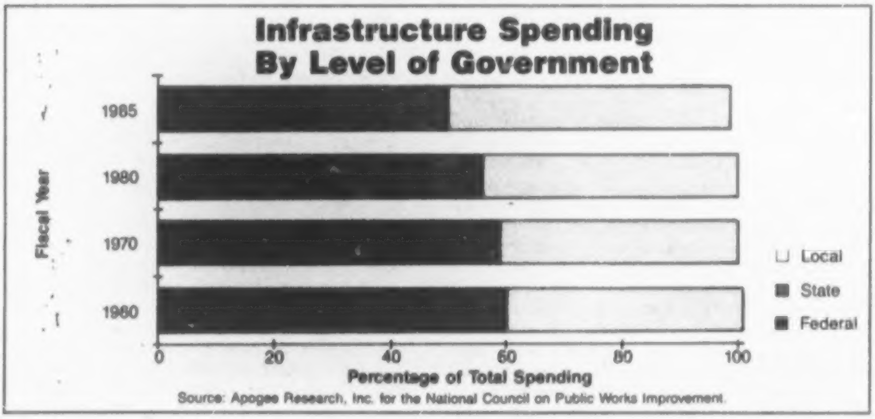
Carlino's model shows that in Peoria, Illinois, with a population of almost half a million, a company would nearly double its productivity rate by doubling its raw material, work force, and production. But in Philadelphia, the nation's fourth largest metropolitan area with nearly five million people, the result would be no productivity gain at all.

Carlino states that the productivity gains from city size may not be fully tapped if the city cannot accommodate the growth which agglomeration economies spur. Insufficient investment in public infrastructure, such as roads, bridges, sewers, and public transportation systems, as well as schools and universities, could halt the growth of an area. After some point, additional public infrastructure is necessary for future growth to occur.

The Link Between Infrastructure Investment and Manufacturing Productivity

In another recent study, Randall Eberts at the Federal Reserve Bank of Cleveland measured the level of public infrastructure for 38 metropolitan places for the years 1958-1981.[32] Eberts also considers public infrastructure as an element, together with labor and private capital, in a citywide manufacturing production function. While his method of estimation does not give particulars about specific cities, Eberts finds that a doubling of public infrastructure would lead to a 4 percent increase in manufacturing output, on average, in his sample of 38 metropolitan places.

Public leaders at all levels of government need to recognize the fact that large cities have existed and will continue to exist, at least in part because they tend to make workers and other factors of production more productive. Planners need to recognize the fact that city size does matter to the rate of economic growth achievable, for if infrastructure and schools are either allowed to remain as they are or to decay, they will fail to realize the "agglomeration economies" and productivity gains which cities provide.



Infrastructure Spending By Level of Government

RECENT TREND TOWARD "SUBURBANIZATION" OF JOBS INCREASES NEED FOR INFRASTRUCTURE INVESTMENT

Not all regions appear organized to handle the task of tackling the immense infrastructure problems facing their communities. Some light can be shed on the difficulties in addressing the infrastructure crisis by looking at recent patterns of growth.

Since 1950 metropolitan growth has been primarily suburban, with 86 percent of population growth occurring in the suburbs. As a result, the suburbs, with only 23 percent of the population in 1950, accounted for 44 percent by 1984, while central city shares have remained relatively constant. By 1980, almost half of the U.S. population, 108 million people, lived in 35 areas of over 1 million. Over one-third of the population lived in metropolitan areas of over 2.5 million persons.

The suburbanization of jobs has followed the suburbanization of population. Commuting growth has concentrated in the suburbs, as between 1960 and 1980 the suburbs received about two-thirds of all metropolitan job growth. In 1960, American suburbs contained 14 million jobs, representing about 35 percent of jobs measured by worker trips. By 1980 the number of jobs in the suburbs had more than doubled to about 33 million, representing about 47 percent of all metropolitan job destinations.

The U.S. metropolitan suburbs now have about 60 percent of metropolitan workers and are receiving about 67 percent of job growth. This not only suggests a continuing shift of development toward the suburbs, but also greater balance in the suburbs between workers and jobs.

According to the recent study "Commuting in America"[30]:

- Average travel times for all commuters have reached about 21 minutes for a typical journey of only 10 miles, indicating an average commuting speed of only 28 miles per hour.
- Nationally, public transit travel times are now about twice those of the private vehicle. In large, high transit use metropolitan areas, average transit travel times are 1.7 to 1.8 times the travel time of private vehicles.
- Part of the attraction of work travel to the suburbs has been that present lower suburban densities make suburban travel speeds on some routes better than suburb-to-center city speeds. But, generally low road capacity can quickly shift speeds downward as commuting growth occurs.

In Long Island, highways, already the most crowded in the New York metropolitan area, will become even more congested. Studies show that by the year 2000 many roads there could experience stop-and-go traffic 15 hours a day.[31]

The suburbs are indeed growing. *Time* magazine has termed them "megacounties" — a form of urban organization — that is so new that demographers have not yet coined an acceptable name for them. Outside almost every major American city, one or more counties are developing the characteristics of sprawling, increasingly dense suburbs.[32]

Gwinnett County, Georgia, 18 miles outside of Atlanta, has seen its population quadruple from 72,300 in 1970 to 250,000 in 1987. Oakland County, near Detroit, has received 40 percent of all jobs created in Michigan since 1982. Tysons Corner, an unincorporated area of Fairfax County 13 miles from downtown Washington, D.C. now contains more office space than either Baltimore or downtown Miami.

These changes are having a profound impact on society, wreaking havoc with roads and transportation. The shift also calls into question the ability of local governments, working independently and with limited resources, to cope. For example, metropolitan Atlanta has 53 separate governments, and Denver has about 50. Du Page County, Illinois, adjacent to Chicago-O'Hare International Airport, has climbed to a population of 700,000 governed by 35 municipalities, nine townships, and many more special districts (fire districts, sanitary districts, and school districts).

As the megacounties are straining to meet infrastructure challenges, old-line central cities are having a difficult time without an expanding tax base. Added to this is the recent withdrawal of certain federal assistance programs, such as revenue-sharing which made up 25 percent of federal assistance to municipalities and restrictions on tax-exempt bond financing passed by Congress in the Tax Reform Act of 1986.

Strapped governments are now asking developers and businesses to pay for more of their own improvements. Not long ago, Southbury, Connecticut would have offered tax abatements and a package of services to attract an employer with 2,500 jobs. Now, a new corporate resident such as International Business Machines Corp., will spend millions to improve local roads and build its own sewage-treatment plant.[33]

A National League of Cities survey conducted in 1987 polled 545 cities and towns, including the nation's largest 25 cities, found that cities and towns are increasingly unable to meet infrastructure needs. Fifty-two percent of the respondents said that they have cut capital spending in 1987.[34]

OTHER COUNTRIES — EXAMPLES FOR THE U.S.?

How have other nations addressed their infrastructure needs in this era of international competitiveness? Are there lessons for the U.S. in their policies?

Germany and Japan both use a five-year public sector program that includes infrastructure, and the plan is closely linked to the public budget to assure a continuous approach to infrastructure funding.[35]

Other governments realize that infrastructure investment is a proper and continuing responsibility of the national government. In Germany, the federal government plays a guiding role in development of infrastructure policy, with state and local governments generally determining actual projects and implementing them. Local governments are most closely involved in local road maintenance, public transit, sewage, water, electricity, housing construction, and related projects. In fact, two-thirds of Germany's public investment decisions are made by local governments, with financial assistance and loans from the states.

The Australian states derive most of their revenue from unconditional federal grants negotiated periodically by federal and state policymakers. In the not-so-distant past, the Canadian provinces also received powerful revenue raising assistance from Ottawa in the form of tax credits that permitted the provinces to re-enter the income tax field after World War II at virtually no political risk to their elected leaders — an innovative federal-state tax sharing program.

Japan is clearly going the extra mile to ensure that industry has an environment conducive to growth. Under its ambitious "Technopolis" plan, Japan intends to create nineteen high-technology industrial complexes by 1990. Each "Technopolis" will integrate high-tech industry with a university or research institute and pleasant residential areas designed to attract engineers and researchers.[36]

Each locality will be responsible for developing its own Technopolis program, including selection of a site; identification of goals; planning, construction, and maintenance of industrial land, water service, housing, and roads; and creation of a legal body to facilitate financing for businesses and other services needed for industrial development.

Once government approves a locality's plan, it provides wide-ranging assistance such as favorable tax-depreciation allowances, business financing, and construction of needed infrastructure.

CONCLUSION — INCREASING INFRASTRUCTURE INVESTMENT WILL HELP MAKE AMERICA'S ECONOMY COMPETITIVE AGAIN!

Former Secretary of Labor William Brock, in a review of the nation's economic problems called "Competing Takes Hard Work," recalls the old comic strip in which Pogo once said, "We have met the enemy, and he is us."[3]

For the past 20 years, America has chosen to neglect infrastructure investments, and we have paid the economic price in terms of lost productivity and unrealized economic growth. As a result, the economic problems facing this nation are now enormous, and the trade deficit can no longer be ignored.

In searching for solutions to the nation's enormous trade problems, we cannot afford to ignore the one solution — investment in our roads, bridges, water and sewer works, dams, ports, schools, and public buildings — that will enable this country to reap economic growth rewards and become competitive once again; but first, we must provide the infrastructure foundations for growth. Otherwise, instead of increased productivity, we will only spend more and more due to inefficiency and congestion, and risk tying up our nation's economic future in one vast, unproductive traffic jam.

APPENDIX

The National Council on Public Works Improvement's
REPORT CARD ON THE NATION'S PUBLIC WORKS

Subject Category	Grade	Successes/ Recent Changes	Problems/ Future Weaknesses
HIGHWAYS	C+	Federal and state gas tax increases have injected new capital into the system. This, along with increased O&M spending, has improved pavement conditions. However, quality of service in terms of congestion is declining.	Spending for system expansion has fallen short of need in high-growth urban and suburban areas. Many roadways and bridges are aging and require major work. Needs of most rural and smaller systems exceed available resources. Highway Trust Fund has a sizeable cash balance.
MASS TRANSIT	C-	Federal capital grants have helped improve quality of service in some areas, but overall productivity of the system has declined significantly. Growth of transit vehicles is double the rate of increase in ridership. Diverting people from cars is increasingly difficult.	Mass transit is overcapitalized in many smaller cities and inadequate in large, older cities. Systems rarely are linked to land-use planning and broader transportation goals. Maintenance has been erratic and inadequate, especially in older cities.
AVIATION	B-	In general, the aviation system has handled rapid increases in demand safely and effectively. However, service has begun to decline in the face of increasing airport and airspace congestion as a result of strong traffic growth. The air traffic control system is currently undergoing a $16 billion modernization.	Congestion is the system's primary problem. Despite recent increases in authorizations, sizeable cash balance remains unspent in the Airport and Airway Trust Fund. The air traffic control system needs substantial upgrading to maintain safety.
WATER RESOURCES	B	Water Resources Act of 1986 made cost-sharing mandatory for many types of water projects. This change should improve project selection and reduce overall project costs.	Cost-sharing will improve efficiency but also increase local costs of water projects. Poorer communities may find it difficult to finance projects. Implementation is often excessively slow and cumbersome.
WATER SUPPLY	B-	While regional performance varies, water supply stands out as an effective, locally-operated program. Strict new standards created by the 1986 Safe Drinking Water Act will require drastic increases in water rates over the next decade.	Many public water systems suffer from pricing below costs, inability to meet purity standards, or source contamination. Storage and distribution systems are deteriorating in some older cities and supplies are limited in some parts of the West and several cities along the East coast.
WASTEWATER	C	Over 75% of U.S. population is served by secondary treatment plants. Shift from federal grants to state revolving loans may improve efficiency of plant construction. Broadened focus on nonpoint source pollution and groundwater contamination may accelerate progress toward cleaner water.	Despite $44 billion federal investment in sewage treatment since 1972, water quality has not improved significantly. This is due in part to uncontrolled sources of pollution, such as run-off from farmland and roadways. Overall productivity of secondary treatment facilities is declining, resulting in an increase in water quality violations.
SOLID WASTE	C-	Testing and monitoring of solid waste facilities are more rigorous as a result of tougher environmental standards. Waste-to-energy technology is growing as alternative to landfills. More aggressive waste reduction, separation, and recycling efforts are beginning at the local level. However, few states have moved boldly on these measures.	Nation faces significant costs of adequate and safe facilities. Limited data suggest trends toward fewer but safer landfills, rapid growth in resource recovery, and little progress toward waste reduction. Public opposition to siting all types of facilities is a major problem.
HAZARDOUS WASTE	D	Funding for site clean-up has increased five-fold since 1986, but progress has been slower than expected. Only a small fraction of the two tons of waste per capita produced in America each year is being treated safely. Major challenge is still ahead of us.	Nation has forfeited much of its opportunity to reduce waste before it is produced. Waste control legislation promotes "end-of-pipe" rather than source reduction solutions. Congressional mandates and schedules may be overly optimistic, given administrative resources. A massive backlog of poisons and needed cleanup projects faces the nation.

ALABAMA Infrastructure Facts

Alabama's infrastructure is the network of public facilities -- roads, bridges, public buildings, prisons, sewers and wastewater treatment facilities, water supply facilities, dams, and other public works -- that Americans rely on every day to provide the foundation for economic activity and our quality of life. Many of these facilities are inadequate to meet current needs and are in a deteriorating condition. Here is a sampling of Alabama's infrastructure needs.

CLEAN WATER NEEDS IN ALABAMA

- The Environmental Protection Agency has estimated the capital costs needed to build the publicly-owned municipal wastewater treatment facilities required to comply with the Clean Water Act. EPA computes the investment needed between now and the year 2008 for two situations: first, to meet the needs of the current state population, and secondly, to meet the needs when the state's anticipated population growth through 2008 is taken into account.

PUBLIC WASTEWATER TREATMENT NEEDS IN ALABAMA, 1988 THROUGH 2008 (Millions of Dollars)

	Secondary Treatment	Advanced Treatment	Infiltration/ Inflow Correction	Replacement/ Rehabilitation	New Collector Sewers	New Interceptor Sewers	Combined Sewer Overflow	TOTAL
Needs (with no population growth)	$168	$66	$93	$18	$116	$86	0	$547
Needs (with population growth)	232	92	93	18	152	194	0	781

U.S. Environmental Protection Agency

- Over just the next five years, 28 projects must be built to bring Alabama's municipalities into compliance with water quality standards mandated by the Clean Water Act, at a cost of $23.5 million, according to a survey by the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA). To remain in compliance with these standards, in the next five years 69 **additional** projects must be funded at a cost of $130.0 million.

HAZARDOUS WASTE SITES IN ALABAMA

- In Alabama 6.52 million metric tons of hazardous waste were generated in 1986 -- 2.5 % of all hazardous waste generated in the U.S. that year.

- The Environmental Protection Agency has placed 10 Alabama sites on the National Priorities List for Superfund cleanup. An additional 2 sites located in Alabama (also listed below) are proposed for addition to the Superfund List.

SUPERFUND NATIONAL PRIORITIES LIST SITES IN ALABAMA

Site Name	City/County	
Alabama Army Ammunitions Plant	Childersburg	
Anniston Army Depot (Southeast Industrial Area)	Anniston	
Ciba-Geigy Corp. (McIntosh Plant)	McIntosh	
Interstate lead Co. (ILCO)	Leeds	
Mowbray Engineering Co.	Greenville	
Olin Corp. (McIntosh Plant)	McIntosh	
Perdido Ground Water Contamination	Perdido	
Redwing Carriers, Inc.	Saraland	*Proposed*
Stauffer Chemical Co. (Cold Creek Plant)	Bucks	
Stauffer Chemical Co. (LeMoyne Plant)	Axis	
T.H. Agriculture & Nutrition Co. (Montgomery Plant)	Montgomery	*Proposed*
Triana/Tennessee River	Limestone/Morgan	

U.S. Environmental Protection Agency, National Priorities List, July, 1989

HIGHWAY NEEDS IN ALABAMA

- In Alabama, 19 percent, or 4,694 miles, of all paved rural highway miles in the state are rated as **deficient** under the Federal Highway Administration pavement conditions rating system; that is, the pavement is in "poor" condition and is therefore in need of resurfacing, rehabilitation, or reconstruction. An additional 581 miles in the state are unpaved rural roads.

- Ten percent, or 460 miles, of urban highways and streets in Alabama are rated **deficient**.

- These statistics do not include local streets and roads. The highway classifications represented in the following tables cover only 5 percent of the total road mileage in Alabama, but carry over 80 percent of the state's travel.

ALABAMA'S DEFICIENT ROADWAY MILES

RURAL

	Interstate	Other Principal Arterial	Minor Arterial	Major Collector	Minor Collector	TOTAL
1987	1	47	210	2,471	2,635	5,364
1988	1	38	191	1,980	2,484	4,694

1988	None	None	30	167	263	460

Federal Highway Administration

ALABAMA'S DEFICIENT BRIDGES

- Alabama has a total of 15,413 bridges, of which 7,248 (47 percent) are either structurally deficient or functionally obsolete (meaning the bridge is inadequate for current loads and traffic).

- Thirty-seven percent of Alabama's highway bridges on the federal-aid system are deficient, as are 60 percent of the bridges on state and local roads off the federal aid system.

NUMBER OF DEFICIENT BRIDGES IN ALABAMA - JUNE, 1989

	Bridges in Inventory	Structurally Deficient Bridges	Functionally Obsolete Bridges	Total Deficient Bridges	Percent Deficient
On Highways Eligible for Federal Aid	7,708	830	2,049	2,879	37
On State or Local Roads	7,705	2,642	1,727	4,369	60
ALABAMA TOTAL	15,413	3,472	3,776	7,248	47

Highway Bridge Replacement and Rehabilitation Program, 1990.

ALABAMA'S AIR TRANSPORTATION SYSTEM NEEDS

- The U.S. Department of Transportation has developed an integrated plan for airport development and expansion to meet the nation's needs for both commercial and general aviation through the year 1995. For the nation as a whole, air traffic is expected to grow 5 percent annually through 1995.

ALABAMA AIRPORT CAPITAL NEEDS (Millions of Dollars)

	1986-1990	1991-1995
Airport Needs	$114.6	$74.0

Secretary of Transportation Report to Congress, National Plan of Integrated Airport Systems (NPIAS): 1986-1995, November, 1987.

ALASKA Infrastructure Facts

Alaska's infrastructure is the network of public facilities -- roads, bridges, public buildings, prisons, sewers and wastewater treatment facilities, water supply facilities, dams, and other public works -- that Americans rely on every day to provide the foundation for economic activity and our quality of life. Many of these facilities are inadequate to meet current needs and are in a deteriorating condition. Here is a sampling of Alaska's infrastructure needs.

CLEAN WATER NEEDS IN ALASKA

- The Environmental Protection Agency has estimated the capital costs needed to build the publicly-owned municipal wastewater treatment facilities required to comply with the Clean Water Act. EPA computes the investment needed between now and the year 2008 for two situations: first, to meet the needs of the current state population, and secondly, to meet the needs when the state's anticipated population growth through 2008 is taken into account.

PUBLIC WASTEWATER TREATMENT NEEDS IN ALASKA, 1988 THROUGH 2008 (Millions of Dollars)

	Secondary Treatment	Advanced Treatment	Infiltration/ Inflow Correction	Replacement/ Rehabilitation	New Collector Sewers	New Interceptor Sewers	Combined Sewer Overflow	TOTAL
Needs (with no population growth)	$46	0	$5	0	$19	$37	0	$107
Needs (with population growth)	94	0	5	0	19	103	0	221

U.S. Environmental Protection Agency

- Over just the next five years, 39 projects must be built for Alaska's municipalities to remain in compliance with water quality standards mandated by the Clean Water Act, at a cost of $83.6 million, according to a survey by the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA).

HAZARDOUS WASTE SITES IN ALASKA

- In Alaska 45,900 million tons of hazardous waste were generated in 1986.
- The Environmental Protection Agency has placed 1 Alaska site on the National Priorities List for Superfund cleanup. An additional 4 sites located in Alaska (also listed below) are proposed for addition to the Superfund list.

SUPERFUND NATIONAL PRIORITIES LIST SITES IN ALASKA

Highway Bridge Replacement and Rehabilitation Program, 1990.

CALIFORNIA'S AIR TRANSPORTATION SYSTEM NEEDS

- The U.S. Department of Transportation has developed an integrated plan for airport development and expansion to meet the nation's needs for both commercial and general aviation through the year 1995. For the nation as a whole, air traffic is expected to grow 5 percent annually through 1995.

CALIFORNIA AIRPORT CAPITAL NEEDS (Millions of Dollars)

	1986-1990	1991-1995
Airport Needs	$1,086.8	$534.8

Secretary of Transportation Report to Congress, National Plan of Integrated Airport Systems (NPIAS): 1986-1995, November, 1987.

HAZARDOUS WASTE SITES IN CALIFORNIA

- In California 16.15 million metric tons of hazardous waste were generated in 1986 -- 6.2 % of all hazardous waste generated in the U.S. that year.

- The Environmental Protection Agency has placed 52 California sites on the National Priorities List for Superfund cleanup. An additional 46 sites located in California (also listed below) are proposed for addition to the Superfund List.

SUPERFUND NATIONAL PRIORITIES LIST SITES IN CALIFORNIA

Site Name	City/County	
Advanced Micro Devices, Inc. (Building 915)	Sunnyvale	*Proposed*
Advanced Micro Devices, Inc.	Sunnyvale	
Aerojet General Corp.	Rancho Cordova	
Applied Materials	Santa Clara	
Atlas Asbestos Mine	Fresno County	
Barstow Marine Corps Logistics Base (Nebo Area)	Barstow	*Proposed*
Beckman Instruments (Porterville Plant)	Porterville	
Brown & Bryant, Inc. (Arvin Plant)	Arvin	*Proposed*
Camp Pendleton Marine Corps Base	San Diego County	*Proposed*
Castle Air Foce Base	Merced	
Celtor Chemical Works	Hoopa	
Coalinga Asbestos Mine	Coalinga	
Coast Wood Preserving	Ukiah	
Concord Naval Weapons Station	Concord	*Proposed*
Crazy Horse Sanitary Landfill	Salinas	*Proposed*
CTS Printex, Inc.	Mountain View	*Proposed*
Del Norte Pesticide Storage	Crescent City	
Edwards Air Force Base	Kern County	*Proposed*
El Toro Marine Corps Air Station	El Toro	*Proposed*
Fairchild Semiconductor Corp. (Mountain View Plant)	Mountain View	*Proposed*
Fairchild Semiconductor Corp. (South San Jose Plant)	South San Jose	*Proposed*

SUPERFUND NATIONAL PRIORITIES LIST SITES IN CALIFORNIA (Continued)

Site Name	City/County	
Firestone Tire & Rubber Co. (Salinas Plant)	Salinas	
FMC Corp. (Fresno Plant)	Fresno	*Proposed*
Fort Ord	Marina	*Proposed*
Fresno Municipal Sanitary Landfill	Fresno	*Proposed*
GBF, Inc. Dump	Antioch	*Proposed*
George Air Force Base	Victorville	*Proposed*
Hewlett-Packard	Palo Alto	*Proposed*
Hewlett-Packard (620-640 Page Mill Road)	Palo Alto	*Proposed*
Hexcel Corp.	Livermore	*Proposed*
IBM Corp. (San Jose Plant)	San Jose	*Proposed*
Intel Corp. (Mountain View Plant)	Mountain View	
Intel Corp. (Santa Clara III)	Santa Clara	
Intel Magnetics	Santa Clara	
Intersil Inc./Siemens Components	Cupertino	*Proposed*
Iron Mountain Mine	Redding	
J.H. Baxter & Co.	Weed	*Proposed*
Jasco Chemical Corp.	Mountain View	*Proposed*
Jibboom Junkyard	Sacramento	
Kaiser Steel Corp. (Fontana Plant)	Fontana	*Proposed*
Kearney-KPF	Stockton	*Proposed*
Koppers Co., Inc., (Oroville Plant)	Oroville	
Lawrence Livermore National Laboratory (USDOE)	Livermore	
Liquid Gold Oil Corp.	Richmond	
Lorentz Barrel & Drum Co.	San Jose	*Proposed*
Louisiana-Pacific Corp.	Oroville	
March Air Force Base	Riverside	*Proposed*
Marley Cooling Tower Co.	Stockton	*Proposed*
Mather Air Force Base (AC & W Disposal Site)	Sacramento	
McClellan Air Force Base (Ground Water Contamination)	Sacramento	
McColl	Fullerton	
MGM Brakes	Cloverdale	
Modesto Ground Water Contamination	Modesto	
Moffett Naval Air Station	Sunnyvale	
Monolithic Memories	Sunnyvale	
Montrose Chemical Corp.	Torrance	*Proposed*
National Semiconductor Corp.	Santa Clara	
Newmark Ground Water Contamination	San Bernardino	
Norton Air Force Base	San Bernardino	
Operating Industries, Inc., Landfill	Monterey Park	
Pacific Coast Pipe Lines	Fillmore	*Proposed*
Purity Oil Sales, Inc.	Malaga	
Raytheon Corp.	Mountain View	
Rhone-Poulenc, Inc./Zoecon Corp.	East Palo Alto	*Proposed*
Riverbank Army Depot	Riverbank	*Proposed*
Sacramento Army Depot	Sacramento	
San Fernando Valley (Area 1)	Los Angeles	
San Fernando Valley (Area 2)	Los Angeles/Glendale

San Gabriel Valley (Area 4)	La Puente	
Selma Treating Co.	Selma	
Sharpe Army Depot	Lathrop	
Signetics, Inc.	Sunnyvale	*Proposed*
Sola Optical USA, Inc.	Petaluma	*Proposed*
Solvent Service, Inc.	San Jose	*Proposed*
South Bay Asbestos Area	Alviso	
Southern California Edison Co. (Visalia Poleyard)	Visalia	
Southern Pacific Transportation	Roseville	*Proposed*
Spectra-Physics, Inc.	Mountain View	*Proposed*
Stringfellow	Glen Avon Heights	
Sulphur Bank Mercury Mine	Clear Lake	*Proposed*
Synertek, Inc. (Building 1)	Santa Clara	*Proposed*
T.H. Agriculture & Nutrition Co.	Fresno	
Teledyne Semiconductor	Mountain View	
Tracy Defense Depot	Tracy	*Proposed*
Travis Air Force Base	Solano County	*Proposed*
Treasure Island Naval Station	San Francisco	*Proposed*
TRW Microwave, Inc. (Building 825)	Sunnyvale	*Proposed*
Valley Wood Preserving, Inc.	Turlock	
Van Waters & Rogers, Inc.	San Jose	*Proposed*
Waste Disposal, Inc.	Santa Fe Springs	
Watkins-Johnson Co. (Stewart Division)	Scotts Valley	*Proposed*
Westinghouse Electric Corp. (Sunnyvale Plant)	Sunnyvale	

U.S. Environmental Protection Agency, National Priorities List, July, 1989

COLORADO Infrastructure Facts

***Colorado's infrastructure* is the network of public facilities -- roads, bridges, public buildings, prisons, sewers and wastewater treatment facilities, water supply facilities, dams, and other public works -- that Americans rely on every day to provide the foundation for economic activity and our quality of life. Many of these facilities are inadequate to meet current needs and are in a deteriorating condition. Here is a sampling of Colorado's infrastructure needs.**

CLEAN WATER NEEDS IN COLORADO

- The Environmental Protection Agency has estimated the capital costs needed to build the publicly-owned municipal wastewater treatment facilities required to comply with the Clean Water Act. EPA computes the investment needed between now and the year 2008 for two situations: first, to meet the needs of the current state population, and secondly, to meet the needs when the state's anticipated population growth through 2008 is taken into account.

PUBLIC WASTEWATER TREATMENT NEEDS IN COLORADO, 1988 THROUGH 2008 (Millions of Dollars)

	Secondary Treatment	Advanced Treatment	Infiltration/ Inflow Correction	Replacement/ Rehabilitation	New Collector Sewers	New Interceptor Sewers	Combined Sewer Overflow	TOTAL
Needs (with no population growth)	$56	$66	$2	$7	$4	$28	0	$163
Needs (with population growth)	75	69	2	7	4	39	0	196

U.S. Environmental Protection Agency

- Over just the next five years, 61 projects must be built for Colorado's municipalities **to remain in compliance** with water quality standards mandated by the Clean Water Act, at a cost of $100.4 million, according to a survey by the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA). This is in addition to 1 project required at a cost of $0.3 million to bring Colorado into compliance initially.

HAZARDOUS WASTE SITES IN COLORADO

- In Colorado 1.50 million metric tons of hazardous waste were generated in 1986 -- 0.6% of all hazardous waste generated in the U.S. that year.

- The Environmental Protection Agency has placed 13 Colorado sites on the National Priorities List for Superfund cleanup. An additional 4 sites located in Colorado (also listed below) are proposed for addition to the Superfund List.

SUPERFUND NATIONAL PRIORITIES LIST SITES IN COLORADO

Site Name	City/County	
Air Force Plant PJKS	Waterton	*Proposed*
Broderick Wood Products	Denver

Rocky Mountain Arsenal	Adams County	
Sand Creek Industrial	Commerce City	
Smuggler Mountain	Pitkin County	
Uravan Uranium Project (Union Carbide Corp.)	Uravan	
Woodbury Chemical Co.	Commerce City	

U.S. Environmental Protection Agency, National Priorities List, July, 1989

HIGHWAY NEEDS IN COLORADO

- In Colorado, 8 percent, or 1,033 miles, of all paved rural highway miles in the state are roads rated as deficient in 1988 under the Federal Highway Administration pavement conditions rating system; that is, the pavement is in "poor" condition and is therefore in need of resurfacing, rehabilitation, or reconstruction. An additional 10,449 miles in the state are unpaved rural roads.
- Nine percent, or 309 miles, of urban highways and streets in Colorado are rated deficient.
- These statistics do not include local streets and roads. The highway classifications represented in the following tables cover only 36 percent of Colorado's road and street mileage, but carry over 84 percent of the state's travel.

COLORADO'S DEFICIENT ROADWAY MILES

RURAL

GEORGIA Infrastructure Facts

Georgia's infrastructure is the network of public facilities -- roads, bridges, public buildings, prisons, sewers and wastewater treatment facilities, water supply facilities, dams, and other public works -- that Americans rely on every day to provide the foundation for economic activity and our quality of life. Many of these facilities are [illegible] are in a deteriorating condition. Here is a sampling of Georgia's infrastructure needs.

CLEAN WATER NEEDS IN GEORGIA

- The Environmental Protection Agency has estimated the capital costs needed to build the publicly-owned municipal wastewater treatment facilities required to comply with the Clean Water Act. EPA computes the investment needed between now and the year 2008 for two situations: first, to meet the needs of the current state population, and secondly, to meet the needs when the state's anticipated population growth through 2008 is taken into account.

PUBLIC WASTEWATER TREATMENT NEEDS IN GEORGIA, 1988 THROUGH 2008 (Millions of Dollars)

	Secondary Treatment	Advanced Treatment	Infiltration/ Inflow Correction	Replacement/ Rehabilitation	New Collector Sewers	New Interceptor Sewers	Combined Sewer Overflow	TOTAL
Needs (with no population growth)	$169	$89	$44	$26	$56	$151	$80	$615
Needs (with population growth)	307	129	44	26	82	339	80	1007

U.S. Environmental Protection Agency

- Over just the next five years, 151 projects must be built for Georgia's municipalities to remain in compliance with water quality standards mandated by the Clean Water Act, at a cost of $627.0 million, according to a survey by the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA).

HAZARDOUS WASTE SITES IN GEORGIA

- In Georgia 3.24 million metric tons of hazardous waste were generated in 1986 -- 1.2 % of all hazardous waste generated in the U.S. that year.

- The Environmental Protection Agency has placed 7 Georgia sites on the National Priorities List for Superfund cleanup. An additional 7 sites located in Georgia (also listed below) are proposed for addition to the Superfund List.

HIGHWAY NEEDS IN GEORGIA

- In Georgia, 14 percent, or 4,002 miles, of all paved rural highway miles in the state are rated as deficient under the Federal Highway Administration pavement conditions rating system; that is, the pavement is in "poor" condition and is therefore in need of resurfacing, rehabilitation, or reconstruction. An additional 1,793 miles in the state are unpaved rural roads.

- Ten percent, or 572 miles, of urban highways and streets in Georgia are rated deficient.

- These statistics do not include local streets and roads. The highway classifications represented in the following tables cover only 34 percent of Georgia's road and street mileage, but carry over 85 percent of the state's travel.

GEORGIA'S DEFICIENT ROADWAY MILES

IOWA Infrastructure Facts

Iowa's infrastructure is the network of public facilities – roads, bridges, public buildings, prisons, sewer and wastewater treatment facilities, water supply facilities, dams, and other public works – that Americans rely on every day to provide the [illegible] for [illegible] activity and our quality of life. Many of these facilities are [illegible] condition. Here is a summary of Iowa's infrastructure needs.

CLEAN WATER NEEDS IN IOWA

- The Environmental Protection Agency has estimated the capital costs needed to build the publicly-owned municipal wastewater treatment facilities required to comply with the Clean Water Act. EPA computes the investment needed between now and the year 2008 for two situations: first, to meet the needs of the current state population, and secondly, to meet the needs when the state's anticipated population growth through 2008 is taken into account.

PUBLIC WASTEWATER TREATMENT NEEDS IN IOWA, 1988 THROUGH 2008 (Millions of Dollars)

	Secondary Treatment	Advanced Treatment	Infiltration/ Inflow Correction	Replacement/ Rehabilitation	New Collector Sewers	New Interceptor Sewers	Combined Sewer Overflow	TOTAL
Needs (with no population growth)	$221	$51	$50	$2	$38	$144	$5	$511
Needs (with population growth)	256	55	50	2	42	236	5	646

U.S. Environmental Protection Agency

- Over just the next five years, 20 projects must be built to bring Iowa's municipalities into compliance with water quality standards mandated by the Clean Water Act, at a cost of $20.0 million, according to a survey by the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA). To remain in compliance with these standards, in the next five years 50 additional projects must be funded at a cost of $50.0 million.

HIGHWAY NEEDS IN IOWA

- In Iowa, 2 percent, or 620 miles, of all paved rural highway miles in the state are rated as deficient under the Federal Highway Administration pavement conditions rating system; that is, the pavement is in "poor" condition and is therefore in need of resurfacing, rehabilitation, or reconstruction. An additional 13,499 miles in the state are unpaved rural roads.

- Twelve percent, or 392 miles, of urban highways and streets in Iowa are rated deficient.

- These statistics do not include local streets and roads. The highway classifications represented in the following tables cover only 37 percent of Iowa's road and street mileage, but carry over 87 percent of the state's travel.

IOWA'S DEFICIENT ROADWAY MILES

RURAL

	Interstate	Other Principal Arterial	Minor Arterial	Major Collector	Minor Collector	TOTAL
1987	86	143	270	156	56	711

1988	15	None	235	58	84	392

Federal Highway Administration

IOWA'S DEFICIENT BRIDGES

- Iowa has a total of 25,708 bridges, of which 11,943 (47 percent) are either structurally deficient or functionally obsolete (meaning the bridge is inadequate for current loads and traffic).

- Twenty-five percent of Iowa's highway bridges on the federal-aid system are deficient, as are 55 percent of the bridges on state and local roads off the federal aid system.

NUMBER OF DEFICIENT BRIDGES IN IOWA - JUNE, 1989

	Bridges in Inventory	Structurally Deficient Bridges	Functionally Obsolete Bridges	Total Deficient Bridges	Percent Deficient
On Highways Eligible for Federal Aid	7,220	703	1,107	1,810	25
On State or Local Roads	18,488	5,078	5,055	10,133	55
IOWA TOTAL	25,708	5,781	6,162	11,943	47

Highway Bridge Replacement and Rehabilitation Program, 1990.

IOWA'S AIR TRANSPORTATION SYSTEM NEEDS

- The U.S. Department of Transportation has developed an integrated plan for airport development and expansion to meet the nation's needs for both commercial and general aviation through the year 1995. For the nation as a whole, air traffic is expected to grow 5 percent annually through 1995.

IOWA AIRPORT CAPITAL NEEDS (Millions of Dollars)

	1986-1990	1991-1995
Airport Needs	$166.9	$39.3

Secretary of Transportation Report to Congress, National Plan of Integrated Airport Systems (NPIAS): 1986-1995, November, 1987.

HAZARDOUS WASTE SITES IN IOWA

- In Iowa 1.85 million metric tons of hazardous waste were generated in 1986 -- 0.7 % of all hazardous waste generated in the U.S. that year.

- The Environmental Protection Agency has placed 9 Iowa sites on the National Priorities List for Superfund cleanup. An additional 16 sites located in Iowa (also listed below) are proposed for addition to the Superfund List.

SUPERFUND NATIONAL PRIORITIES LIST SITES IN IOWA

PUBLIC WASTEWATER TREATMENT NEEDS IN MARYLAND, 1988 THROUGH 2008 (Millions of Dollars)

	Secondary Treatment	Advanced Treatment	Infiltration/ Inflow Correction	Replacement/ Rehabilitation	New Collector Sewers	New Interceptor Sewers	Combined Sewer Overflow	TOTAL
Needs (with no population growth)	$168	$395	$40	0	$49	$205	$9	$866
Needs (with population growth)	183	408	40	0	56	223	9	919

U.S. Environmental Protection Agency

- Over just the next **five** years, 79 projects must be built for Maryland's municipalities **to remain in compliance** with water quality standards mandated by the Clean Water Act, at a cost of $806.4 million, according to a survey by the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA).

HAZARDOUS WASTE SITES IN MARYLAND

- **In Maryland 2.98 million metric tons of hazardous waste were generated in 1986 -- 1.1 % of all hazardous waste generated in the U.S. that year.**

- The Environmental Protection Agency has placed 7 Maryland sites on the National Priorities List for Superfund cleanup. An additional 3 sites located in Maryland (also listed below) are proposed for addition to the Superfund List.

SUPERFUND NATIONAL PRIORITIES LIST SITES IN MARYLAND

Site Name	City/County	
Aberdeen Proving Ground (Edgewood Area)	Edgewood	*Proposed*
Aberdeen Proving Ground (Michaelsville Landfill)	Aberdeen	*Proposed*
Anne Arundel County Landfill	Glen Burnie	*Proposed*

HIGHWAY NEEDS IN MARYLAND

- In Maryland, 6 percent, or 331 miles, of all paved rural highway miles in the state are rated as **deficient** under the Federal Highway Administration pavement conditions rating system; that is, the pavement is in "poor" condition and is therefore in need of resurfacing, rehabilitation, or reconstruction. An additional 29 miles in the state are unpaved rural roads.

- Six percent, or 212 miles, of urban highways and streets in Maryland are rated **deficient**.

- These statistics do not include local streets and roads. The highway classifications represented in the following tables cover only 32 percent of Maryland's road and street mileage, but carry over 92 percent of the state's travel.

MARYLAND'S DEFICIENT ROADWAY MILES

MARYLAND'S AIR TRANSPORTATION SYSTEM NEEDS

- The U.S. Department of Transportation has developed an integrated plan for airport development and expansion to meet the nation's needs for both commercial and general aviation through the year 1995. For the nation as a whole, air traffic is expected to grow 5 percent annually through 1995.

MARYLAND AIRPORT CAPITAL NEEDS (Millions of Dollars)

	1986-1990	1991-1995
Airport Needs	[illegible]	$20.8

Secretary of Transportation Report to Congress, National Plan of Integrated Airport Systems (NPIAS): 1986-1995, November, 1987.

MASSACHUSETTS Infrastructure Facts

Massachusetts' infrastructure is the network of public facilities -- roads, bridges, public buildings, prisons, sewers and wastewater treatment facilities, water supply facilities, dams, and other public works -- that Americans rely on every day to provide the foundation for economic activity and our quality of life. Many of these facilities are inadequate to meet current needs and are in a deteriorating condition. Here is a sampling of Massachusetts's infrastructure needs.

CLEAN WATER NEEDS IN MASSACHUSETTS

- The Environmental Protection Agency has estimated the capital costs needed to build the publicly-owned municipal wastewater treatment facilities required to comply with the Clean Water Act. EPA computes the investment needed between now and the year 2008 for two situations: first, to meet the needs of the current state population, and secondly, to meet the needs when the state's anticipated population growth through 2008 is taken into account.

PUBLIC WASTEWATER TREATMENT NEEDS IN MASSACHUSETTS, 1988 THROUGH 2008 (Millions of Dollars)

	Secondary Treatment	Advanced Treatment	Infiltration/ Inflow Correction	Replacement/ Rehabilitation	New Collector Sewers	New Interceptor Sewers	Combined Sewer Overflow	TOTAL
Needs (with no population growth)	$2,466	$15	$40	$18	$574	$618	$1,714	$5,445
Needs (with population growth)	2,526	34	40	18	731	773	1,714	5,836

U.S. Environmental Protection Agency

- Over just the next five years, 4 projects must be built to bring Massachusetts's municipalities into compliance with water quality standards mandated by the Clean Water Act, at a cost of $500.0 million, according to a survey by the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA). To remain in compliance with these standards, in the next five years 116 additional projects must be funded at a cost of $6,400.0 million.

HIGHWAY NEEDS IN MASSACHUSETTS

- In Massachusetts, 16 percent, or 772 miles, of all paved rural highway miles in the state are rated as deficient under the Federal Highway Administration pavement conditions rating system; that is, the pavement is in "poor" condition and is therefore in need of resurfacing, rehabilitation, or reconstruction. An additional 296 miles in the state are unpaved rural roads.
- Five percent, or 420 miles, of urban highways and streets in Massachusetts are rated deficient.
- These statistics do not include local streets and roads. The highway classifications represented in the following tables cover only 38 percent of Massachusetts' road and street mileage, but carry over 92 percent of the state's travel.

MISSISSIPPI'S DEFICIENT BRIDGES

- Mississippi has a total of 16,920 bridges, of which 8,593 (51 percent) are either structurally deficient or functionally obsolete (meaning the bridge is inadequate for current loads and traffic).
- Forty percent of Mississippi's highway bridges on the federal-aid system are deficient, as are 59 percent of the bridges on state and local roads off the federal aid system.

NUMBER OF DEFICIENT BRIDGES IN MISSISSIPPI - JUNE, 1989

	Bridges in Inventory	Structurally Deficient Bridges	Functionally Obsolete Bridges	Total Deficient Bridges	Percent Deficient
On Highways Eligible for Federal Aid	7,601	1,417	1,652	3,069	40
On State or Local Roads	9,319	4,725	799	5,524	59
MISSISSIPPI TOTAL	16,920	6,142	2,451	8,593	51

Highway Bridge Replacement and Rehabilitation Program, 1990.

MISSISSIPPI'S AIR TRANSPORTATION SYSTEM NEEDS

- The U.S. Department of Transportation has developed an integrated plan for airport development and expansion to meet the nation's needs for both commercial and general aviation through the year 1995. For the nation as a whole, air traffic is expected to grow 5 percent annually through 1995.

MISSISSIPPI AIRPORT CAPITAL NEEDS (Millions of Dollars)

	1986-1990	1991-1995
Airport Needs	$63.9	$38.5

Secretary of Transportation Report to Congress, National Plan of Integrated Airport Systems (NPIAS): 1986-1995, November, 1987.

MISSOURI Infrastructure Facts

***Missouri's infrastructure* is the network of public facilities -- roads, bridges, public buildings, prisons, sewers and wastewater treatment facilities, water supply facilities, dams, and other public works -- that Americans rely on every day to provide the foundation for economic activity and our quality of life. Many of these facilities are inadequate to meet current needs and are in a deteriorating condition. Here is a sampling of Missouri's infrastructure needs.**

CLEAN WATER NEEDS IN MISSOURI

- The Environmental Protection Agency has estimated the capital costs needed to build the publicly-owned municipal wastewater treatment facilities required to comply with the Clean Water Act. EPA computes the investment needed between now and the year 2008 for two situations: first, to meet the needs of the current state population, and secondly, to meet the needs when the state's anticipated population growth through 2008 is taken into account.

PUBLIC WASTEWATER TREATMENT NEEDS IN MISSOURI, 1988 THROUGH 2008 (Millions of Dollars)

	Secondary Treatment	Advanced Treatment	Infiltration/ Inflow Correction	Replacement/ Rehabilitation	New Collector Sewers	New Interceptor Sewers	Combined Sewer Overflow	TOTAL
Needs (with no population growth)	$425	$1	$10	$70	$54	$252	$143	$955
Needs (with population growth)	514	1	10	70	67	417	143	1,222

U.S. Environmental Protection Agency

- Over just the next **five** years, 2 projects must be built to bring Missouri's municipalities **into compliance** with water quality standards mandated by the Clean Water Act, at a cost of $300.0 million, according to a survey by the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA). To **remain in compliance** with these standards, in the next five years 19 **additional** projects must be funded at a cost of $105.0 million.

HIGHWAY NEEDS IN MISSOURI

- In Missouri, 12 percent, or 3,671 miles, of all paved rural highway miles in the state are rated as **deficient** under the Federal Highway Administration pavement conditions rating system; that is, the pavement is in "poor" condition and is therefore in need of resurfacing, rehabilitation, or reconstruction.
- Twenty-five percent, or 1,138 miles, of urban highways and streets in Missouri are rated **deficient.**
- These statistics do not include local streets and roads. The highway classifications represented in the following tables cover only 30 percent of Missouri's road and street mileage, but carry over 90 percent of the state's travel.

MISSOURI'S DEFICIENT ROADWAY MILES

NEW MEXICO Infrastructure Facts

New Mexico's infrastructure is the network of public facilities -- roads, bridges, public buildings, prisons, sewers and wastewater treatment facilities, water supply facilities, dams, and other public works -- that Americans rely on every day to provide the foundation for economic activity and our quality of life. Many of these facilities are inadequate to meet current needs and are in a deteriorating condition. Here is a sampling of New Mexico's infrastructure needs.

CLEAN WATER NEEDS IN NEW MEXICO

- The Environmental Protection Agency has estimated the capital costs needed to build the publicly-owned municipal wastewater treatment facilities required to comply with the Clean Water Act. EPA computes the investment needed between now and the year 2008 for two situations: first, to meet the needs of the current state population, and secondly, to meet the needs when the state's anticipated population growth through 2008 is taken into account.

PUBLIC WASTEWATER TREATMENT NEEDS IN NEW MEXICO, 1988 THROUGH 2008 (Millions of Dollars)

	Secondary Treatment	Advanced Treatment	Infiltration/ Inflow Correction	Replacement/ Rehabilitation	New Collector Sewers	New Interceptor Sewers	Combined Sewer Overflow	TOTAL
Needs (with no population growth)	$53	0	$1	$16	$8	$14	0	$92
Needs (with population growth)	55	0	1	16	31	27	0	130

U.S. Environmental Protection Agency

- Over just the next five years, 31 projects must be built for New Mexico's municipalities to remain in compliance with water quality standards mandated by the Clean Water Act, at a cost of $65.0 million, according to a survey by the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA).

HAZARDOUS WASTE SITES IN NEW MEXICO

- In New Mexico 555,500 metric tons of hazardous waste were generated in 1986 – 0.2 % of all hazardous waste generated in the U.S. that year.

- The Environmental Protection Agency has placed 6 New Mexico sites on the National Priorities List for Superfund cleanup. An additional 4 sites located in New Mexico (also listed below) are proposed for addition to the Superfund List.

HIGHWAY NEEDS IN NORTH DAKOTA

- In North Dakota, 3 percent, or 286 miles, of rural highway miles in the state are rated as **deficient** under the Federal Highway Administration pavement conditions rating system; that is, the pavement is in "poor" condition and is therefore in need of resurfacing, rehabilitation, or reconstruction. An additional 13,470 miles in the state are unpaved.

- Nine percent, or 58 miles, of urban highways and streets in North Dakota are rated **deficient.**

- These statistics do not include local streets and roads. The highway classifications represented in the following tables cover only 29 percent of North Dakota's road and street mileage, but carry over 83 percent of the state's travel.

NORTH DAKOTA'S DEFICIENT ROADWAY MILES

RURAL

	Interstate	Other Principal Arterial	Minor Arterial	Major Collector	Minor Collector	TOTAL
1987	142	48	392	110	None	692
1988	185	39	62	None	None	286

1987	4	None	29	None	1	34
1988	19	None	7	10	22	58

Federal Highway Administration

NORTH DAKOTA'S DEFICIENT BRIDGES

- North Dakota has a total of 5,231 bridges, of which 2,986 (57 percent) are either structurally deficient or functionally obsolete (meaning the bridge is inadequate for current loads and traffic).

- Forty percent of North Dakota's highway bridges on the federal-aid system are deficient, as are 66 percent of the bridges on state and local roads off the federal aid system.

NUMBER OF DEFICIENT BRIDGES IN NORTH DAKOTA - JUNE, 1989

	Bridges in Inventory	Structurally Deficient Bridges	Functionally Obsolete Bridges	Total Deficient Bridges	Percent Deficient
On Highways Eligible for Federal Aid	1,781	149	551	700	40
On State or Local Roads	3,450	1,741	545	2,286	66
NORTH DAKOTA TOTAL	5,231	1,890	1,096	2,986	57

Highway Bridge Replacement and Rehabilitation Program, 1990.

NORTH DAKOTA'S AIR TRANSPORTATION SYSTEM NEEDS

- The U.S. Department of Transportation has developed an integrated plan for airport development and expansion to meet the nation's needs for both commercial and general aviation through the year 1995. For the nation as a whole, air traffic is expected to grow 5 percent annually through 1995.

NORTH DAKOTA AIRPORT CAPITAL NEEDS (Millions of Dollars)

	1986-1990	1991-1995
Airport Needs	$51.2	$60.6

Secretary of Transportation Report to Congress, National Plan of Integrated Airport Systems (NPIAS): 1986-1995, November, 1987.

OHIO Infrastructure Facts

Ohio's infrastructure is the network of public facilities -- roads, bridges, public buildings, prisons, sewers and wastewater treatment facilities, water supply facilities, dams, and other public works -- that Americans rely on every day to provide the foundation for economic activity and our quality of life. Many of these facilities are inadequate to meet current needs and are in a deteriorating condition. Here is a sampling of Ohio's infrastructure needs.

CLEAN WATER NEEDS IN OHIO

- The Environmental Protection Agency has estimated the capital costs needed to build the publicly-owned municipal wastewater treatment facilities required to comply with the Clean Water Act. EPA computes the investment needed between now and the year 2008 for two situations: first, to meet the needs of the current state population, and secondly, to meet the needs when the state's anticipated population growth through 2008 is taken into account.

PUBLIC WASTEWATER TREATMENT NEEDS IN OHIO, 1988 THROUGH 2008 (Millions of Dollars)

	Secondary Treatment	Advanced Treatment	Infiltration/ Inflow Correction	Replacement/ Rehabilitation	New Collector Sewers	New Interceptor Sewers	Combined Sewer Overflow	TOTAL
Needs (with no population growth)	$577	$317	$278	$61	$565	$759	$584	$3,141
Needs (with population growth)	725	359	278	61	672	900	584	3,579

U.S. Environmental Protection Agency

- Over just the next **five** years, 40 projects must be built to bring Ohio's municipalities **into compliance** with water quality standards mandated by the Clean Water Act, at a cost of $71.0 million, according to a survey by the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA). To **remain in compliance** with these standards, in the next five years 185 **additional** projects must be funded at a cost of $440.0 million.

HIGHWAY NEEDS IN OHIO

- In Ohio, 11 percent, or 2,666 miles, of paved rural highway miles in the state are rated as **deficient** under the Federal Highway Administration pavement conditions rating system; that is, the pavement is in "poor" condition and is therefore in need of resurfacing, rehabilitation, or reconstruction. An additional 696 miles in the state are unpaved.
- Ten percent, or 969 miles, of urban highways and streets in Ohio are rated **deficient**.
- These statistics do not include local streets and roads. The highway classifications represented in the following tables cover 31 percent of Ohio's road and street mileage, but carry over 78 percent of the state's travel.

OHIO'S DEFICIENT ROADWAY MILES

RURAL

	Interstate	Other Principal Arterial	Minor Arterial	Major Collector	Minor Collector	TOTAL

	1986-1990	1991-1995
Airport Needs	$405.9	$202.3

Secretary of Transportation Report to Congress, National Plan of Integrated Airport Systems (NPIAS): 1986-1995, November, 1987.

HAZARDOUS WASTE SITES IN OHIO

- In Ohio 18.72 million metric tons of hazardous waste were generated in 1986 -- 7.2 % of all hazardous waste generated in the U.S. that year.

- The Environmental Protection Agency has placed 29 Ohio sites on the National Priorities List for Superfund cleanup. An additional 5 sites located in Ohio (also listed below) are proposed for addition to the Superfund List.

SUPERFUND NATIONAL PRIORITIES LIST SITES IN OHIO

Site Name	City/County	
Allied Chemical & Ironton Coke	Ironton	
Alsco Anaconda	Gnadenhutten	
Arcanum Iron & Metal	Darke County	
Big D Campground	Kingsville	
Bowers Landfill	Circleville	
Buckeye Reclamation	St. Clairsville	
Chem-Dyne	Hamilton	
Coshocton Landfill	Franklin Township	
E.H. Schilling Landfill	Hamilton Township	
Feed Materials Production Center (U.S. DOE)	Fernald	*Proposed*
Fields Brook	Ashtabula	
Fultz Landfill	Jackson Township	
General Electric Co. (Coshocton Plant)	Coshocton	*Proposed*

SUPERFUND NATIONAL PRIORITIES LIST SITES IN OHIO (Continued)

Site Name	City/County	
Industrial Excess Landfill	Uniontown	
Laskin/Poplar Oil Co.	Jefferson Township	
Miami County Incinerator	Troy	
Mound Plant (U.S. DOE)	Miamisburg	*Proposed*
Nease Chemical	Salem	
New Lyme Landfill	New Lyme	
Old Mill	Rock Creek	
Ormet Corp.	Hannibal	
Powell Road Landfill	Dayton	
Pristine, Inc.	Reading	
Reilly Tar & Chemical Corp. (Dover Plant)	Dover	*Proposed*
Republic Steel Corp. Quarry	Elyria	
Sanitary Landfill Co. (Industrial Waste Disposal Co., Inc.)	Dayton	
Skinner Landfill	West Chester	
South Point Plant	South Point	
Summit National	Deerfield Township	
TRW, Inc. (Minerva Plant)	Minerva	
United Scrap Lead Co., Inc.	Troy	
Van Dale Junkyard	Marietta	
Wright-Patterson Air Force Base	Dayton	*Proposed*
Zanesville Well Field	Zanesville

RHODE ISLAND Infrastructure Facts

Rhode Island's infrastructure is the network of public facilities -- roads, bridges, public buildings, prisons, sewers and wastewater treatment facilities, water supply facilities, dams, and other public works -- that Americans rely on every day to provide the foundation for economic activity and our quality of life. Many of these facilities are inadequate to meet current needs and are in a deteriorating condition. Here is a sampling of Rhode Island's infrastructure needs.

CLEAN WATER NEEDS IN RHODE ISLAND

- The Environmental Protection Agency has estimated the capital costs needed to build the publicly-owned municipal wastewater treatment facilities required to comply with the Clean Water Act. EPA computes the investment needed between now and the year 2008 for two situations: first, to meet the needs of the current state population, and secondly, to meet the needs when the state's anticipated population growth through 2008 is taken into account.

PUBLIC WASTEWATER TREATMENT NEEDS IN RHODE ISLAND, 1988 THROUGH 2008 (Millions of Dollars)

	Secondary Treatment	Advanced Treatment	Infiltration/ Inflow Correction	Replacement/ Rehabilitation	New Collector Sewers	New Interceptor Sewers	Combined Sewer Overflow	TOTAL
Needs (with no population growth)	$16	$4	0	0	$76	$62	$206	$364
Needs (with population growth)	37	4	0	0	91	70	206	408

U.S. Environmental Protection Agency

- Over just the next five years, 25 projects must be built for Rhode Island's municipalities to remain in compliance with water quality standards mandated by the Clean Water Act, at a cost of $63.4 million, according to a survey by the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA).

HAZARDOUS WASTE SITES IN RHODE ISLAND

- In Rhode Island 1.52 million metric tons of hazardous waste were generated in 1986 -- 0.6 % of all hazardous waste generated in the U.S. that year.

- The Environmental Protection Agency has placed 8 Rhode Island sites on the National Priorities List for Superfund cleanup. An additional 3 sites located in Rhode Island (also listed below) are proposed for addition to the Superfund List.

SUPERFUND NATIONAL PRIORITIES LIST SITES IN RHODE ISLAND

Site Name	City/County	
Central Landfill	Johnston	
Davis (GSR) Landfill	Glocester	
Davis Liquid Waste	Smithfield	
Davisville Naval Construction Battalion Center	North Kingstown	*Proposed*
Landfill & Resource Recovery, Inc. (L&RR)	North Smithfield	
Newport Naval Education & Training Center	Newport	*Proposed*

Stamina Mills, Inc.	North Smithfield	
Western Sand & Gravel	Burrillville	

U.S. Environmental Protection Agency, National Priorities List, July, 1989

HIGHWAY NEEDS IN RHODE ISLAND

- In Rhode Island, 38 percent, or 197 miles, of rural highway miles in the state are rated as **deficient** under the Federal Highway Administration pavement conditions rating system; that is, the pavement is in "poor" condition and is therefore in need of resurfacing, rehabilitation, or reconstruction. An additional 2 miles in the state are unpaved.

- Twenty-three percent, or 280 miles, of urban highways and streets in Rhode Island are rated **deficient**.

- These statistics do not include local streets and roads. The highway classifications represented in the following tables cover only 30 percent of Rhode Island's road and street mileage, but carry over 89 percent of the state's travel.

RHODE ISLAND'S DEFICIENT ROADWAY MILES

RURAL

	Interstate	Other Principal Arterial	Minor Arterial	Major Collector	Minor Collector	TOTAL

Federal Highway Administration

RHODE ISLAND'S DEFICIENT BRIDGES

- Rhode Island has a total of 697 bridges, of which 133 (19 percent) are either structurally deficient or functionally obsolete (meaning the bridge is inadequate for current loads and traffic).

- Sixteen percent of Rhode Island's highway bridges on the federal-aid system are deficient, as are 32 percent of the bridges on state and local roads off the federal aid system.

NUMBER OF DEFICIENT BRIDGES IN RHODE ISLAND - JUNE, 1989

	Bridges in Inventory	Structurally Deficient Bridges	Functionally Obsolete Bridges	Total Deficient Bridges	Percent Deficient
On Highways Eligible for Federal Aid	561	64	25	89	16
On State or Local Roads	136	26	18	44	32
RHODE ISLAND TOTAL	697	90	43	133	19

Highway Bridge Replacement and Rehabilitation Program, 1990.

RHODE ISLAND'S AIR TRANSPORTATION SYSTEM NEEDS

- The U.S. Department of Transportation has developed an integrated plan for airport development and expansion to meet the nation's needs for both commercial and general aviation through the year 1995. For the nation as a whole, air traffic is expected to grow 5 percent annually through 1995.

RHODE ISLAND AIRPORT CAPITAL NEEDS (Millions of Dollars)

	1986-1990	1991-1995
Airport Needs	$23.8	$12.9

Secretary of Transportation Report to Congress, National Plan of Integrated Airport Systems (NPIAS): 1986-1995, November, 1987.

SOUTH CAROLINA Infrastructure Facts

South Carolina's infrastructure is the network of public facilities – roads, bridges, public buildings, prisons, sewers and wastewater treatment facilities, water supply facilities, dams, and other public works – that Americans rely on every day to provide the foundation for economic activity and our quality of life. Many of these facilities are inadequate to meet current needs and are in a deteriorating condition. Here is a sampling of South Carolina's infrastructure needs.

CLEAN WATER NEEDS IN SOUTH CAROLINA

- The Environmental Protection Agency has estimated the capital costs needed to build the publicly-owned municipal wastewater treatment facilities required to comply with the Clean Water Act. EPA computes the investment needed between now and the year 2008 for two situations: first, to meet the needs of the current state population, and secondly, to meet the needs when the state's anticipated population growth through 2008 is taken into account.

PUBLIC WASTEWATER TREATMENT NEEDS IN SOUTH CAROLINA, 1988 THROUGH 2008 (Millions of Dollars)

	Secondary Treatment	Advanced Treatment	Infiltration/ Inflow Correction	Replacement/ Rehabilitation	New Collector Sewers	New Interceptor Sewers	Combined Sewer Overflow	TOTAL
Needs (with no population growth)	$168	$23	$21	0	$76	$153	0	$441
Needs (with population growth)	260	32	21	0	99	272	0	684

U.S. Environmental Protection Agency

- Over just the next five years, 1 project must be built to bring South Carolina's municipalities into compliance with water quality standards mandated by the Clean Water Act, at a cost of $1.0 million, according to a survey by the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA). To remain in compliance with these standards, in the next five years 114 additional projects must be funded at a cost of $290.4 million.

HIGHWAY NEEDS IN SOUTH CAROLINA

- In South Carolina, 4 percent, or 704 miles, of paved rural highway miles in the state are rated as deficient under the Federal Highway Administration pavement conditions rating system; that is, the pavement is in "poor" condition and is therefore in need of resurfacing, rehabilitation, or reconstruction. An additional 93 miles are unpaved.

- Two percent, or 49 miles, of urban highways and streets in South Carolina are rated deficient.

- These statistics do not include local streets and roads. The highway classifications represented in the following tables cover 33 percent of South Carolina's road and street mileage, but carry over 91 percent of the state's travel.

Needs (with population growth)	397	65	39	4	31	47	0	583

U.S. Environmental Protection Agency

- Over just the next five years, 39 projects must be built for Utah's municipalities to **remain in compliance** with water quality standards mandated by the Clean Water Act, at a cost of $77.9 million, according to a survey by the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA).

HAZARDOUS WASTE SITES IN UTAH

- In Utah 965,500 metric tons of hazardous waste were generated in 1986 -- 0.4 % of all hazardous waste generated in the U.S. that year.

- The Environmental Protection Agency has placed 5 Utah sites on the National Priorities List for Superfund cleanup. An additional 7 sites located in Utah (also listed below) are proposed for addition to the Superfund List.

SUPERFUND NATIONAL PRIORITIES LIST SITES IN UTAH

Site Name	City/County	
Hill Air Force Base	Ogden

UTAH'S AIR TRANSPORTATION SYSTEM NEEDS

- The U.S. Department of Transportation has developed an integrated plan for airport development and expansion to meet the nation's needs for both commercial and general aviation through the year 1995. For the nation as a whole, air traffic is expected to grow 5 percent annually through 1995.

UTAH AIRPORT CAPITAL NEEDS (Millions of Dollars)

	1986-1990	1991-1995
Airport Needs	$119.8	$93.4

Secretary of Transportation Report to Congress, National Plan of Integrated Airport Systems (NPIAS): 1986-1995, November, 1987.

VERMONT Infrastructure Facts

***Vermont's infrastructure* is the network of public facilities -- roads, bridges, public buildings, prisons, sewers and wastewater treatment facilities, water supply facilities, dams, and other public works -- that Americans rely on every day to provide the foundation for economic activity and our quality of life. Many of these facilities are inadequate to meet current needs and are in a deteriorating condition. Here is a sampling of Vermont's infrastructure needs.**

CLEAN WATER NEEDS IN VERMONT

- The Environmental Protection Agency has estimated the capital costs needed to build the publicly-owned municipal wastewater treatment facilities required to comply with the Clean Water Act. EPA computes the investment needed between now and the year 2008 for two situations: first, to meet the needs of the current state population, and secondly, to meet the needs when the state's anticipated population growth through 2008 is taken into account.

PUBLIC WASTEWATER TREATMENT NEEDS IN VERMONT, 1988 THROUGH 2008 (Millions of Dollars)

	Secondary Treatment	Advanced Treatment	Infiltration/ Inflow Correction	Replacement/ Rehabilitation	New Collector Sewers	New Interceptor Sewers	Combined Sewer Overflow	TOTAL
Needs (with no population growth)	$63	$28	$1	$4	$16	$16	$74	$202
Needs (with population growth)	65	29	1	4	20	16	. 74	209

U.S. Environmental Protection Agency

- Over just the next **five** years, 5 projects must be built to bring Vermont's municipalities **into compliance** with water quality standards mandated by the Clean Water Act, at a cost of $10.0 million, according to a survey by the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA). To **remain in compliance** with these standards, in the next five years 20 **additional** projects must be funded at a cost of $46.1 million.

HAZARDOUS WASTE SITES IN VERMONT

- In Vermont 217,000 metric tons of hazardous waste were generated in 1986 -- 0.1 % of all hazardous waste generated in the U.S. that year.

- The Environmental Protection Agency has placed 4 Vermont sites on the National Priorities List for Superfund cleanup. An additional 4 sites located in Vermont (also listed below) are proposed for addition to the Superfund List.

Needs (with population growth)	582	198	56	2	180	159	222	1,399

U.S. Environmental Protection Agency

- Over just the next five years, 152 projects must be built for Wisconsin's municipalities to **remain in compliance** with water quality standards mandated by the Clean Water Act, at a cost of $625.0 million, according to a survey by the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA).

HIGHWAY NEEDS IN WISCONSIN

- In Wisconsin, 12 percent, or 3,393 miles, of paved rural highway miles in the state are rated as **deficient** under the Federal Highway Administration pavement conditions rating system; that is, the pavement is in "poor" condition and is therefore in need of resurfacing, rehabilitation, or reconstruction. An additional 195 miles in the state are unpaved.

- Fifteen percent, or 672 miles, of urban highways and streets in Wisconsin are rated **deficient**.

- These statistics do not include local streets and roads. The highway classifications represented in the following tables cover only 31 percent of Wisconsin's road and street mileage, but carry over 81 percent of the state's travel.

WISCONSIN'S DEFICIENT ROADWAY MILES

RURAL

	Interstate	Other Principal Arterial	Minor Arterial	Major Collector	Minor Collector	TOTAL
1987	129	211	426	1,959	578	3,303
1988	116	218	486	1,893	680	3,393

Federal Highway Administration

WISCONSIN'S DEFICIENT BRIDGES

- Wisconsin has a total of 12,995 bridges, of which 5,158 (40 percent) are either structurally deficient or functionally obsolete (meaning the bridge is inadequate for current loads and traffic).

- Thirty-one percent of Wisconsin's highway bridges on the federal-aid system are deficient, as are 48 percent of the bridges on state and local roads off the federal aid system.

NUMBER OF DEFICIENT BRIDGES IN WISCONSIN - JUNE, 1989

	Bridges in Inventory	Structurally Deficient Bridges	Functionally Obsolete Bridges	Total Deficient Bridges	Percent Deficient
On Highways Eligible for Federal Aid	6,389	1,614	388	2,002	31
On State or Local Roads	6,606	2,225	931	3,156	48

WYOMING Infrastructure Facts

Wyoming's infrastructure is the network of public facilities -- roads, bridges, public buildings, prisons, sewers and wastewater treatment facilities, water supply facilities, dams, and other public works -- that Americans rely on every day to provide the foundation for economic activity and our quality of life. Many of these facilities are inadequate to meet current needs and are in a deteriorating condition. Here is a sampling of Wyoming's infrastructure needs.

CLEAN WATER NEEDS IN WYOMING

- The Environmental Protection Agency has estimated the capital costs needed to build the publicly-owned municipal wastewater treatment facilities required to comply with the Clean Water Act. EPA computes the investment needed between now and the year 2008 for two situations: first, to meet the needs of the current state population, and secondly, to meet the needs when the state's anticipated population growth through 2008 is taken into account.

PUBLIC WASTEWATER TREATMENT NEEDS IN WYOMING, 1988 THROUGH 2008 (Millions of Dollars)

	Secondary Treatment	Advanced Treatment	Infiltration/ Inflow Correction	Replacement/ Rehabilitation	New Collector Sewers	New Interceptor Sewers	Combined Sewer Overflow	TOTAL
Needs (with no population growth)	$8	0	$1	$2	$1	$5	0	$17
Needs (with population growth)	9	0	1	2	1	5	0	18

U.S. Environmental Protection Agency

HAZARDOUS WASTE SITES IN WYOMING

- In Wyoming 494.1 million metric tons of hazardous waste were generated in 1986 -- 0.2 % of all hazardous waste generated in the U.S. that year.
- The Environmental Protection Agency has placed 1 Wyoming site on the National Priorities List for Superfund cleanup. An additional 2 sites located in Wyoming (also listed below) are proposed for addition to the Superfund List.

TO EXAMINE THE FUTURE OF OUR NATION'S INFRASTRUCTURE NEEDS

WEDNESDAY, JUNE 13, 1990

House of Representatives,
Committee on Public Works and Transportation,
Washington, DC.

The committee met, pursuant to call, at 10:00 a.m., in Room 2167, Rayburn House Office Building, Hon. Glenn M. Anderson [chairman of the committee] presiding.

The Chairman. The meeting will please come to order. Before we begin, I will insert into the record at this point a background paper and summary of today's hearing.

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
HEARING: INFRASTRUCTURE AND AMERICA'S ECONOMIC FUTURE
(The Impact of Infrastructure on the Nation's Productivity, Economic Growth and Competitiveness)

WEDNESDAY, JUNE 13, 1990

BACKGROUND

Productivity---the relationship of goods and services produced in the economy compared to the resources, or factors of production, used to produce them---is vital to growth of the American economy and to meet the needs of our society. Over the long term rising productivity is the source for raising real incomes and for providing for a high standard of living. Improving productivity creates and preserves jobs and enables U.S. businesses to compete effectively in world markets.

However, many U. S. industries no longer have the same competitive edge which enabled this country to take the lead in the world's economy. Our trade deficit continues to be very high, giving us the dubious honor of being the world's largest debtor nation. Ironically, much of this occurred during the past 8 years of extraordinary economic expansion.

At the present time, the U.S. probably has the highest labor productivity in the world, but it is questionable how much longer that will last. Last week the Labor Department released new figures indicating that productivity of U. S. non-farm business plunged at an annual rate of 2.7% in the first quarter of this year---the largest drop since the last quarter of 1981, when the Nation was in a deep recession.

The data reflect that most productivity and unit labor cost problems are concentrated in the services sector rather than in manufacturing. However, it also shows that the downward trend in the Nation's productivity growth rate is continuing. This fuels the long-standing concern that the Nation has not been able to show significant productivity growth for several years. A downward revision in productivity often reflects a downturn in the gross national product (GNP), and the Department of Commerce did recently revise its estimate for the first quarter of the year that the GNP grew at an annual rate of 1.3%, adjusted for inflation, instead of 2.1%.

Several possible remedies have been proposed advocating an important role for private capital investment to deal with the Nation's economic problems such as new management techniques, more flexible manufacturing, more education, a focus on research and development, investment in new plant and equipment. However, there is growing consideration over the vital role that capital investment in our public works facilities should play in promoting and enhancing national economic growth.

Economic research in recent years has tied the level of public spending on infrastructure--Federal, State and local--to the productivity growth rate in the private sector. The U.S. productivity growth rate fell from 1.8% annually in the 1960's to 0.7% during the early 1980's. During the same period, the annual growth rate for investment in infrastructure fell from 4.5% to 0.8%.

Our productivity is growing much more slowly than in other developed countries, particularly the so-called Group of Seven nations (Japan, West Germany, Canada, France, Italy, the United Kingdom and the U.S.). West Germany has an impressive growth rate of 2.9% and in Japan, it is 3.1%. These countries also invest almost twice as much in their public works as does the United States. In fact, the U.S. now ranks 55th in the world in capital investment in infrastructure.

There is little doubt that infrastructure investments have historically made a vital contribution to our Nation's economic growth and well-being. Nevertheless, for over 20 years, we have been shortchanging our public works. Total public spending on infrastructure dropped from 3.6% of GNP in 1960 to 2.6% in 1985. Some statistics show a greater drop to a low of 2% of GNP in the early 1980's rebounding to 2.2% by 1987. While spending on operations and maintenance has remained a constant share of GNP, capital spending has dropped from 2.3% of GNP in 1960 to 1.1% today. The relative share of public works spending at all levels of government declined from nearly 20% of total expenditures in 1950 to less than 7% in 1984.

Many economists feel this underinvestment and slow growth rate of our productivity means trouble ahead as other nations, particularly Germany and Japan, surpass us. Among them is Dr. David Aschauer, a senior economist with the Federal Reserve Bank of Chicago and one of today's witnesses. He considers this to be at the heart of our problems with international competitiveness and chronic trade deficits.

Aschauer, one of the economists at the Committee's Roundtable discussion on Infrastructure: Productivity, Growth and Competitiveness in March told Members that he believes there is a strong correlation between public investment in infrastructure and growth in productivity in the private sector. Based on his research, he has determined that infrastructure spending makes private investment in plant and equipment more profitable. He goes further than many by stating that the decline in our productivity growth over the last 20 years is directly related to diminished public capital investment and that infrastructure investment raises the national (private plus public) investment rate.

Aschauer suggests that continued delay in making public works investments will increase costs but acting now will bring enormous benefits. He has concluded that an increase in the level of public investment by one percent of gross output yields a gain in productive growth of about 0.4% per year.

Other economists who participated with Aschauer in the Committee's Roundtable discussion were Dr. Pat Choate, Vice President, Policy Analysis, TRW, Inc. who served as moderator of the panel; Dr. W. David Montgomery, Assistant Director for Natural Resources and Commerce at CBO; Dr. Michael E. Bell, at the Institute for Policy Studies, The Johns Hopkins University; and Dr. Charles R. Hulten, Professor of Economics and the Univeristy of Maryland.

Dr. Choate was one of the first to express concern nationally about the condition of our infrastructure, particularly roads, its importance to the economy, and the need for full information as to the costs of needed action as well as the costs of inaction. He suggests that American leaders consider using Social Security funds to invest in our National infrastructure.

Dr. Montgomery believes that infrastructure contributes to economic growth but points out that there are many causes for the downward trend in our productivity growth rate. He believes that a cost-benefit approach to project selection combined with efficient pricing strategies in using public systems would lead to a more efficient use of our public capital investments generating productivity gains without massive increased spending.

Dr. Bell views the role of transportation in regional economic development as potentially important but points to the need for further research to identify relationships that will allow for more complete analysis of whether investment in transportation infrastructure in a particular area and for particular reasons will lead to increased private sector investment and presumably " economic development".

Dr. Hulten argues that good infrastructure may affect productivity, but only by making one area more attractive to businesses than another area. He sees no strong evidence of a correlation between national productivity and public capital investment.

At a March hearing entitled Our Nation's Infrastructure Needs, the Committee heard testimony which included an analysis of four major studies. (America's Infrastructure - A Plan to Rebuild by Associated General Contractors of America, 1983; Hard Choices prepared for the Joint Economic Committee, 1984; Public Works Infrastructure: Policy Considerations for the 1980's, CBO, 1983; and Fragile Foundations by the National Council on Public Works Improvement, 1988.) All painted a grim picture of the condition of the Nation's infrastructure and its ability to meet the demands of future economic growth and development. Our infrastructure is not only deteriorating due to aging facilities, but underinvestment in new facilities is overburdening current demands. Statistics were provided citing problems with the Nation's highways, bridges, airports, mass transit and wastewater facilities, and included data on the needs within the individual States. Suggestions were made of efforts that should be undertaken, of ways to address levels of infrastructure service and performance, and of dollar goals for investment to meet the country's infrastructure needs.

HEARING AGENDA

The June 13, hearing will provide further insights into infrastructure issues, particularly about the productivity gains to be realized from investment in public works facilities and observations on what affect the condition of our infrastructure has upon American business's ability to compete internationally.

Marvin Runyon, Chairman of the Tennessee Valley Authority (TVA), is expected to discuss regional economic development and productivity improvement resulting from TVA's efforts and investments in public facilities such as roads, airport facilities, water and wastewater treatment and delivery systems, water transportation improvements. As former head of Nissan Motor Manufacturing Corp, U.S.A., Mr. Runyon has experience with global economies and can speak knowledgeably about the U. S. role in international markets.

Witnesses representing the U.S. Chamber of Commerce will be John Bush, Vice President for Governmental Affairs, U.S. Gypsum Co., which is a member of the Chamber, along with Chamber staffer, William D. Kelleher, Manager, Community Resources. Testimony will focus on transportation issues and the impact of problems such as traffic congestion on productivity and the cost of doing business. Mr. Bush will also be able to provide some commentary based on Gypsum's position as a Fortune 100 firm and as the

Nation's largest manufacturer of gypsum wall boards and other building materials requiring shipment to building sites and retail outlets. Mr. Kelleher, has been actively involved in the U. S. Chamber of Commerce effort this year to build awareness of infrastructure needs. He was quoted extensively in an article about infrastructure and competitiveness in the May 21, 1990 edition of Industry Week.

A panel of economists will address the themes of productivity, national growth and public infrastructure.

- David Lewis, Partner-in-Charge at James F. Hickling Management Consultants, Ltd., formerly with CBO, will be moderator and provide an overview of the importance of productivity growth as a key to long-term economic growth and growth in living standards; capital formation as a key to productivity growth; public and private capital matters in productivity growth; and importance of and approaches to public project appraisal.

- Dr. David Aschauer, senior economist with the Federal Reserve Bank of Chicago and senior associate with Apogee Research, will discuss the results of his studies showing the relationship between productivity growth and infrastructure investment and will elaborate on the role of private and public capital. He might also touch on his activity this month, in collaboration with Dr. Richard Mudge of Apogee Research, Inc., in presenting a paper prepared for The American Road and Transportation Builders Association entitled "Enhancing U.S. Competitiveness Through Highway Investment: A Strategy For Economic Growth". The report summarizes the results of economic simulations based on Dr. Aschauer's research to identify potential gains to the entire United States economy. For example, if federal highway spending is increased by $25 billion per year to meet highway capital needs identified by the U. S. Department of Transportation, it would lead to a $250 increase in productivity for each American worker within the first five years of the program's initiation, and a $3,200 increase in annual output per worker within 20 years of the program's onset--in 1990 dollars.

- Dr. Laurits Christensen, President of Christensen Associates in Madison, Wisconsin and formerly a professor at the University of Wisconsin, will speak about measuring the productivity implications of public investment decisions. Dr. Christensen has been involved in work which indicates that the way the merit of infrastructure investment is being judged fails to account for major productivity impacts. That leads to underinvestment and contributes to poor productivity growth.

The CHAIRMAN. Today, the Committee on Public Works and Transportation is meeting to continue its series of events on our Nation's infrastructure. As you will recall, in our first hearing, the committee focused on emerging infrastructure needs.

We learned that today our infrastructure is a system of peril, not pride. Sixty percent of our highways, and 41 percent of our bridges are in need of work. Traffic congestion has increased over 50 percent in the last 10 years.

In our Nation's largest urban areas, 2 billion hours of time are lost annually. If you are delayed 20 minutes each day in rush hour, by the end of your career, you will have wasted two working years.

By the year 2000, traffic delays caused by inadequate roads will cost us $50 billion in lost wages and wasted gasoline.

No new airport has been built in this country since 1974. Many of our urban water systems are over 100 years old, and lose as much water as they move. And countless jobs are being lost.

It is not one segment of our infrastructure or one area of our Nation that is affected. What we face is a national problem of alarming dimensions.

In our second event, an informal roundtable discussion, was a panel of distinguished economists, the committee focused on the impact of infrastructure on productivity, growth and competitiveness in the United States. We learned that economic research in recent years has tied the level of public spending on infrastructure—Federal, State and local—to the productivity growth rate in the private sector.

In the United States, productivity growth rate fell from 1.8 percent annually in the 1960s to 0.7 percent during the early 1980s. During the same period, the annual growth rate for investment in infrastructure fell from 4.5 percent to 0.8 percent.

Our productivity is growing much more slowly than in other developed countries, such as Japan, West Germany, Canada, France, Italy, and the United Kingdom. West Germany has an impressive growth rate of 2.9 percent and in Japan it is 3.1 percent. These countries also invest almost twice as much in their public works as does the United States. In fact, the United States now ranks 55th in the world in capital investment in infrastructure.

There is little doubt that infrastructure investments have historically made a vital contribution to our Nation's economic growth and well-being. Nevertheless, for over 20 years we have been shortchanging our public works. Total public spending on infrastructure dropped from 3.6 percent of Gross National Product in 1960 to 2.6 percent in 1985, and the relative share of public works spending at all levels of the government declined from nearly 20 percent of total expenditures in 1950 to less than 7 percent in 1984.

Today's hearing will provide further insight into the economic gains to be realized from investment in public works facilities and what effects the condition of our infrastructure has upon American businesses' ability to compete internationally.

We need answers to some fairly straightforward but significant questions. First, what impact does infrastructure have on our economic productivity? Second, does increased infrastructure spending automatically mean increased productivity? Are other nations doing things in the area of infrastructure that we aren't?

Is there a direct linkage between our ability to compete internationally and infrastructure investment? What factors or principle should be applied to national infrastructure legislation to help promote productivity, growth, and competitiveness in the United States?

Today, as we continue the debate, of how to deal with the present and future needs of our Nation's public works, we hope to get the answers to these and other questions.

And I believe Mr. Hammerschmidt has an opening statement.

Mr. HAMMERSCHMIDT. Yes, I do, Mr. Chairman, thank you.

Mr. Chairman, I commend you for scheduling this hearing on such a timely and important topic; namely, the impact of infrastructure upon our Nation's productivity and economic growth, and join you in welcoming the witnesses appearing before us today.

I would like to extend a special welcome to the Honorable Marvin Runyon, Chairman of the Tennessee Valley Authority. Chairman Runyon has extensive national and international business experience, having served as a Vice President with Ford Motor Corporation and President and CEO of Nissan Motor Manufacturing Corporation, U.S.A.

For the last several years, Chairman Runyon has applied his vast knowledge to improve operations and services at the TVA, which has long been involved with regional development and infrastructure facilities in the areas it serves.

The insight Chairman Runyon has gained over the years into the relationship of infrastructure to the economy as well as that of all of the witnesses appearing today should prove instructive to the committee as we strive to understand this important yet complicated link.

The decisions we make today about how to sustain and improve America's infrastructure not only affect us but our children and grandchildren. Prudence demands that before acting, we give long and careful consideration to all facets of the infrastructure issue. One very important face is how our country's economy impacts and is impacted by our infrastructure system.

In the committee's March hearing on infrastructure needs, we repeatedly heard about the importance of infrastructure to this country's economic well-being.

How closely is the level of investment in and condition of our infrastructure facilities tied to levels of productivity and growth? How can the economic benefits to be gained be better quantified and used to guide future infrastructure investment decisions? These are among the issues we will be discussing today.

Over the past couple of decades, the preeminence of the United States in the world economy has slipped as we have experienced increased competition from Japan and Western Europe.

These pressures will continue through the 1990s as the Japanese and other Pacific Rim economies continue to expand and trade barriers within Western Europe fall. Competition will also grow as England becomes linked by surface transportation to the rest of Europe, and Germany, with its vast economic resources, is reunified.

Additionally, the potential exists for increased competition from Eastern Europe. While Eastern European economies have long been hampered by both political restrictions and deficient infrastructure facilities, those economies are opening and beginning to make improvements and could well pose an additional challenge to the United States' share of the world market.

To meet all of the challenges it will face, the United States' economy must be healthy and functioning at an optimum level. Infrastructure investment is but one contributor to such a viable economy, but a very important one nonetheless.

I look forward today to hearing testimony that will help us improve our understanding of the contributions that infrastructure investment makes to the economy. Hopefully such understanding will lead to a better, higher quality infrastructure system in the future.

Mr. Chairman, I might say I note in the audience, and I notice on our witness list, a friend of mine, John Bush, Vice President of Government Affairs of the U.S. Gypsum Corporation. I am delighted that he is with us today, and look forward also to hearing from him.

Thank you.

The **Chairman**. Thank you.

I have an opening statement by Congressman Costello, and he would like to have it inserted in the record. Is there objection? If not, so ordered.

[The prepared statement of Mr. Costello follows:]

STATEMENT OF U.S. REPRESENTATIVE JERRY COSTELLO, ILLINOIS

Mr. Chairman, I am pleased to be here today to hear testimony on the relationship between the state of our nation's infrastructure and the productivity of our economy. This is the most recent in a series of hearings held by this Committee on this crucial subject, and I look forward to the further insights to be provided by our expert witnesses.

We have heard before of the strong link between competitiveness and infrastructure. It is a matter of common sense: traffic congestion reduces the amount of time American workers can spend in productive employment; businesses cannot grow without adequate facilities, etc. In light of this link, we should be especially concerned that the United States ranks 55th in the world in investment in infrastructure. Unfortunately, we are on a downward trend; public spending on infrastructure has dropped from 3.6% of our gross national product in 1960 to 2.6% of the GNP in 1985. The transportation policy recently proposed by the Bush Administration does not suggest a reversal of this trend.

A strong infrastructure is necessary for local growth. In my own Congressional District, which is located in Southwestern Illinois, it is my hope that the new MetroLink system will aid residents in getting to work in St. Louis without increasing traffic congestion. Similarly, I am hopeful that Scott Air Force Base can be expanded for civilian use to help reduce the burden on our nation's congested airways. We are fortunate to have received funds to repair the structurally deficient Clark Bridge, one of many throughout the country which are in a dangerous state of disrepair.

I hope that this hearing will increase awareness of the importance of rebuilding our roads, bridges, airways and water systems. I look forward to hearing from our witnesses, and I thank you, Mr. Chairman, for continuing to exercise leadership on this important issue.

The **Chairman**. Do any other members have opening statements they wish to make? Mr. Clement?

Mr. **Clement**. Thank you.

Mr. Chairman, I would like to commend you for calling this hearing to examine the economy effects of infrastructure investment.

In the recently released report, "Moving America", Secretary Samuel Skinner wrote:

> The efficiency and competitiveness of transportation providers are essential to economic growth and productivity and the ability of the United States to compete in the world market.

The condition of our infrastructure is clearly connected with our Nation's economic vitality. Since 1960, much of America's drop of productivity has occurred as investment in our infrastructure has fallen approximately 50 percent as a percentage of GNP.

Since 1970, Mr. Chairman, traffic has grown five times faster than highway capacity. And this will only grow worse. The old adage, "time is money", is a good example of what we are talking about here. A worker delayed just 10 minutes each way during 45 years of commuting wastes the equivalent of two working years. According to the U.S. Chamber of Commerce, traffic delays caused by inadequate roads will cost the U.S. $50 billion a year in lost wages and wasted gas.

Our Nation faces a formidable challenge, Mr. Chairman. Unless we as a Nation commit ourselves to rehabilitating our infrastructure, an enormous portion of U.S. economic growth will be lost.

Today, our committee will have the distinct pleasure of hearing from the Chairman of the Tennessee Valley Authority, Mr. Marvin Runyon. Chairman Runyon was designated the ninth Chairman of the TVA Board of Directors by President Reagan and took the oath of office on January 25, 1988.

Prior to becoming TVA Chairman, Mr. Runyon served as President and Chief Executive Officer of Nissan Motor Manufacturing Corporation. Under his leadership, Nissan's Smyrna, Tennessee operation was called by Fortune Magazine the 10 best-managed manufacturing plants in the United States.

Mr. Runyon is uniquely qualified to discuss the impact of infrastructure on our Nation's economic productivity, growth and competitiveness. I might also say that I served on the TVA Board of Directors for two and a half years, and it was a great experience for me to have the opportunity to serve on the TVA Board. We served seven States. It is the largest electric utility in the Nation.

Thank you.

The CHAIRMAN. Mr. Packard?

Mr. PACKARD. Thank you, Mr. Chairman. I certainly appreciate your leadership and that of the ranking minority leader, or the ranking Republican on the committee, for their leadership in calling for this hearing.

I have been very concerned and interested in the infrastructure for as long as I have served on this committee, which is eight years now, and we have not made a great deal more progress now after eight years, and that is concerning to me.

Certainly, I want to welcome Mr. Runyon and the other witnesses that will testify for us today. I think it is obvious that America's infrastructure is crumbling, and if we don't do something, the problems are going to become almost insurmountable in terms of funding, and therein I think lies the fundamental question, how are we going to fund the rebuilding of America's crumbling infrastructure?

I think we really have but two options. One, of course, is to use the existing funds that are available, that being the trust funds. And those certainly should be used to build, rebuild those portions of the infrastructure for which those trust funds have been collected.

And secondly, of course, I think we need a greater commitment from this committee and a greater commitment from the Congress to fund America's infrastructure.

I served on the Economic Development Committee, and I don't believe there is going to be economic development if we don't find a way to build the structures that support and sustain economic prosperity.

Therein, I think, is the value of this hearing, and I appreciate very much your calling it. Thank you, Mr. Chairman.

[The statement of Mr. Packard follows:]

STATEMENT OF HON. RONALD C. PACKARD REPRESENTING THE 43D DISTRICT OF CALIFORNIA

Mr. Chairman, I would like to welcome Marvin Runyon, formerly of Nissan and currently head of the Tennessee Valley Authority [TVA] and each of the other witnesses scheduled to appear before the committee today.

The testimony of today's witnesses, I am certain, will show among other things, No. 1, the great and pervasive need for an increase of funding for our Nation's infrastructure and No. 2, the strong relationship between the infrastructure and economic productivity.

This committee has had hearing after hearing, witness after witness, on the topic of infrastructure. One common view is forwarded, our Nation's foundation, its national public works infrastructure is crumbling. Everyone also agrees that more funding, more money is needed to be spent on our infrastructure.

Members of this committee have been aware for some time that we as a nation have underinvested in infrastructure. We have talked to our colleagues in the House especially our friends on the budget and appropriations committee. We have tried to impress the great need on the current and previous administrations. Our pleas, however, have fallen on deaf ears.

But, infrastructure is important, and this particular hearing is important for we hope to make people aware of the direct relationship between infrastructure and economic productivity and of the relationship between infrastructure and our international competitiveness. International competitiveness is a topic of concern of all Americans. The American public is worried about the United States losing its competitiveness edge in the world economy. The extraordinary expansion of the Japanese economic strength, the success of the Pacific rim, recent changes in Eastern Europe, the distinct possibility of a new huge economic power with the reunification Germany, not to mention the formation of the European Community in 1992, have many of us concerned about the shrinking role of the United States in the global marketplace.

What I hope this hearing will do is to raise the level of awareness of our colleagues and the American public that increases in funding for our infrastructure are necessary for economic productivity and international competitiveness. We must make this point clear to the American people. We must show this direct relationship between funding of infrastructure and ultimately the quality of life of our citizens. Money spent on infrastructure is an investment, a good investment in our future.

There can be and should be considerable debate on where increased funding for infrastructure will come from. First, we must commit and obligate and spend available monies in the infrastructure trust funds on infrastructure. No more budget games. Beyond that, we should examine the role that private enterprise and private sector money can play in rebuilding our infrastructure. We should also look at the appropriate role that the various levels of government should play. What degree of responsibility should be accorded to each Federal, State and local level of Government to ensure that the investments in infrastructure are wisely made. I would be very interested in the panelists opinions on this subject. While there may be debate on how best to invest in our infrastructure, there should be no debate that investment is desperately needed.

I commend the chairman and ranking member for calling this hearing and for their continued leadership in fighting for our Nation's foundations.

The CHAIRMAN. Are there other opening statements? If not, we will proceed with the witnesses.

Our first witness today, and one who I believe is uniquely qualified to lead off the hearing, is the Honorable Marvin Runyon, Chairman of the Tennessee Valley Authority Board of Directors. For the past three years, Mr. Runyon has sought to improve TVA's productivity and efficiency in meeting its overall infrastructure goals.

Prior to joining TVA, he served as President and Chief Executive Officer of the Nissan Motor Manufacturing Corporation, USA and before that, he was with the Ford Motor Company for 37 years. Both experiences, I believe, provided him with the unique perspective to address the subject of today's hearing.

Chairman Runyon, I welcome you to the committee and look forward to your presentation.

TESTIMONY OF HON. MARVIN RUNYON, CHAIRMAN, TENNESSEE VALLEY AUTHORITY BOARD OF DIRECTORS

Mr. RUNYON. Thank you, Mr. Chairman. On behalf of our Board and the employees of the Tennessee Valley Authority, I am honored to appear before you today. I believe that the members of this committee have shown great foresight in focusing this hearing on a subject that is so essential yet so often taken for granted.

"Infrastructure" doesn't have the glamor associated with high tech, and it doesn't have the luxury of a high profile, but it is highly important to this Nation's future. That is because we are really talking about investments in the basic facilities and services needed to keep this country going; investments in America's foundation for competitiveness in a changing world.

We appreciate this opportunity to tell the members of this committee what we are doing to contribute to this framework for the future as we make TVA an even more productive asset for the Tennessee Valley region and our Nation.

I know that some members of this committee are already very familiar with TVA, especially Congressman Clement, Congressman Duncan, and Congressman Ballenger. Their Districts are a part of TVA's 80,000-square-mile service area, and we are grateful for their counsel as members of the Valley Delegation, as well as their contributions as members of this distinguished committee.

We also appreciate the encouragement that members of the committee have shown for TVA's new way of doing business and the results we are achieving. Through a combination of teamwork, increased communication, and participation by all our employees, we have become a more business-like organization. And we are accomplishing goals, such as our three-year freeze on electric rates that just a couple of years ago many people thought were impossible.

Today, we are here to focus on TVA's role in strengthening our national framework for delivering essential services.

As I mentioned, every reference that we make to infrastructure is really a reference to investments in the common good. We are talking about investments that enable economic growth to take place and stimulate other improvements in the quality of life.

When TVA was established by an Act of Congress in 1933, this unique public corporation was given the charge to work with the people of the region to bring about a wide range of improvements in the quality of life in the Tennessee Valley.

To accomplish this mission, TVA built a foundation for regional development. That framework included multi-purpose dams that controlled flood and improved navigation along the Tennessee River and its tributaries. Those dams also brought electric power to the entire region, including vast rural areas in which only three farms in 100 had electricity. TVA demonstrated that selling power in new markets could actually lower the unit costs of electricity to consumers.

To meet the region's growing power demands, TVA was one of the first electric power suppliers to experiment with large turbine generators in steam plants. Our high-voltage transmission system was another "first" in the industry. These and other advanced engineering technologies pioneered by TVA now benefit every power consumer in the United States.

TVA became a national laboratory for developing new ideas and new ways to improve the quality of life through partnerships with State and local governments, the private sector, and educational institutions across the region. TVA's power system today serves more than 7 million homes, businesses, and industries in parts of seven States; and that system is connected by a 17,000-mile network of transmission lines.

The original investment in TVA's power system came from Congressional appropriations. But since 1959, on the recommendation of this committee, our power system has been self-financing. And in our annual payments to the Treasury, TVA is paying back, with interest, the original public investment in our power system.

Today, TVA operates 39 dams on the Tennessee River and its tributaries, the Nation's fifth largest river system. This series of dams and locks makes commercial navigation possible for the 650-mile length of the river from Knoxville, Tennessee to Paducah, Kentucky. It is a vital link in the inland waterway system that provides access to ports in 21 States from the Great Lakes to the Gulf of Mexico.

In addition to being the most energy-efficient form of moving goods, waterway transportation also helps hold down maintenance costs for other parts of the Nation's infrastructure. After all, a single barge has a carrying capacity that is equal to 15 railroad cars or more than 60 tractor-trailer trucks.

Since TVA first provided a commercially usable channel for river traffic, transportation savings to shippers are estimated to have totaled more than $2.5 billion. And private investment in waterfront plants, terminals, and distribution facilities has added up to more than $5.8 billion.

For our river system to continue to contribute to economic development, locks at the dams must be able to handle greater demands. However, river traffic is being hampered by small locks on three upstream dams. Those locks were built in the 1930s and 1940s, when towing equipment and loads were much smaller.

We realize the need to make our river system more competitive by modernizing and tapping the full potential of this important resource. Overall, the framework that TVA built for electric power, navigation, and agricultural productivity has helped our region and the Nation grow and prosper.

The Tennessee Valley also is now one of our Nation's major manufacturing areas. More than 30 percent of the region's gross product comes from manufacturing, compared to 22 percent nationwide. Competitively-priced TVA power is just as essential to those industries as the jobs that they provide are crucial to the communities of our region.

And we know that many manufacturers and farmers depend on our river system to ship their products at a competitive cost. That is why we are making sure that these investments continue to generate benefits for the Valley region and the Nation.

And as I have mentioned, the returns aren't limited to those from bricks-and-mortar projects. About 75 percent of the modern products and processes used to increase soil fertility are based on technology developed by TVA researchers. And today, TVA's National Fertilizer and Environmental Research Center is meeting an even wider range of responsibilities.

I mention these contributions, Mr. Chairman, because they are directly attributable to the wise investment of federal dollars to build a framework for economic development.

In determining how we can continue to maximize the return on this investment, we don't have to look beyond the horizon. The challenges presented by an increasingly competitive global economy are in full view. Our course is clear. We have to make and keep TVA competitive as a utility and as a government agency.

We must make sure that our self-financing power system supplies electricity at the most competitive rates possible. And we must manage our resource development programs effectively so that they continue to merit the support of this committee and your Congressional colleagues. Maximizing the return on these investments is essential, so our region and this Nation can stay competitive.

With the support of Congress and our customers, we have held TVA's power rates stable for the past two years. We fully expect to keep rates steady for 1991, and we are optimistic about extending rate stability beyond our original three-year goal.

To make TVA's rate stability possible, we have achieved cumulative savings of more than $900 million. We have reduced staffing by 11,000 employees, about a third of TVA's work force, with no adverse impact on service to our customers. We have also reduced overhead costs by about 30 percent in our resource development programs, making more funds available to improve services to the people of our region.

These cost savings and productivity improvements have reduced TVA's operating expenses to the lowest level since 1986. And while we reduced operating costs, we increased power sales last year by 2 percent. That may not sound like a lot, but in the context of a power system the size of TVA's, it amounts to almost 2 billion kilowatt-hours. That is enough power to serve 135,000 homes.

By holding down the cost of power and making our services more effective, TVA is helping to make the region we serve and our Nation more competitive.

TVA's central challenge for the 1990s and beyond is to be the most competitive electric utility in North America in terms of cost, quality and delivery, and to be the most efficient and productive agency in Federal service.

We realize that we have much more to do to keep TVA competitive. But we also hope that the lessons we have learned about increasing productivity will prove useful to others in the public and private sectors.

In our push for more efficiency and productivity, no savings have been dismissed as too small, even in the context of a $5 billion budget. Senator Everett Dirksen once said in reference to the Federal budget that "a million here and a million there, and pretty soon, you are talking about real money."

You could say that we applied Senator Dirksen's approach in a new context: Save a million here and a million there, and pretty soon, you are achieving some real savings. In many cases, it wasn't a million or even close to that amount. For instance, our resource development group identified a savings of $6,000 by reducing computer time and other costs associated with producing their monthly ledger sheets.

On the other end of the spectrum, we renegotiated our coal contracts to take advantage of market conditions and saved nearly $30 million in annual fuel costs. And our initiatives to refinance TVA's high-interest debt are saving TVA power customers nearly $150 million a year.

We also took action to realize the savings that come from good management. We have recruited a number of top-level managers from the private sector and gained an infusion of new ideas to help renew TVA's spirit of innovation.

In TVA's Nuclear Power Program, for example, we have reduced contract manager costs from more than $17 million in 1986 to zero this year. In other words, we have no contractors serving as line managers at TVA today. We have replaced them with a strong management team of TVA personnel.

Our power customers have enjoyed the benefits of this new era of professionalism through record-setting performance. Last year, both units of our Sequoyah nuclear plant near Chattanooga set continuous run records. And Unit 1 at Sequoyah ranked second in the United States and eighth in the world in terms of generation.

As an organization, TVA is stronger and strategically better prepared to become a more competitive asset for the Valley and our Nation. We have set an agenda for the 1990s, concentrating on five strategic areas. We are focusing on providing environmental leadership, stimulating economy growth, serving our customers through a customer-first philosophy, maintaining a quality work force and workplace, and achieving excellence in nuclear power operations.

With your permission, Mr. Chairman, I will submit for the record a copy of more detailed information that I provided to all TVA employees and retirees about each of these strategic areas.

The CHAIRMAN. Without objection, so ordered.

[The information follows:]

Topside

Mapping out TVA's agenda for the 1990s . . .

By MARVIN RUNYON, Chairman, TVA Board of Directors

My Board colleagues and I recently had a good discussion with more than 200 of TVA's key managers about five strategic areas that will shape TVA's future in the 1990s.

Those five areas are (1) environmental leadership, (2) economic growth, (3) excellence in customer service, (4) a quality workforce and workplace, and (5) excellence in nuclear power operations.

Many TVA projects support these strategic areas. Building on these initiatives will enable us to make TVA even more effective in serving the citizens of the Tennessee Valley and the nation.

Let me give you an overview of what we expect to achieve.

• • •

First, providing environmental leadership means going beyond basic compliance with laws and regulations. Leadership means solving problems in innovative ways and demonstrating to others how environmental challenges can be met.

TVA has always been a national laboratory for addressing a wide range of environmental concerns. That's evident today in our employees' contributions to solving a variety of air, water, land, and waste-management problems.

For instance, the progress of the Atmospheric Fluidized Bed Combustion project at Shawnee Fossil Plant is a major step toward cleaner air for our nation. As one of America's largest consumers of coal, we must continue developing and testing new pollution-control and clean-coal technologies.

TVA has cut its emissions of sulfur dioxide in half and reduced particulate emissions by 93 percent. We're not only committed to having our plants comply with clean-air laws, we want them to continue to average well below the emission levels allowed. Our challenge is to demonstrate how to meet more stringent standards in the future, while keeping our rates competitive. Once again, we have an opportunity to become the yardstick for the utility industry.

We'll also be evaluating the use of refuse-derived fuel to help solve the growing dilemma of solid-waste disposal, and we've begun initiatives for internal waste-reduction and recycling programs to demonstrate the benefits for large businesses. In addition, our use of constructed wetlands for waste-water treatment has gained national attention.

We have even more opportunities to demonstrate environmental leadership at the National Fertilizer & Environmental Research Center.

The new name of this important facility reflects its emphasis on solving a wide range of environmental concerns, in addition to continuing to help improve soil fertility and food production. The change also underscores a broader concern for environmental matters in every area of TVA's responsibility.

• • •

Stimulating economic growth is our second area of special emphasis in the 1990s. We're gearing our business operations and planning to encourage quality economic growth and create jobs. Maintaining attractive power rates is the best incentive we can provide for new growth.

Since we announced our rate-stability goal in 1988, more than 900 firms have made plans to locate or expand in the Tennessee Valley. That adds up to more than $7.5 billion in new investments and more than 55,000 new jobs.

We've also introduced rate incentives that are tied to creating new jobs. Currently 128 of our 160 distributors are participating in our Growth Credit program that helps stabilize rates for all our customers.

It appears that we will meet the third year of our rate-freeze goal this October. Our key managers have challenged themselves to extend the freeze to a fourth year, and that would be a tremendous benefit for the Valley economy.

While many variables can impact rates, we should never regard rate increases as inevitable. We owe it to our customers to look constantly for new ways to keep rates stable.

We're close to the right size for efficient operations, so the rate-stability challenge has to be met through innovative solutions that maintain safety in the workplace and reliability in our power system.

• • •

Serving our customers through a consumer-first philosophy is the third area we're stressing for the 1990s. That means we don't take our customers, communities, or other constituencies for granted.

The success of this philosoph depends on every employee. For example, last year we improved our reliability rate on transmission service to 99.99 percent, and the average service outage lasted only about 13 minutes. These rates were achieved despite tornadoes in Alabama last November that inflicted the second-greatest amount of damage ever on our transmission system. Many disaster-recovery crews worked 36-hour shifts in snow and freezing rain. While restoring power to our customers, they also provided a working definition of customer service for all of us.

Areas of focus for the '90s—

- *Environmental leadership*
- *Economic growth.*
- *Excellence in customer service.*
- *A quality workforce and workplace.*
- *Excellence in nuclear power operations.*

We're taking action every day to strengthen our partnerships with our local power distributors and our direct-served industrial customers.

We were very pleased to learn this month that Larry Papasan, President of Memphis Light, Gas & Water, has recommended that our largest local power distributor extend its contract with TVA.

After conducting an extensive study of power supply options, the staff concluded that continuing MLGW's relationship with TVA would be in the best interest of the citizens of Memphis.

If the MLGW Board and the City agree with the recommendation, it will be good news for Memphis —which currently accounts for about 10 percent of our total power load—and for all TVA customers.

We look forward to Memphis remaining a valued TVA customer, just as we look forward to continuing to work with power distributors and communities across the Tennessee Valley.

We're also building stronger ties with leading industries that buy power directly from TVA. This spring, the Board and some of TVA's top managers had a productive meeting with executives of about 50 of these large employers.

We're working to meet their special needs for high-quality power, as well as to provide the flexibility, reliability, and value essential for them to remain competitive and help keep this region competitive.

• • •

Maintaining a quality workforce and workplace at TVA is the fourth area we're emphasizing for the 1990s. That means stabilizing our workforce, expanding employee involvement, and continuing to improve productivity.

TVA should be recognized as an excellent place to work, where employees are committed to their jobs, their work is challenging, and the work environment is inviting.

TVA Chairman Marvin Runyon

We've established new compensation policies to help us attract and retain highly qualified staff, and we're developing long-range strategies to meet the full development potential of a diverse workforce and keep competitive as the labor force changes.

We're also considering a flexible-benefits package, dependent-care programs, and fitness centers. These aren't frills—they're necessities to create a quality and productive work environment.

• • •

Excellence in nuclear power operations is our fifth area of focus in the '90s. That means operating TVA's plants in a safe, efficient, and quality manner.

Earning the public's confidence in our nuclear program is essential to our overall success.

Our hydro and fossil plants continue to be among the top power plants in the nation. Our goal is for TVA's nuclear plants to be among the top performers in the industry. Both reactors at our Sequoyah Nuclear Plant set performance records last year, ranking among the top 25 units in the nation and the world. We expect all TVA's nuclear units to be as efficient and reliable as the best in the industry and, above all, we expect them to be safe.

The Nuclear Regulatory Commission affirmed the comprehensive level of improvement in our nuclear program earlier this month, when it announced TVA no longer required the extra oversight of the NRC's Office of Special Projects. Our program is once again under the routine regulation of the NRC's regional office in Atlanta.

Achieving excellence in nuclear operations will position TVA in the forefront for considering the next generation of nuclear reactors as an option for expanding capacity when the time comes. That decision could be facing us before the middle of the decade.

Just as TVA has led the way in clean-coal technology, we should be prepared to take a leading role in new nuclear technology.

Safe and reliable production of nuclear power also helps us meet our environmental goals. If TVA had built coal-fired plants instead of nuclear plants for additional capacity, our emissions of sulfur dioxide would be about one million tons higher each year—or almost double the current amount.

Nuclear power's environmental benefits provide one illustration of the many relationships among our five priorities for the 1990s.

Focusing on these interrelated areas can help TVA meet our goal of becoming the most competitive electric utility in North America and the most efficient and productive agency in federal service. ▲

Mr. RUNYON. These initiatives are in keeping with the intention of TVA's founders to combine the authority of the Federal Government and the flexibility and initiative of a private enterprise.

I believe that the same kind of disciplined and business-like approach can be applied across the spectrum to strengthen America's foundation for competitiveness. Whether we are talking about operating airports or building and maintaining bridges, highways or waterways, taking a competitive and business-like approach can make these public investments more valuable assets.

Before I close, Mr. Chairman, I want to urge the consideration of two additional elements as part of the infrastructure for America's future. They may not be familiar in that context, but they also require substantial public commitments, and they also will serve as building blocks for a better future. These additions to America's infrastructure of the future represent investments in improving the quality of education and the environment.

Our education system must do a better job of teaching the basics of reading and writing and mathematics. But our young people need more than just the basics. Education must be a competitive advantage for them and for this country in the years ahead. TVA is working with the region's colleges and schools to establish a number of skills training programs.

And we are exploring ways that new technology, such as the fiber optic network we are installing for our power system, could have additional applications in support of education.

The need for a quality environment is receiving increasing attention today, and it also will require major investments.

TVA's commitment to environmental leadership already is paying dividends for the region and the Nation. We have demonstration projects under way to help solve a wide range of air, water, land and waste management problems. All of our Nation's resources must be managed wisely if we are to sustain growth and attain the quality of life that we all want to enjoy. So, both quality education and a quality environment have to be considered as essential parts of America's foundation for competitiveness.

In closing, Mr. Chairman, I hope that it is evident from the changes we are making that we want to make sure TVA remains a good investment for the American people. We appreciate your continuing support as we take TVA into a new era of quality and productivity.

The CHAIRMAN. Mr. Runyon, if I could ask you to think back to your days at Nissan and Ford Motor, how important was infrastructure to your ability to produce and to compete effectively?

Mr. RUNYON. Well, infrastructure was very important, Mr. Chairman, in siting locations, for example. It is very necessary that in the construction of automobiles, that you have to have a good infrastructure to get parts there.

So, therefore, when you go to look for a place to put a facility to build new cars, you have to have highways, rivers, air traffic, whatever is necessary to get there.

I can remember when we were siting the Nissan plant in Smyrna, Tennessee, we had thought, the Japanese had thought the best way to get there was to come by water around to the East

Coast, and so therefore, a site in Atlanta seemed like a very good site.

I had some of our experts in this country check it out. They found the best way to do that was to locate the plant closer to the West Coast, because it was cheaper to dock the parts on the West Coast and come by rail. Now, the Japanese don't use rail, so they are not familiar with that situation. That saved us approximately $20 million a year in operating costs.

But one thing we did find out, though, is we really need to work on our infrastructure a lot, because those trains coming across there, you really have to make sure your parts are packaged awfully well to take care of going over those roads. Those roads need to be improved.

So, those are the kinds of things you find out—that you have to have an infrastructure for. You have to be able to get people to work. They have got to get there.

I have heard some comments about how long it takes to get from one place to another. I learned that last night, when I got here about 10:00 and tried to get to the Hyatt Hotel, which was across the street from where we were having a birthday party. I had to carry my bags four blocks. Even getting out of the airport at Dulles was a difficult job for me.

So, all of those things are very important when you are trying to operate a business. Then, to get the product shipped out to the location it has to go to.

The CHAIRMAN. Well, again, drawing upon your experiences, what factors do you suggest that we consider in crafting a national infrastructure program that would aid in promoting economic growth, productivity and competitiveness in the United States?

Mr. RUNYON. Mr. Chairman, I think that one of the most important things that we can improve is transportation. I continue to see cities that have highways into them that are being reworked, that are corroded. It is my personal opinion that rail transportation should be upgraded so that we can move more people in that fashion, as opposed to on the highways, which do cause problems for the air pollution and create other problems for us that we need to work on.

So I think those areas really need to have some improvement. I mentioned introducing education as part of infrastructure, and we really do have to improve the education process if we are going to be competitive worldwide in economy.

The CHAIRMAN. Mr. Hammerschmidt?

Mr. HAMMERSCHMIDT. Thank you very much, Mr. Runyon, for your fine testimony.

Let me follow up a little bit, if I can, on some of the ideas you set forth that the chairman was discussing. You know a great deal will be said later in the day about the return on capital that accrues from private and public infrastructure investment.

And traditionally, I think, in this country, we have considered certain types of investment to be just public works, they have been done by the Federal Government, and they have played a lead role in their development through the years. And then we have considered others to be the responsibility of the private sector.

But given the productivity gains that are predicted to be gained by greater infrastructure investment, are we reaching the point where the lines separating government from private, or should be less distinct, or should be better integrated? And I think your experience of locating that Smyrna plant—would you comment a little bit further along that line?

Mr. **Runyon.** I think regardless of how integrated they become, I think we have to analyze the money that we spend to make sure we are spending the money in a wise fashion, in a business-like fashion, not just spending money because it is a good thing to do, but spending money that is going to get a return. That is going to make us more competitive.

I think we have to look at the alternatives to determine which is the best way to spend money to make us more competitive. There has to be a return. If there is no return coming, we are not going to solve our problem of being competitive in a worldwide economy.

Anyone that thinks we are not in a worldwide economy right now is wrong. We have to compete worldwide. We have to compete, for example, on the cost of power worldwide. People say, well, that is crazy, you can't ship power in a boat.

Well, you can ship power into a boat. First you build it into a car. You make an ingot of aluminum with power, and then you ship it. Those things are getting to the point, unless we are competitive in all the areas of our infrastructure, we are not going to make it.

I would say whether private or public does it, both have to make the same considerations of whether it is going to help us be more competitive in the world economy.

Mr. **Hammerschmidt.** Well, it is going to be interesting. I know some things private capital—the marketplace just really won't support long range, but yet in the long haul, you get good productivity, you get a good return on the investment.

I think what I hear you saying, let business judgment and return on investment and the marketplace dictate things, even though the government is involved, the lead people making those decisions probably ought to be the business people.

Mr. **Runyon.** Example of government versus private, it is very difficult to assign private capital to improving a lock on the Tennessee River. There is no company going to go out and build a new lock on the Tennessee River, because they do not use it that much. That clearly, I think, has to be government to take care of something like that.

In an area of railroads, though, you would think that private capital could figure out how to do that and make it economical. They may need some help in research, and I think government plays a strong role in research.

For example, at TVA, we play a strong role in research in fertilizer development, and we have for this country and the world. TVA has developed 75 percent of the fertilizers that are used in this world today, and that wouldn't have been done had government not done that.

So, I think there is a place for government to do certain of these things, and a place where private industry probably should step in and do more.

Mr. **Hammerschmidt**. Speaking of locks, you recall a major lock, up by St. Louis, which passes a great deal of the grain we send all over the world. We approached that by saying, if you will put a user tax on barges, you can build Lock and Dam 26. It is sort of trade-off in that area, and I suppose that works to the public interest and benefit.

Mr. **Runyon**. We do that also with highways in some locations. There are user taxes on highways that you drop a quarter in now and then, or you can't go any further.

Mr. **Hammerschmidt**. One more comment before I yield to my colleagues. We certainly are in a global market in everything we do now, and your testimony cites quality of environment as a key part of this infrastructure for America's future.

How can we reconcile the view this Nation's attention to environmental quality may vary, over the years, worked to the competitive disadvantage of American business, compared to foreign manufacturers whose governments have no corresponding commitment to the environment? That may not be a good premise, but is it at the moment?

Mr. **Runyon**. I remember many years ago going into Germany. I visited 12 automobile plants over there in a couple of weeks, and when I went back into the rural area, smokestacks were just polluting something badly. I understand that has been cleaned up some.

I don't know what other governments are doing. I think we should strive in some fashion to get everyone to come to the same standards. An example is the nuclear industry.

You know, back 15 years ago, I guess now, the nuclear industry in the United States organized what is called the Institute of Nuclear Power Operations, INPO, and they control the way training is done for U.S. nuclear plants. They pass certification on training programs set up by utilities, and just recently, the nuclear operators formed the world organizations WANO, which is World Association of Nuclear Operations.

We met in Moscow, as a matter of fact, and all signed an agreement that we would share all experiences we had and knowledge we had about nuclear power. Now, nuclear operators did that even though some of the countries from which those nuclear operators came from don't have diplomatic relations, but still, they have a very common reason for wanting to get together and share information and come to a common knowledge of what is there and what needs to be done.

And I think we need to do that on an environmental basis, also.

Mr. **Hammerschmidt**. I would suppose over time, because investments are now global and markets are global, that that will lead you to common environmental concerns worldwide, that eventually you might have protocol as to where you are all operating under similar restrictions.

Mr. **Runyon**. I would sure hope that would lead to that. And if there was some way we could direct it that way, I would sure hope we would try to do that.

Mr. **Hammerschmidt**. Thank you very much.

The CHAIRMAN. We have some other questions to ask of you, but we also have to go vote, and so, we are going to stand in recess now until, let's say, 10 after and we will finish our questions then.

We will stand in recess.

[Recess.]

The CHAIRMAN. The meeting will come to order.

Mr. Mineta, do you have any questions?

Mr. MINETA. Thank you very much, Mr. Chairman. I want to thank you very much for your leadership in holding these hearings.

I want to commend Mr. Runyon for a very, very fine statement this morning before the subcommittee, and commend Mr. Runyon—not only for his enlightened leadership in terms of the business community, but now in his new role as—or not new role—but his role as Chair of the TVA.

Our colleague, Congressman Clement, of course, Mr. Duncan and others, Mr. Ballenger, have been great supporters of TVA.

I was interested in your statement about the locks at the dams might be able to handle greater demand. Is the work on locks, does that come from monies generated from your own revenue or do they come from appropriated revenues from the Congress to that TVA for the improvement of those locks and dams?

Mr. RUNYON. They come from appropriated funds specifically for that purpose. They are designated for that purpose.

Mr. MINETA. Is there any work that is being done in terms of some of these things that you point out as to—on the locks, in order to improve the efficiency of those?

Mr. RUNYON. Yes, sir. What is happening now is that we are—we started a study through a Congressional request last year, through this year's budget. In next year's budget, additional monies are being requested to continue that study, to finish it together with the Corps of Engineers.

We work very closely with the Corps of Engineers on locks.

Mr. MINETA. Now, the fact that because of what you do, obviously this is stirring and spurring a lot of economic development. You say that your gross product in the region, 30 percent of your gross product comes from manufacturing compared to 22 percent nationwide.

Obviously a lot of industry is going there because of the electrical rate power. The thing—I would like to commend, and I think this is really leadership on your part to be able to say you think there are two other essential elements of infrastructure that have to be considered in that.

That is, education and the environment. I really want to commend you on that. I suppose as you are bringing the industry in, you have to make sure you have an educated work force to deal with the companies that are coming in for, because of this manufacturing.

Mr. RUNYON. We are finding that is very important. In the past two years, since we have announced we were not going to raise our rates for three years, and now it looks like we may go four or more, we have had over 700 companies that have either moved into the Valley or expanded their operation, invested over $7 billion of new capital and have added over 55,000 jobs.

Now, as that goes on, it becomes very obvious that the technical training that we have needs to be improved. We at TVA are working very closely with our technical schools, you know, the second level of schools after high schools, and the technical schools, to improve the education and knowledge of our people to work with the kind of high-tech industries coming in.

When I say the kind of high-tech industries, most industry is high-tech these days. It is high-tech to run a home these days, as a matter of fact, because of the kind of things we are bringing into homes. We need to improve that educational process.

We are working with our junior colleges in the TVA area to help them in their curriculum and training techniques.

Mr. **Mineta**. Would the TVA consider the construction of—in terms of infrastructure, is the public sector responding quickly enough in terms of your roads portion of the infrastructure, roads and highways?

Mr. **Runyon**. As you go around the Valley, you see new roads and highways being built. I think we need to move faster. I think we need to get ahead of the game. We need to project further forward.

What I am seeing happen is that as the need is there, we start the roads. When I say need, I mean the car is there waiting to go down the road. We need to start sooner. We need to get the project going so that by the time the car gets there, the road is there. We are not at this point in the country.

Mr. **Mineta**. If push came to shove, do you think TVA would be in the position of considering private toll roads?

Mr. **Runyon**. Well, I don't know that TVA has a real part to play in——

Mr. **Mineta**. Congressman Clement, quit kicking me.

Mr. **Runyon**. Those toll roads, usually individual States, I think, are the ones that decide whether there are going to be toll roads or not. The fact is, that is a way that some people have done things.

Mr. **Mineta**. I just want to thank you again, Mr. Runyon, very, very much for your enlightened leadership, not only in your past, in your business experience, profession, but now as Chair of TVA. I want to thank you very much.

The **Chairman**. Mr. Hancock?

Mr. **Hancock**. Thank you, Mr. Chairman.

I am curious about the effect of the clear air bill, the acid rain bill, on the production of electricity and energy at TVA. You indicated that you have basically said that you are not going to raise rates. I am confident that every private energy producer would like to be able to say the same thing.

I don't think they are willing to say that. Are you going to have a problem with the clean air bill, the fact that they are cutting out the use of coal? You use a lot of coal in your production. What is the effect going to be?

Mr. **Runyon**. We said that we wouldn't raise the rates for three years. We have held to that for two years now. In October, we will hold to that for the third year. We think that we can probably go the fourth year and maybe even a fifth year of not raising rates.

However, the clean air bill will definitely be added cost to TVA in the production of electricity. Depending on final outcomes of all of these things that we are studying now, it could be from one and a half to $2.1 billion added capital expense. It could be $800 million operating expense. I am talking about at the end of 10 years. Those costs could be there.

Depending on toxics, it could be, you know, actions that might be taken on toxics, it could be another $1 billion in investment. Those are all costs that will have to be borne somewhere along the line as we get to that point.

What are we trying to do to offset those costs? We are trying to reduce our costs by 5 percent every year. Because, if we are going to be competitive, you don't just keep your costs and keep going up every time there is an economic increase. You can't do that and pass it on and stay in business.

We are trying to be competitive. We are trying to cut our operating costs every year. It is difficult to offset $2 billion in capital investment and $800 million in operating costs that we are going to be suffering five to 10 years down the road.

Mr. HAMMERSCHMIDT. Will the gentleman yield?

Along your line of questioning, I wanted to ask Mr. Runyon, to what degree do you get relief from having nuclear plants? That relieves you of the environmental problem of the Clean Air Act, does it not? What percentage of your electricity is generated by nuclear?

Mr. RUNYON. Right now, our percent of nuclear is 11 percent. Hydro is about 17 percent, and the remainder is coal. In the United States, the numbers are: Nuclear is 19 percent; hydro is 10 percent; and coal is 56 percent, and there is gas and oil that is some smaller percentages.

But nuclear does not have the problem with clear air, as you well know. It is clean and it is safe power. A lot of people are concerned about nuclear power. They say it is unsafe, and how about Three Mile Island and all those kinds of things?

Well, Three Mile Island didn't hurt anybody except to the tune of $1 billion in decommissioning costs. Those kinds of things, you know, cost money. But nuclear is very safe power, and it is very clean. You have no clean air problems with nuclear power. That is why we are proceeding on to complete our nuclear plants.

We have, as we said before, five that are licensed, two that are operating. We are going to bring the other three licensed units into operation, and we are going to bring in four more units that have not been licensed.

We are going to complete those and have them all on stream by the year 2000. It will be nine nuclear units. At that time, we will be one-third nuclear.

Mr. HAMMERSCHMIDT. I want to get your very professional and your good judgment into the record. I appreciate it.

I thank the gentleman for yielding.

Mr. HANCOCK. Another question I had, you indicate that you are paying the Treasury—that you are paying back with interest the Treasury. TVA was established, I think, 57 years ago; is that correct?

Mr. RUNYON. 1933.

Mr. HANCOCK. I am just kind of curious on the interest rate. Do you receive the same interest rate factors that the REAs—like 2 and 3 percent, when the government is paying 9 percent for it?

Mr. RUNYON. I am not aware of any 2 or 3 percent interest rates that we have. As a matter of fact, we recently refinanced $8 billion of our debt that we had with the Federal Financing Bank. The reason we refinanced it is that the interest rate that the TVA was paying on their $19 billion that we have outstanding in debt was 10.25 percent. We had notes in there as high as 14.5 percent.

I think there were some at 14.9 percent with the Federal Government through the FFB. By financing on the private market, we were able to reduce our total interest debt from 10.25 percent to 8.5 percent. We have been able to reduce it by doing that. We just did that last year.

Mr. HANCOCK. I don't have any other questions, Mr. Chairman. Thank you.

The CHAIRMAN. Mr. Clement?

Mr. CLEMENT. Thank you, Mr. Chairman.

Mr. Runyon, great to have you here today. I know Congressman Hancock, my colleague, commented a while ago about the clean air bill. I might say to you, TVA, in years past, spent some money when other utilities did not spend money for clean air.

That is why TVA probably—it will not have to do as much as other utilities across the country when it concerns clean air, because we were one of the leaders in the country in terms of cleaning up the utilities and trying to solve the problem with acid rain.

I know it has already been mentioned very briefly about nuclear power. I would like for us to expand that conversation, because I think we are going to hear a lot more about it, particularly in 1991, with all those oil spills and realizing that by the year 2000, we will probably be 60 percent dependent on foreign oil.

Much of it has to do not necessarily with the exploration of oil and gas, but the transportation of oil. Most of it has not been domestic carriers. It has been foreign carriers, just like the one we are struggling with with the Norwegian freighter at this time. I think we are going to look seriously again at the nuclear option.

Mr. Runyon, as you know, we almost lost the nuclear option. Not economical, people not thinking it was safe enough. It is almost as if there was a conspiracy to destroy the nuclear option.

I would like for you to expand. What does the nuclear option mean, not only to the Tennessee Valley area, but for the entire country?

Mr. RUNYON. I think that nuclear energy is safe, it is clean, and it is as economical as any kind of energy we can get. We have a problem today, however, in that the costs of putting a nuclear plant in place is very, very high.

I think we need to adopt some type of policy in this country whereby we would agree that we would build all the same type of unit, probably 600 megawatts in size, because that is an economical size. When you get much smaller than that, it is not as economical; that it should be a common design that any plant that is built would meet that design.

Having said that, that design has to be pre-approved by the NRC so that you know when you build that, that you will get a license as long as you build it to the specifications that have been pre-approved.

I think if we could do that, then we could get to the point that we could build a nuclear plant in this country in five years and make it more economical to do it. It is something I am very interested in, because at TVA, we have enough power to last us until the year 2000 by the completion of the nuclear plans that we have already started.

But at the year 2000, 2002, 2003, depending on demand, we are going to be having to have more power in place. I don't mean think about it. I am talking about having it in place. So, in the next two or three years, we will have to make a decision at TVA what that power is going to be, because it takes seven years to put a coal plant in place.

So, we have have to decide if it is going to be coal or nuclear. We can't make that nuclear decision until we get this type of thing that I am talking about. At TVA, we have got nine nuclear plants, and they all are different. We cannot move an operator from the Brown's Ferry nuclear plant to the Sequoyah nuclear plant without extensive training.

I am talking about extensive like months of training. We ought to be able to have nuclear plants in this country so that you can have an operator in Seattle that could move to Atlanta and do that job, because the plant is identical in size and scope and operation.

Mr. MINETA. Would my colleague yield on that?

Mr. Runyon, that is an interesting point, because I would like to follow up on that. Boeing built the 747. Boeing gets that airplane certified by the FAA. United Airlines doesn't have the 747, they buy certified by FAA. American Airlines doesn't have this 747, they buy certified by the FAA.

So, in this case, if you have got, let's say, light water reactors, whatever, is there a way of having—you only have General Electric, Westinghouse, Babcock, Wilcox——

Mr. RUNYON. Combustion Engineering.

Mr. MINETA. As the producers of nuclear plants. Why can't we get, let's say, those four, then, to get a license for their plants licensed by NRC so that each of them can take those licensed plants and put them inside A or B and modify them because of the topography and because—or because of the nature of the construction that is going on, rather than to have each time another United Airlines, Braniff—they don't get each airplane that they buy certified.

Why can't we use that same approach as it relates to nuclear powerplants?

Mr. RUNYON. I think that is an excellent approach. I would take it a step further. I would have one design. Any one of them could build it. The competition would be who would build it the cheapest. You see, we are talking four designs. When you take four designs, you can't move a GE operator into a Westinghouse plant.

Mr. MINETA. Competitive pressure is to keep technology advancing for the cost down?

Mr. RUNYON. You need the competitive pressure. You can take the competitive pressure by first having a competitive design. Take that design and then put it to bid and get the competitive pressure on the bid for the parts. You do that in the automobile industry, you know. We design a vehicle. Then you put it out for bids. The parts.

There are three criteria on anything anybody buys, whether it is electricity, nuclear plant, coat and tie: Quality, price and delivery. If you take the print and say this is the print we are going to have in nuclear plants, so we can move operators from place to place and we can certify one nuclear plant, then you can have bidding on components in that, and you can have four people bidding against each other.

As long as quality, price and delivery are compatible, then you are going to take the best price.

Mr. **Clement**. Chairman Mineta, I might say to you that I have got a bill pending right now that Chairman Runyon is very familiar with, on nuclear standardization. My bill that I have got pending before the U.S. House of Representatives would solve many of those problems, where we could build a nuclear plant in five years rather than 12 years or more.

We would have a savings of 55 percent of the total cost of the nuclear plant. We are talking about billions of dollars, as you know, for each nuclear plant. It would be a tremendous break for the ratepayer, for the consumer. It would be safer, it would be more economical.

What it would do for America, it would make the United States more energy—it would make them energy-independent. We would also want to preserve our diversity. I think that is extremely important.

What about—and I would like for you to comment about my bill that is pending now, and then also about energy independence and diversity.

Mr. **Runyon**. I think what we are talking about is when we can do things cheaper and provide infrastructure in this country that is more competitive with people from around the world, that is what the game is all about. That is what we have got to get into. I think your bill does do that.

Mr. **Clement**. A senior economist at the Federal Reserve Bank recently stated, a root cause of the decline in the competitive position of the United States in the international economy may be found in the slow rate which our country has chosen to add to its stock of highways, port facilities and airports, which aid in the production and distribution of goods and services.

Do you think this to be the case?

Mr. **Runyon**. Yes, I do.

Mr. **Clement**. Why?

Mr. **Runyon**. You know, when you say the slow rate of putting in roads and railroads and things of that nature, I think I have just testified that we don't start our roads early enough to meet the demand. We need to get ahead of the demand in that area. Railroads are another good example.

We need to take a good look at the total infrastructure that we have, railroads versus roads. I travel around the Tennessee Valley a lot. We used to have company airplanes. We sold them because we couldn't afford to upkeep the company airplanes at TVA any more. Now we drive cars.

We drive cars because air transportation, public air transportation in the Valley just isn't as adequate. That is number one.

Number two, road transportation is a real problem because people are now building roads that should have been built 10 years ago. I think we need to get ahead of that curve.

The other thing we don't have is railroads. We have no railroads. When you talk about competition and you go overseas and you go to Japan and you look at the railroads they have got that operate on the second and move hundreds of thousands of people, they are way ahead of us in that. We need to get some railroads here that will travel 200, 300 miles an hour and get you from place to place.

Cut down the need for cars to be on the highway. Cut down the pollution that they create, no matter how good and how clean they are. Cut down the demand on common—on the use of oil which is foreign oil, as you mentioned. So those are the kinds of things that I think we need to be working on.

Mr. CLEMENT. Thank you, Mr. Chairman.

The CHAIRMAN. Mr. Clinger?

Mr. CLINGER. Thank you, Mr. Chairman. I have no questions.

The CHAIRMAN. Mr. Oberstar?

Mr. OBERSTAR. Thank you, Mr. Chairman.

Thank you, Mr. Runyon, for being with us and sharing your thoughts about productivity and infrastructure, the viewpoint of one of the great infrastructure programs of the Federal Government.

You cited the river traffic, page 2 of your testimony, and contrasted upstream dams built in the thirties and forties and their size to the size of a more recently-built downstream dam. You didn't assign a cost to rebuild those structures to accommodate traffic and move it more efficiently and effectively. I think that is one of the matters we need to know about.

When you approach a challenge of this nature, what is your thought process? How do you go about determining whether or not to undertake restructuring of dams? What will it cost? What will be its benefits?

Mr. RUNYON. What we are doing at the present time, we started this fiscal year. We intend to extend it through the next fiscal year at the direction of Congress. To determine the cost justification, cost benefit of enlarging those locks at those three locations, at Chickamauga, Watts-Bar and Louloun. We intend to have that study completed in the next fiscal year.

When we complete that study, we will have the answers to all these questions so we can make a good presentation to Congress as to what the cost benefit of that would be.

Mr. OBERSTAR. What is the cost of delay now? Your testimony says that if a barge tow can move through the lower locks in an hour, and on the upper locks it takes an hour for each barge in that tow. There must be costs associated with delay that ultimately are passed on to consumers. Public productivity is suffering as a result.

Mr. RUNYON. I don't have those costs with me. I would be glad to supply it for the record.

[The information follows:]

On the Tennessee River, barges are most economically moved in groups (tows) of fifteen barges pushed by one towboat. The average cost of operating a tow is about $250 per hour or $6,000 per day. It takes about two and one-half hours at a cost of

$625 to move a fifteen barge tow through the 600-foot locks below Chattanooga. To move the same tow through the small locks on the upper part of the system would require about fifteen hours at a cost of $3,750. Thus, the additional cost of locking a typical tow through each of the small locks would amount to over $3,000. These additional costs are reflected in rates for loaded barge movements above Chattanooga that are typically two to three times those for the rest of the system.

Mr. OBERSTAR. I think that is central to the inquiry of this committee, trying to assess the productivity and relationship between infrastructure and productivity.

My view is that the public sector must be productive for the private sector to be productive. The public sector is productive when our roads work, our roads are in good repair, bridges are in good repair and when our waterways are doing the jobs for which they are intended.

When they deteriorate, the private sector experiences delays in delivering goods. The public pays those costs. We maintain in place a process by which we continually review, continually upgrade, continually reduce the cost of bringing goods to market and people to jobs so that our private sector can remain productive.

Thank you.

The CHAIRMAN. Thank you, Mr. Oberstar.

Mr. Packard?

Mr. PACKARD. Thank you, Mr. Chairman.

We have not discussed the balance between Federal, state and local sharing of rebuilding America's infrastructure. I would be interested in your views on that, and also, what role the private sector might play as we look for funds and try to balance the funding mechanisms for such a huge undertaking.

Mr. RUNYON. I think that in the area of the private sector, I think there is place for them to provide funds through the taxes that we come up with, either through state or Federal. Usually that is state taxes, I believe. I think that there is an important part that they play.

From the standpoint of federal funding, I think things such as the waterways, which flow through States and are very difficult for a State to do anything on its own, are the things that become really sort of federal role. I think that the States have a very important part to play, though, in their area of jurisdiction, when it comes to roads, to determine what needs to be done.

From the standpoint of even going lower than that, cities and counties have some responsibility in determining how they are going to use their particular part of the funds and how they are going to provide the funds.

In the area of education, for example, I think that in education, you have many people who are responsible. You have cities, you have states, you have counties. Then you have principals. And you have Federal standards, so to speak, that I think we should have, and we should all be meeting those standards.

I think it is very hard to define who should be doing what. Anything that we do, we need to look at the cost justification of it. We need to look at what it takes to make us competitive internationally in that area.

Infrastructure, we have to be competitive internationally also. We tend to think that doesn't affect us, because it is something that is here. It is here, but how we use it makes us competitive worldwide.

I think that it is a very difficult question to answer exactly what percent should each one pay. We have to look at the end use to determine who actually is most responsible.

The CHAIRMAN. Mr. Duncan?

Mr. DUNCAN. Thank you, Mr. Chairman.

Chairman Runyon, I want to welcome you to the committee. I want to say that I have always been most favorably impressed with the job that you have performed as Chairman. Sometimes we say that one person can't make a real difference in this world, but you have certainly made a real difference with TVA.

I especially commend your efforts to make TVA more businesslike and more competitive. I know you have had to make some tough decisions and some decisions that probably you didn't really want to make. But the ratepayers of the Valley have benefited in your efforts, your valiant efforts to hold down the rate increases.

I will be very brief. TVA, of course, is very important to my District. It has a presence in many districts, but we have always been proud in Knoxville to be the home of TVA—or, we consider ourselves to be the home of TVA.

When we are talking about infrastructure, we are really talking about the age and shape or age and condition of certain types of facilities, such as roads and other public works. Some of the dams that TVA has have some age on them now. What are your concerns about the age and condition of the TVA infrastructure of the nuclear plants, the dams and any other facilities?

Are you concerned about that? Is the infrastructure a real problem with TVA at this point?

Mr. RUNYON. We continue to have a concern about infrastructure. I was at Norris' Dam yesterday. We have one unit that is down. For the first time, I was able to walk down into where the water comes in from the lake, to produce the power. I was surprised. For a dam to be as old as Norris Dam, which is the first one that was built, the shape that it was in.

The water wheels that are in those are a design that is 50 years old. We need to redesign them. By redesign, we can improve the efficiency of those dams by anywhere from 2 to 5 percent. That may not sound like much, but that is a lot. Two to 5 percent is a lot. We need to be looking at that, and we are.

In the past five years, our fossil plants have been worked very hard at TVA, because our nuclear plants were down and we need to depend totally on the fossil plants. We are looking at all the fossil plants right now to determine what it takes to upgrade them so that they will be in first-class shape.

You understand, and I know that you know this, but I will repeat it. All of the money in the power system is supplied by the ratepayers. So, the infrastructure of TVA in the power system will be paid for by the ratepayers.

It is sort of like the private people are paying for that and not appropriated money is paying for that. And so, we need to spend a lot of money to get those in first-class shape, and we are going to do that. We are setting up now—setting out now plant-by-plant to do that.

The nuclear plants, we now have Sequoyah in first-class shape. We received a very good rating from NRC just recently at Sequoyah. We are very proud of that. We are going to have the rest of our nuclear plants in first-class shape.

I think we are getting our infrastructure in good shape. Our distribution system is in good shape. We will continue to keep it upgraded.

The dams, we continue to look at them. We have a dam safety program. We are continuing to investigate our dams. As a matter of fact, this year, we are dropping the water at Fontana Dam. We are dropping it lower than it has ever been dropped to make our five-year inspection, to make sure we understand everything we need to know about that dam.

We will take whatever action is necessary as a result of our inspection.

I think we are going to have the infrastructure at TVA in excellent shape.

Mr. DUNCAN. I know there have been some substantial reductions, I think some 11,000 employees in the last few years. Are you able to get the key employees that you need to carry out this tremendous task of holding down rates and still improving the infrastructure at this point? Are you having some difficulty in competing with private power companies in that regard?

Mr. RUNYON. We have some difficulty. First, the major problem is that we can pay no employee at TVA more than a director makes. At the present time, I think a director makes $83,000.

It is difficult to find a senior vice president of nuclear power to come to work for you for $83,000 when they can make $250,000 working for any one of a number of, say, 60 power companies that have nuclear power. That is a problem for us.

We have put in place some things, such as bonuses and additional retirement benefits and so forth, to encourage people like Oliver Kingsley, who is doing an outstanding job for us, to come to work for TVA. Not everybody wants to come to work on the basis that a lot of their pay will be on a bonus which they may or may not get, which they don't have to do when they are in private industry.

One thing that would be very helpful to us is if we didn't have that ceiling on pay, if we could just pay competitive wages with the people we compete with. We are competing really in a private industry, which an electric utility is, with private people's money. That is our ratepayers. They pay money not through taxes, but through their rates.

We would like to be able to compete equally with them.

Mr. DUNCAN. One more thing, and I will stop, because I have a meeting to go to, and I am sure you do, too. But there is a feeling among many people that TVA is subsidized to a very large extent by taxpayers from all around the Nation.

What percentage of total TVA revenues come from the ratepayers, and what percentage comes from federal appropriations?

Mr. RUNYON. Our budget for power is about $5.4 billion. And in appropriations last year, we got $119 million. So, it is about 2 percent.

Mr. DUNCAN. All right. And that——

Mr. **Runyon**. From appropriations. By the way, none of the appropriations is used in the power funds. Appropriations is used in such things as the dam can control floods, as shown in the fertilizer research program, where 75 percent of the world's fertilizer will be developed there.

In areas like that is where the appropriated funds go, not an entire system.

Mr. **Duncan**. That was the next question I had. Thank you very much for the job you are doing, Mr. Runyon.

Thank you.

The **Chairman**. Thank you, Mr. Duncan.

Thank you, Mr. Runyon, for an excellent presentation. This committee looks forward to continuing to work with you and the TVA. Thank you very much.

[Mr. Runyon's statement appears on page 422.]

The **Chairman**. For the past two years, the Chamber of Commerce has been important in promoting infrastructure as a priority issue. I have encouraged this, because I believe there is a direct link between public works and our Nation's business community.

That is why I am pleased to have the Chamber of Commerce here today. In particular, Mr. John Bush, Vice President of Governmental Affairs of the United States Gypsum Company; and Mr. William D. Kelleher, Manager, Community Resources, the United States Chamber of Commerce.

I look forward to your presentations. Mr. Bush, you are first.

TESTIMONY OF JOHN BUSH, VICE PRESIDENT, GOVERNMENTAL AFFAIRS, U.S. GYPSUM CO., ON BEHALF OF THE U.S. CHAMBER OF COMMERCE, ACCOMPANIED BY WILLIAM D. KELLEHER, MANAGER, COMMUNITY RESOURCES, U.S. CHAMBER OF COMMERCE

Mr. **Bush**. Mr. Chairman, Mr. Hammerschmidt, and members of the committee, thank you for the privilege of being here. I am John Bush. Next to me is Bill Kelleher, the Chamber's Manager of Community Resources.

I would like to excerpt central points from our testimony, Mr. Chairman, and have the full testimony made part of the record.

The **Chairman**. Without objection, so ordered.

Mr. **Bush**. America's transportation infrastructure is crumbling, as we heard from others today, including yourself, Mr. Chairman. Decaying and overburdened roads, bridges, highways, airports, waterways are robbing the Nation of economic vitality.

Mobility, that is, the ability to move people and goods, has always been important to the United States because of its size and dispersion of economic activity. In a global economy, an efficient and cost-effective transportation network is vital to international competitiveness.

As world economic boundaries disappear and economic opportunities develop overnight, our Nation's ability to move people and goods quickly will play a major role in shaping our economic future.

In the fifties and sixties, America had a transportation network that was the envy of the rest of the world. This network played an important role in enhancing productivity and keeping costs low. In contrast, today, the United States faces a gridlock crisis in its transportation network.

Mr. Chairman and members of the committee, the Chamber specifically urges the committee to do the following things: One, put the trust back in transportation's trust funds by spending the funds' existing surpluses.

Two, ensure the continued financial integrity of the trust funds by taking them off-budget.

Next, oppose efforts to usurp transportation user fee revenues for other purposes. Support a Federal leadership role in establishing a national transportation system.

Enhance options for public-private partnerships and privatization and consider establishing an infrastructure bank and using capital budgeting concepts to better change infrastructure spending.

America's transportation infrastructure crisis is a result of six major trends, as we analyze the situation. First, suburban development. Next, economic relocation, demographic and labor force changes, increased automobile use, reliance on trucks and lack of infrastructure investment.

By almost any measure, the United States has reduced its investment in infrastructure. As a share of Gross National Product, spending on public capital dropped from 2.3 percent of GNP in 1960 to less than 1.1 percent in 1985.

As you said earlier, the U.S. ranks 55th in the world in capital investment in infrastructure. It spends a smaller share of its resources on highway investments than Japan spends, which relies much more heavily on rail transportation than do we in the United States.

As noted by David Aschauer, Senior Economist at the Federal Reserve Bank, the net result is decline of U.S. competitiveness. He said:

> A root cause of the decline in the competitive position in the United States may be found in the low rate in which our country has chosen to add to its stock of highways, port facilities, airports and other facilities which aid in the production and distribution of goods and services.
>
> For example, during the past two decades, Japan has invested about 5 percent of output in public works and achieved a productivity growth of slightly over 3 percent.
>
> While the U.S. has maintained a low public investment ratio of three-tenths of 1 percent and has seen inferior productivity growth at only six-tenths of 1 percent per year, America's transportation needs have changed.

Since 1950, 86 percent of the U.S. population growth has taken place in the suburban areas surrounding our cities. The impact of these trends can be seen in communities around the country.

For example, in a county 18 miles outside of Atlanta, the population has grown from 72,000 in 1970 to 250,000 in 1987. Very familiar to us here in the Washington area is Tyson's Corner, a nearby Virginia suburb. Tyson's Corner was virtually non-existent in 1950. Today, Tyson's Corner has more office space than either the City of Baltimore or downtown Miami.

Demand for new highways accompanying the population and employment migration to the suburbs and beyond has been met by an increase in new construction—has not been met by an increase in new construction. While the overall number of vehicle miles traveled between 1960 and 1987 increased roughly 168 percent in the United States, the number of new highway miles increased by only 9 percent.

Mr. Bush. As noted by the National Council on Public Works Improvement, "We have worn through the cushion of excess capacity built into the earlier investments without making commensurate investments of our own." The result has been a decline in our competitive position in the world economy and our quality of life.

Now, what has been the impact on business operations and productivity? There is a saying in business that nothing starts to happen until someone makes a sale. The corollary to that statement is that no job is finished until the product is delivered.

The declining quality of our highway infrastructure is impacting all aspects of business operations and is increasing costs and imposing delays that are hindering our ability to compete in a global economy.

As shown in table 1, all aspects of American business are using just-in-time inventory procedures to reduce inventory costs and limit the amount of capital tied up in unproductive areas. This requires a transportation system that can respond in a reliable and predictable manner.

To utilize plant and equipment and use labor more efficiently, firms are also using lower production run numbers. However, this process requires more frequent deliveries of raw materials and subcomponents as well as additional shipments to customers.

Transportation is a significant component of the costs of all goods. On average, 20 percent of the final cost of goods is the result of transportation expenses. An inefficient transportation system increases costs throughout the economy because it has an impact on manufactured goods at all stages of the production process.

How much should the United States invest in transportation infrastructure?

The U.S. Chamber of Commerce supports the concept of infrastructure investment as a means to promote economic growth, improve our competitive position in a global economy and stimulate improvements in American productivity.

Further, the chamber recommends that federal highway program spending levels be made consistent with American Association of State Highway and Transportation Officials report, "New Transportation Concepts for a New Century."

This would mean federal highway funding levels of $17.6 billion in fiscal year 1992, $19.6 billion in fiscal year 1993, $22.7 billion in fiscal year 1994, and $25.9 billion in fiscal year 1995.

Further, the chamber endorses reaching the high investment range in the 1988–2020 planning period, as shown in chart 2. In the short term, two to three years, we believe this level of investment can be supported by current user fee revenues and a reasonable drawdown on the existing highway trust fund surpluses and the interest income from the remaining surplus.

The chamber's recommendation is based on the vital role of transportation in the economy.

In summary, here is the chamber's position: the chamber supports continued federal action to provide a transportation system that meets the Nation's mobility needs.

There is an immediate need to begin to restore those portions of the basic infrastructure that have fallen into dangerous disrepair. In addition, every effort must be made to begin constructing those projects needed to provide the services required to accommodate growth. Programs to better use the existing infrastructure network should be encouraged.

User fees should play a central role in financing infrastructure construction, rehabilitation and maintenance.

The massive infrastructure needs of the Nation will require the establishment and enforcement of priorities for repairing, rebuilding and developing the public works needed to support commerce and protect the public health and safety.

Where appropriate, provision of public infrastructure services through private means or local authorities should be considered on a cost-effective basis. Privatization can and should play a key role in meeting public capital needs.

Establishment of a federal infrastructure bank should be considered by Congress as a method for improving the management of Federal contributions to State and local efforts.

Next year, Congress faces one of its most important challenges in 25 years. The basic legislation covering highway and transit programs will expire. The interstate highway system, which has provided a focal point for this legislation, will be declared complete. This will provide Congress, the Administration and the business community with an opportunity to establish new directions and develop new priorities.

Thank you again for this opportunity to express our views. Be assured of our vigorous support for your efforts to revitalize our highway system.

The **Chairman**. Mr. Hammerschmidt?

Mr. **Hammerschmidt**. Thank you very much, John, for a very comprehensive statement and getting the U.S. Chamber of Commerce on record for some important issues.

You know, this committee has been in the forefront of wanting to take the trust funds off-budget. We have been through that battle many times, and have almost been successful.

I am delighted to see the chamber on record of expending that money and giving us this projection what you think is reasonable out in the future. I, for one, agree with those projections.

Mr. Kelleher, are you making these known?

Mr. **Kelleher**. Yes, we are, Mr. Hammerschmidt. We are making an extensive effort to get this message out, not only to Congress, but our membership as well. About 15 months ago, we made a special effort on our annual meeting, and Mr. Clinger may remember participating in a video. We sent that out to about 350 chambers of commerce around the country.

We featured this issue on the cover of our magazine. I went out last week to talk to 100 Chambers in the mountain States about the need to increase spending on infrastructure, and put the federal program in a mode that would make the Federal Government a consistent partner. By taking the trust funds off-budget is one of the things we see as a key towards putting that reliability back into this area.

Mr. **Hammerschmidt**. I think that is great. I am delighted. It is more important you light that fire at the grass roots than up here on Capitol Hill, because ultimately, those views reflect itself up here.

I have a group of students here and teachers from Sala Christian School from Arkansas, and I am going to excuse myself. And we also have a vote on.

Thank you very much.

The **Chairman**. We do have a vote, so our time is running out. We have to recess to go vote and we will try to get back by 12:20.

We will stand in recess until 12:20.

[Recess.]

The **Chairman**. The meeting of the committee will come to order.

Mr. Bush, in the past, the chamber was not always a big supporter of infrastructure. Why the change, and how does it relate to a greater appreciation of the linkage between infrastructure and business goals?

Mr. **Bush**. I think Bill Kelleher would have a better handle on the history of this.

The **Chairman**. Mr. Kelleher?

Mr. **Kelleher**. That is very interesting. You asked that, Mr. Chairman, of one of our people that handles corporate relations, a gentleman by the name of John Mebon, is retiring, and he has been with us for about 30 years. Cleaning out his files, he sent us one of our newspapers in the 1950s.

The headline there is, "The Chamber is Supporting Infrastructure." And I think this is a return to some of our basic positions. I believe our current effort can be traced to the fact that transportation is a necessary part of a great deal of what is being done in the development of business strategies.

In our statement, we point to use of just in time inventory concepts and the fact that it is increasingly being relied on. The running of smaller batches, which requires more distribution efforts.

All of these things make transportation a key part of a business strategy.

The other issue I would raise with you is a point that as we get direct manufacturing costs down, and management experts like Peter Drucker say you have to get them down some place under 20 percent to be competitive internationally, freight charges, indirect support charges become increasingly important in terms of competitiveness in terms of final price.

Ultimately, our customers don't care how much went for transportation, direct labor, raw materials, they care about final price. If transportation costs continue to impose the forcasted excess cost of a $50 billion increase by the turn of the century, that is going to have an impact on our ability to compete internationally.

The **Chairman**. Mr. Bush, sometimes we use the words "productivity, growth and competitiveness," and when we do, we think of concepts and not realities.

Now, given your practical business experience, what do these words mean as applied to infrastructure and the daily operations of the business community?

Mr. **Bush**. We had an incident at one of our 24 manufacturing plants here in the United States, a little town called Stony Point in New York, below West Point on the Hudson River, where a bridge was rated from 60,000 pounds overnight down to 20,000 pounds because of its inadequate capacity or unsafe condition. It is going to be about two years before that bridge is fixed. We run about 60 large trucks out of that plant, delivering out product each day.

It was necessary to cut the antennas off the trucks and the exhaust pipes, so that we could squeeze them under a very narrow underpass under this railroad, because we couldn't get over it on the bridge any longer; and move the trucks along city streets, which is going to break those streets up.

Now, any time operations are delayed, and we are getting this in a generalized situation on most of the roads our trucks—our 1,000 or more trucks travel each day, it is less productive because it is a slower operation, it is a more costly operation, more repairs on the trucks.

I think—you know, Mr. Chairman, how things go sort of in cycles, and I think the business community is just sick and tired of the ruined tires, the delayed production schedules, because we are not able to get our raw materials in, or we are not able to service our customers as promptly as we wish, that productivity, so that is it.

And the other two were?

The **Chairman**. Growth and competitiveness.

Mr. **Bush**. If the costs go up, you are less competitive. Transportation is generally more than our labor costs, because our plants are highly automated, so that you get 2 or 3 or 5 percent productivity increase out of your workers and transportation goes up 1 or 2 percent, and you have lost the whole thing.

The **Chairman**. Now, we need to educate America about the importance of infrastructure, that it is a global economy issue. Do you have any suggestions on how we should do this?

Mr. **Bush**. Well, I think we certainly can mobilize the business community, and that is what the chamber represents here, and speak to that audience. Workers should be informed by their managements that their jobs are going to be less secure.

Of course, you don't want to frighten people, but educate them on the need to support infrastructure repair and renovation and improvement.

Mr. **Kelleher**. If I could add just one thing, Mr. Chairman? One of the things we are trying to do, we are going to launch a new effort out to 1,000 chambers around the country in which we are going to send them a newsletter every month, trying to highlight the role of infrastructure and transportation in economic development, in community development.

Also, we continue to try and do things to make the general public aware. Mr. Boehlert of this committee was, last week, on our public show, "It's Your Business," concerning the issue of taking the aviation trust—we have been active in the Partnership for Improved Air Travel and Aviation Roundtable to go out and let people see the link between transportation and your jobs.

Your previous witness made a very good point. We are playing catch-up, and I believe a lot of times the general public, when they see road-building taking place, when they see an addition to the airport, think that is the cause of the problem.

We need to work together with the Congress to make the public aware that is part of the solution, but that the solution is going to take some time before we get any net gains, but we are committed to it in the long run.

The **Chairman**. Well, I asked the question because obviously, I think it is a message we have to get out. I know we are going to be doing our part. We have had one hearing in the New York area, and here, and we are talking about one in California, another one up in Washington, all over the country, but we will be doing this and meeting with the business communities and the U.S. Chambers of Commerce. At the same time we are going to be working with you.

Mr. Bush and Mr. Kelleher, I want to thank you for your statement, and all the work you are doing and the chamber is doing to promote infrastructure. I thank you.

Mr. **Bush**. You have been very gracious, Mr. Chairman. Thank you.

[Mr. Bush's statement appears on page 396.]

The **Chairman**. Our last set of witnesses today are a panel of distinguished economists who have written and spoken extensively on the use of infrastructure and its impact on our economic productivity and competitiveness.

The panel includes Dr. David Lewis, Partner-in-Charge of James F. Hickling Management Consultants; Dr. David Aschauer, Senior Economist, Research Department, Federal Reserve Bank of Chicago; and Dr. Laurits Christensen, President of Christensen Associates.

I was told they were all here. Are they? We will begin with Dr. Lewis, who I understand will serve as sort of moderator for the panel.

Dr. Lewis?

TESTIMONY OF DR. DAVID LEWIS, PARTNER-IN-CHARGE, JAMES F. HICKLING MANAGEMENT CONSULTANTS, LTD., ACCOMPANIED BY DANIEL HARA, SENIOR CONSULTANT; DR. DAVID ASCHAUER, SENIOR ECONOMIST, RESEARCH DEPARTMENT, FEDERAL RESERVE BANK OF CHICAGO; AND DR. LAURITS CHRISTENSEN, PRESIDENT, CHRISTENSEN ASSOCIATES

Mr. **Lewis**. Thank you, Mr. Chairman.

We have formed this panel to offer the committee a perspective on the question of public infrastructure investment in the context of its role in promoting national economic growth.

My comments will be presented first in the form of an overview. My colleagues on the panel, Mr. Daniel Hara to my left, Dr. David Aschauer, and Dr. Laurits Christensen, will add further detail to certain points that we believe deserve special emphasis.

Our overview touches on four interrelated points that help put the role of public infrastructure in perspective: The first is that enhanced productivity is key to long-term economic growth and improved living standards.

Second, more capital investment is a critical factor in enhancing the rate of growth in productivity.

Third, both private and public infrastructure are important aspects of capital investment as a source of productivity growth.

Fourth, not all investment is good investment. Sound analysis has a key role to play in promoting America's economic future. More capital formation in general is crucial for productivity and living standards and public investment has a key role to play.

Equally important is the quality of investment. More private capital formation will generally lead to high quality investment because market forces provide firms with an incentive to channel capital dollars productively. In the public sector, on the other hand, special efforts are needed to ensure that investment dollars are used wisely. Infrastructure programs and projects must be planned in recognition of the productivity potential they can unlock for private industry.

I would like to turn to Mr. Hara and then Dr. Aschauer.

Mr. HARA. My name is Dan Hara, I am a principal with Hickling, and head of Policy Research. For the past several years, I have specialized in capital projects, including expansion of airports at Minneapolis-St. Paul and Vancouver.

I would like to address briefly the points raised by Dr. Lewis.

Enhanced productivity is key to long-term economic growth and improved living standards.

Real output, or Gross National Product, may be viewed as the number of workers in the economy times the production per worker. Future growth will come from one of these two sources—more workers, greater productivity per worker—or from both. However, both labor force growth and productivity growth have been dropping relative to past levels.

Labor force growth has slowed from as high as 2.9 percent per year in the late 1970s to a projected level of 1.3 percent between 1987 and 1998, and a further reduction in later years, between 1998 and 2011. This slowdown reflects both lower population growth and smaller increases in labor force participation.

To our misfortune, growth in U.S. productivity has also declined in relation to historical patterns. Whereas total factor productivity of the United States economy had increased by an average of 1.19 percent per year between 1913 and 1950, it actually declined by about 0.5 percent per year between 1973 and 1984.

If current trends continue, many forecasters foresee total productivity in the United States growing on average by about 1.5 percent over the next quarter-century.

When long-term forecasts of labor force and productivity growth are combined, the 25-year outlook for overall economic growth is about 2.5 percent a year. According to Professor Ralf Landau, a consulting Professor of Economics at Stanford University and a faculty member at Harvard's Kennedy School of Government, if the long-term rate of U.S. economic growth is not increased to its historic level of some 3.5 percent, the ever-greater employment opportunities and higher levels of material well-being to which most Americans have grown accustomed will no longer be possible.

An increase in the projected growth rate in overall productivity of 0.8 percent a year would be sufficient to bring overall economic growth to the level of about 3.5 percent over the long term. Although the amount may seem small on an annual basis, the compound effect over many years would be substantial.

Higher productivity would allow industry to increase its international competitiveness without sacrificing the wages of its workers.

If productivity is the key to growth, what factors are key to improved productivity? One well-known factor is the level of capital investment per worker. The more capital invested per worker, the more productive each worker can be.

Consequently, the greater the rate of investment in new capital, the greater the rate of growth in productivity. Researchers have documented a strong statistical relationship between the growth rate in capital investment per worker and the growth rate of labor productivity.

Nations with high gross capital formation display high growth rates in labor productivity and vice versa. The U.S., with the lowest growth rate in capital investment per worker among the nations of North America, Europe and Japan, has also enjoyed the lowest rate of growth in labor productivity.

The rate of capital investment is important not only for its addition to the amount of capital per worker, but for its impact on the quality of that capital. Second, there are two effects. Because new capital tends to embody the latest technology, the more rapidly new capital is added to the capital stock, the faster the average productivity will grow.

The significant, though less obvious point is that the rate of technological progress itself is dependent on the rate of capital investment. The more quickly new capital is added to the capital stock, the better the quality of that capital will be in terms of the innovative technology it embodies. This, in turn, means higher productivity and higher growth.

How is it that capital investment stimulates technological advance and productivity growth? According to Landau's research, the answer may be found in the way technological change is incorporated into capital equipment and facilities. Except for a small part devoted to basic science, research and development is seldom undertaken unless its results are expected to be applied in new facilities and operations.

Therefore, a larger rate of investment creates a market for technological improvements, spurring technological advance and improved productivity.

Considering now the role of public investment: as with private investment, the rate of public investment is important to productivity growth.

The productivity of public capital is driven by new investments. Not until 1985, when Congress authorizes a multi-billion investment program for the Nation's air traffic control system, did it also authorize the Federal Aviation Administration to begin in earnest a program of research and development in advanced automation. The research of Dr. Lewis at that time indicated that, well-managed, such a program would yield more than $36 billion in productivity improvements for airlines, business travelers and industry.

A similar example is apparent in the case of Federal highway investment. It was in association with a sizable increase in the level of Federal highway spending that Congress saw fit to authorize the Strategic Highway Research Program, a multi-million-dollar effort to find more productive pavements, construction methods and maintenance techniques.

New technology and approaches embodied in public capital investments also unlock, in turn, the application of new technologies in the private sector. New air traffic control facilities lead to innovations in aircraft management.

More generally, there is emerging statistical evidence of the influence of public capital investment on the Nation's overall rate of growth in productivity. We mentioned earlier that researchers have documented statistically a complementary relationship between gross capital investment and the rate of productivity growth.

Other researchers, such as Dr. David Aschauer on our panel, of the Chicago Federal Reserve Board, are trying to disentangle the relative influence of private and public investment and coming up with interesting results.

The findings indicate that both private and public capital investment contribute to productivity growth. There is also some statistical indication that the returns to public capital investment presently exceed private returns. But this debate partly misses the point that both private and public investment can create the economic conditions for more productivity and thus the enhanced economic growth needed to sustain living standards.

While the rate of investment in public capital is crucial, we must also be discriminating on where that investment is made. Not all investment is good investment.

In the private sector, the profit motive, combined with competitive forces, tend to ensure that the right kind of investment takes place. In the public sector, it is necessary to find a way to test and ensure that the right kind of investments are being made.

Traditionally, the practice of cost-benefit analysis is supposed to answer this need. Projects which pass cost-benefit tests are supposed to be the most worthwhile.

In principal, benefit-cost does provide the correct answers and guidelines. However, research in progress by Hickling and Christensen is asking whether cost-benefit analysis, as currently practiced, measures the full productive potential of infrastructure projects. The evidence thus far is that, under certain circumstances, it does not.

The theoretical foundations of this finding are now being completed, but in essence, the problem is one of anticipating the impact of public sector investment on private sector productivity.

For example, typical benefit-cost assessments of road improvements will measure benefits by assuming that the current overall structure of the road network is the most productive, and that the current types of vehicles traveling on the road will be unaffected.

Benefits will be measured using time and fuel savings and to existing traffic. If new road surface standards permit the design of a better truck, the benefits of this to the private sector will normally be missed. If the development of satellite navigation and dispatching of trucks requires a redesign of the basic road network, this too could be missed with current benefit-cost techniques.

In short, the current practice of benefit-cost is based on assumption of the acceptability of the status quo. Allowance for the constraints this places on the application of new technologies by the private sector, is often neglected.

Industry itself is beginning to recognize the same point. Writing in a recent issue of the Journal of Transport Economics and Policy, a logistics executive, former specialist in public investment planning and analysis of a major supermarket chain writes that, "It is doubtful whether current methods of cost-benefit assessment fully account for the benefits of network improvements, which may include structural changes in distribution logistics."

Dr. David Quarmby, the author of this quotation, cites the case of highway network improvements leading—an example—the firm to reduce the number of food distribution depots needed to service a given territory of retail outlets. The benefits arising from this restructuring arise from the economies of fewer depots providing the same level of service and an inventory saving through a reduction in the number of stocking points.

Quarmby goes on to show that benefits to commercial vehicles of road improvements, calculated as in the conventional way, as straight time savings, will tend to underestimate the true "business potential" unlocked by such improvements. In the retail distribution of food, for example, it is shown that conventional cost-benefit analysis of network improvements could understate the true benefits by 30 to 50 percent if some form of restructuring takes place.

Quarmby also notes that the move away from own-account to contract distribution creates a more responsive "market" for distribution services, and this enables distribution networks to react and adjust even more readily as changes in the road network come along. This is to indicate changes are likely to occur.

Clearly, it is important that the business and productivity potential released by infrastructure improvements be clearly understood and incorporated in our assessment of public investment opportunities. Failure to do so translates directly into a risk of sharp underinvestment and mis-investment, with consequent sacrifices in economic growth and improved living standards.

The question is, how can this potential be exposed? To be sure, more in-depth surveys and studies are needed. Additionally, however, we see the need for a great deal more interaction between Federal and state government officials, the people who plan the infrastructure, and industry itself, the people who use it.

Infrastructure planners and decision-makers need to seek out the David Quarmbys, the logistics managers and the investment planners, industry by industry. We need to find out directly how different kinds of transportation facilities will affect the way they do business.

New forms of cooperation and information-sharing between the public and private sectors are needed in order to alert those who plan the infrastructure to the radical changes occurring in U.S. industry as it grapples with the need to cut inventories, speed the flow of products, and speed product development. All these considerations underpin our ability to compete globally, and to increase our standard of living.

Mr. LEWIS. I would like to offer you a very brief summary of our overview, and the overview concludes:

Productivity growth is the key to economic growth, competitiveness, and a rising standard of living. U.S. productivity growth has fallen below historical norms, and below our international competitors. A vigorous new look at public infrastructure investment offers a way to move productivity growth back up to its accustomed levels.

In setting total levels of investment in public infrastructure, we need to be aware of the extra impact of the rate of investment on the quality of capital. Higher rates of investment stimulate innovations, which improves the productivity and effectiveness of the new capital.

In assessing projects, we need to be aware of the impact that public investment has on private sector productivity. New forms of cooperation and information-sharing are necessary to identify and account for the private sector technologies and logistics enabled by public infrastructure investment. This will lead to not only a greater revealed need for investment, but also more productive investment.

You asked earlier, Mr. Chairman, how can the role of infrastructure be ingrained in the public? We believe information-sharing includes involving the public in the assessment of the analytical process, rather than exposure to the results of studies.

More capital investment is needed, both private and public, in order to give labor and firms more productive leverage over their output. In the case of public investment, special efforts are needed to ensure that decision-makers understand the private business potential that certain kinds of infrastructure projects can unlock. Without this understanding, continued under-investment is inevitable.

I would like to turn over the proceedings now to Dr. David Aschauer.

Mr. ASCHAUER. Thank you, David.

I should emphasize what I say here today does not reflect Federal Reserve policy.

Good morning. My name is David Alan Aschauer, and my position is as Senior Economist with the Federal Reserve Bank in Chicago. As is well known, according to a number of indicators, the United States economy has not performed well in recent years, as in the so-called "golden age" of the 1950s and 1960s.

For instance, we have seen a continuing slump in the growth rate of economic productivity, measured either conventionally as output per labor hour—labor productivity—or alternatively as output per unit of combined private labor and private capital services—so-called total factor or multifactor productivity.

Beginning sometime in the early 1970s—the exact point in time is unclear—productivity growth fell off by some 1.4 percent per year; in the case of labor productivity, from 2.8 percent to 1.4 percent.

This is clearly an important development, for what it means is that rather than output per hour doubling every 26 years, if the present trend continues, we can expect productivity to double only once every 51 years. This, in turn, implies that our future consumption opportunities, on a per capita basis, will rise much more slowly as well, impacting on a wide variety of issues, such as the viability of our national social insurance programs, as well as our national military security.

Also, not only has productivity growth fallen over time in the United States, but out productivity growth has been low for the past three decades relative to our major competitors. For example, from 1965 to 1985, Japan has achieved a labor productivity growth rate in excess of 3 percent per year, and West Germany well in excess of 2 percent per years. One reflection of our low productivity growth, when coupled with persistently high consumption growth, is the yawning current account deficit and the switch, during the 1980s, from our position as the world's largest creditor to the world's largest debtor nation.

A second dimension of poor economic performance, one which is related to low productivity growth, is a low profit rate on private capital structures and equipment. The profit rate has been depressed during the 1970s and 1980s by a considerable amount from its level in the 1950s and 1960s, to about 8 percent from about 11 percent in the golden age.

A third indicator of apparently inferior economic performance, one which is closely linked to the fall-off in the profit rate, is a low rate of private net investment in new plant and machinery. The growth rate of the private capital stock has been about 3 percent per year in recent years, down from about 4 percent in the 1950s and 1960s.

Of course, there is much controversy about the validity of these facts as well as about their appropriate interpretation. For instance, there are some, like Michael Darby, who argue that there has been no true productivity slowdown; instead, what we have chosen to see in that regard is "a case of statistical myopia."

Others, such as Martin Feldstein and Lawrence Summers, would argue that there is really no long-term down trend in the corporate profit rate. And there is much controversy about whether investment really has been depressed during the 1980s; individuals like Paul Craig Roberts choose to emphasize gross, as opposed to net, investment rates, and gross investment has been relatively stable during recent years.

Finally, it is necessary to be careful about interpreting movements in productivity, in profit rates, and in investment, or, for that matter, other variables such as the current account deficit, as indicators of economic malaise. The appropriate, or optimal, rates of national savings, investment and productivity growth are inherently unobservable and may well be changing over time.

Yet I think it is clear that the economy has not been doing well in recent decades and that the typical person on the street is rightly concerned about it.

Today I would like to discuss my recent research regarding a potential link between public infrastructure expenditure and the overall performance of the economy. Specifically, I will discuss the statistical information I have accumulated, indicating that:

One, there is a robust, positive linkage between public capital—particularly infrastructure capital—and private sector productivity.

Two, there exists a positive linkage between public, nonmilitary capital and the profit rate on private nonfinancial corporate capital.

And, three, there is a long-term positive relationship between public non-military investment spending and business investment.

While I hope to be convincing, I also hope to convey a degree of restraint as well. At minimum, my results are based on past relationships, and we must be cautious in using such results in any attempt to forecast the future importance of traditional public investment to the performance of the domestic economy.

As everyone here is no doubt well aware, public expenditure on non-military capital goods—infrastructure investment in facilities such as roads, bridges, dams, mass transit, and the like—has fallen rather dramatically in the past two decades.

As the first chart shows, non-military public investment rose as a percentage of Gross National Product throughout the 1950s and 1960s, peaking at nearly 4 percent in the latter half of the 1960s.

After that time, however, such capital spending tumbled as a percent of GNP until the early 1980s, reaching a low at that time of 2 percent. By 1987, public investment had rebounded to some degree—2.2 percent—but was still below the levels attained in the 1960s.

A similar pattern exists for what I have elsewhere termed a "core infrastructure" composed of items which may be thought to have a direct and more or less immediate impact on the country's productive capacity—highways, mass transit, airports, water and sewer systems, and electrical and gas facilities; specifically, a general increase until the mid-1960s, a fall off until early 1980s, and a slight improvement since that time.

Finally, even if we take out the two largest components of non-military public investment—in highways and educational buildings—the same overall trend is apparent. I ask: How might these trends in public spending be affecting the economy?

In its simplest terms, basic production theory links primary "factors of production" to the output of goods and services. To produce, say,. the delivery of a package Federal Express requires labor: Truck drivers, airplane pilots, mail sorters; and physical capital, the associated trucks, airplanes, the "Octopus", which is Fed Ex's mechanical mail sorting machine.

Oddly, it is conventional for economists to include in the capital concept only private plant and equipment and to neglect public capital such as roads, airports and other infrastructure facilities.

In the words of Richard Bartel, editor of Challenge Magazine:

> Investment is the key, as economists know very well, to economic growth and material progress. History records how the creation of physical and human capital drives the wealth of nations.
>
> Yet even some economists tend to think of investment in narrow terms—private spending on business plant and equipment. We often forget about additions to the stock of public infrastructure—spending on roads, bridges, mass transportation, airports, waterways, water supply, waste disposal facilities and other public utilities.

As my particular example should make clear, however, this neglect is unforgivable. For what kind of product would Federal Express have were it not for the streets on which it drives its trucks, or for the airports to and from which it flies its planes? Or, for that matter, what level of profits would Federal Express have without a transportation infrastructure?

So, my basic idea linking infrastructure to the economy is simple. An adequate and well-maintained public stock of infrastructure capital is essential to the profitable and efficient production of private sector goods and services and their distribution throughout the Nation and the world.

Although my choice of Federal Express is admittedly extreme, a moment's reflection should convince you that infrastructure is important to nearly all productive units in the economy.

Consider, for example, the many and varied ways that infrastructure may be important to a clothing producer in a major city. The availability of mass transit brings with it an extensive labor pool, which supplies the firm with cheap labor. The washing and dyeing of fabrics requires a steady source of water and a reliable sewer system.

Good streets and highways as well as airports serve double duty, allowing for just-in-time inventory management as well as for easy shipment of finished product to national and international purchasers. Without public infrastructure, private production would be a difficult, if not impossible, endeavor.

Viewed from this perspective, the trends in public investment shown above are quite disturbing. As the second chart at the end of my testimony shows, while the private sector has been accumulating plant and machinery to more than match the growth in the labor force—the amount of private capital per worker nearly doubled between 1949 and 1987 from $16,000 to $31,200—the public sector capital stock has not been keeping pace with growth in the labor force.

Indeed, after peaking in 1972 at $15,300, the amount of public capital per worker has fallen to $13,500 by 1987. As the third chart shows, this means that the ratio of public to private capital stocks has slid from a high of .59 in 1964 to a low of .43 in 1987; hardly a situation of balanced growth, with the government's infrastructure keeping up with the private sector's capital building.

In a series of published papers listed in the references, I have documented the importance of infrastructure investment to the economy. Among other results, my research indicates that: One, a 1-percent increase in the stock of infrastructure capital, about $10 billion, raises the rate of return to private capital by about 10 basis points, 1/10th of a percentage point. Loosely speaking, if the government had continued to invest in infrastructure during the 1970s and 1980s at the average rate maintained between 1953 to 1970, there would have been much less of a "falling rate of profit" for economists, let alone stockholders, to worry about.

Two, such an increase in public investment spending would have had the net effect of raising the national investment rate by a substantial amount. At first, public investment in plant and machinery would have been depressed due to higher capital goods prices and real—inflation-adjusted—interest rates, but over time, the positive effect of a good infrastructure on corporate profitability would have come to dominate, private investment would have rebounded, and national investment would have climbed.

And, three, as the national investment rate then would have been higher, productivity growth—annual gains in productive efficiency—would have expanded. Investment in new capacity, private and public, makes more capital available to laborers and works to improve labor productivity.

In the words of Martin Feldstein, past chairman of the Council of Economic Advisors, "The evidence is overwhelming that countries with high rates of saving and investment are the ones in which productivity, income and the standard of living rise most rapidly." Indeed, my estimates indicate that of the total fall-off in productivity growth from 1953-1969 to 1970-1986 of 1.4 percent per year, some 57 percent, or 0.8 percent per year, can be attributed to the neglect of our infrastructure.

Just as potholes in the streets would have been hardly felt by motorists had our Nation properly invested in infrastructure, our productivity slump then would have been much less noticeable to the Nation at large.

The next three charts show how higher public investment in our infrastructure would have had these effects on the economy. In all three cases, the solid lines are actual, historical values for the profitability of private capital, for national investment, and for productivity growth in the private business economy.

The dashed lines result from taking my statistical model and simulating the effects of raising annual public investment by 1 percent of the private capital stock. As is readily apparent, the improved infrastructure would have raised profits; it would have, on net, raised national investment; and it would have boosted productivity growth. By implication, it would have dramatically improved our position in the increasingly competitive international marketplace.

While not a panacea for our longer-term economic ills, higher public investment in infrastructure would certainly be good medicine. I respectfully submit that as a country, we should swallow whatever bitter pill—higher taxes, more debt, or whatever—it takes to address this decay in our collective economic health.

Mr. **Lewis**. It is extremely important to try and measure in aggregate, as Dr. Aschauer has demonstrated, the relationship between overall changes in the rate of investment in public infrastructure and the returns to public capital, but at the same time, it is very—I think important to remember that when we make decisions on where to spend money, we do so on the basis of our assessment of individual projects, and whether they appear to offer gains that exceed the costs of implementing the projects.

And the question in this context boils down to are we reaching out when we assess these projects to try and anticipate and understand all the productivity spinoffs they are going to yield for private industry.

Dr. Aschauer is measuring in aggregate, or are we failing to capture those benefits and thus misinforming ourselves about how many of these projects are worthwhile doing? This is one of the points that Dr. Laurits Christensen will touch on, and I will ask Dr. Christensen to take the floor.

Mr. **Christensen**. Thank you, David.

My name is Laurits R. Christensen. I am President of Christensen Associates, an economic research and consulting firm based in Madison, Wisconsin. Formerly, I was Professor of Economics at the University of Wisconsin in Madison. During my professional career, I have specialized in issues related to productivity, including productivity in transportation industries.

Research conducted by myself and others has shown the central role capital formation plays in economic growth. Capital formation has been a major reason for the growth in per capita income in this century. Capital formation also leads to productivity growth through the embodiment of new technologies. Businesses discover new ways of creating products, but these new methods often require new plant and equipment.

It is the installation of this plant and equipment that unleashes the potential of the new technology. Today we are beginning to think how public infrastructure investment, which is a form of capital formation, might also unleash the potential of new technologies.

In order to undertake those infrastructure investment plans that lead to productivity and economic growth, it is wise public policy to articulate economic criteria on which projects can be appraised. Government resources are limited, and the claims on those resources are many.

Projects must be carefully reviewed in order that our Nation can receive the largest "payoff" for our limited resources. Economists refer to obtaining the maximum payoff as maximizing economic welfare.

Every day, businesses in the private sector are faced with the same type of problem: How to maximize the payoff to their limited funds. Businesses use analytical tools, such as rate of return analysis, in determining which projects to undertake.

In the public sector, cost-benefit analysis plays a parallel role. Cost-benefit analysis is designed to be an analytical tool that determines which governmental projects maximize economic welfare, that is, which projects will lead to the greatest payoff. Benefit-cost analysis has been widely used in the transportation sector, as well as other sectors.

When a business uses rate of return analysis to evaluate an investment decision, wrong conclusions can be drawn if the analysis omits some of the potential payoff. For example, if a company fails to see that its market has a potential for tremendous growth, it may decide not to undertake new investments, and ultimately lose market share to its competitors. By failing to incorporate market growth into its rate of return analysis, the company has failed to maximize its payoff.

Likewise, cost-benefit analysis will not lead to welfare maximizing investment decisions if the tools used do not incorporate the full range of impacts resulting from the investment. Research that we are presently undertaking suggests that conventionally applied cost-benefit analysis does not incorporate the full range of impacts. Today, I will relate to you some of our preliminary findings.

Public infrastructure affects many sectors of the U.S. economy. As these sectors grow and evolve, their public infrastructure needs change. Some of these processes are so complex that the conventional tools of cost-benefit analysis miss them.

For example, many manufacturing industries have turned to just-in-time inventory management. Inventories of parts and finished goods are held to minimum levels, with deliveries tightly timed. Because just-in-time inventory management reduces costs, it improves the productivity of the private sector.

In order to succeed, however, just-in-time inventory management needs a reliable transportation infrastructure. Delays in deliveries due to traffic congestion seriously undermine just-in-time inventory management. Conventional cost-benefit analysis has not yet incorporated measures of the payoffs associated with increased reliability.

Consequently, the potential exists for conventional cost-benefit analysis to discourage construction of new limited-access highways when the payoff resulting from additional transportation reliability would make such construction desirable.

The benefits of increased transportation reliability may come not only from the construction of new limited access highways, but also the construction and maintenance of bridges, highways and airports. New technologies, such as transportation communications systems, may also be useful in increasing transportation reliability and improving our productivity.

Just-in-time inventory management is not the only innovation that increases the payoff from infrastructure investment. If transportation infrastructure improvements allow firms to transport their products more quickly and more reliably, the firms can cut costs by reducing their number of distribution points. Such strategic changes in business operations are not captured by conventional cost-benefit analysis.

At this point, I should point out that not all innovations taking place in the economy will necessarily increase the payoff from infrastructure investment. While it is too early to tell the full impact, the innovations taking place in the telecommunications field may serve to reduce the payoff from infrastructure investment.

Transmission of information over the telecommunications network may to some extent replace the movement of goods and people over the transportation network. These developments will have to be evaluated along with those developments that increase the need for infrastructure.

Conventional cost-benefit analysis can also fail to systematically consider the interrelationships of different infrastructure projects. For example, a harbor improvement project and the construction of a limited access highway spur linking it may have a large payoff, if jointly undertaken.

However, neither project, undertaken in isolation, would have a positive payoff. If conventional cost-benefit analysis does not recognize this interrelationship, it will fail to draw the correct conclusion regarding their joint construction.

The lesson to be learned is not to abandon cost-benefit analysis, but to improve it. The tools of cost-benefit analysis must be refined to keep abreast of the changing nature of the U.S. economy. Research into the relationship between public capital formation and productivity growth is central to the refinement of our benefit-cost tools.

At the same time, open lines of communication between transportation planners and industrial users of public infrastructure is vital. The private sector has much to tell us about the potential uses of infrastructure. Through our greater understanding of these issues, we will be able to maximize the payoffs from our public investments and assure our Nation of continued economic growth.

Mr. Lewis. I think I would just summarize very, very briefly by emphasizing the twin points regarding the relationship between overall infrastructure investment and productivity on the one hand; the problem, we look at individuals on the other, by saying if we radically increase the public infrastructure budget over the next few years, which I think this panel uniformly believes we should, we also have to recognize the way we spend those dollars.

The decisions, project by project, will continue to hinge on project-by-project assessments, rate of return, cost-benefit type assessments. If, in making those assessments, we fail, as Dr. Christensen is pointing out, we fail to expose and identify the full range of productivity benefits, we might not be able to justify the expenditure of the fully increased budget, much as we have seen a similar problem in the use of capital dollars in the Airport and Airways Trust Fund.

So, I think we have a very practical problem to deal with here.

With that, I think I will end our formal presentation.

Mr. Borski [presiding]. Thank you very much.

I would like to ask one question to start with, if I may. Do you have any suggestions on how we could increase spending for public infrastructure?

Mr. Lewis. I don't know whether to field that one or take it on myself. I think the important point here is to concern ourselves less with the sources of finance, and initially with whether an investment would have substantial payoffs.

Most of us, if we see an investment on the street, we think it is a good deal, we will scramble and find the money somewhere, and that is the central point. Today, large increases in infrastructure investment, if properly channeled, will yield very large returns.

Sources of finance, I think, will come easily, relatively more easily than we might believe from user charges, form user financing, if we do a good job in convincing the public that the projects do and will yield important returns to society, to people as communities and as individuals.

And I think by involving individuals in the very planning process, both at the Federal level and in—at the project level of the State and local level, people can be convinced.

In our own work, what we do—when we go out to do cost-benefit studies of new runways and so on, we try to involve large groups of members of the general public in different—with different points of view about whether growth is a good thing or bad thing.

We try to involve them in establishing the very forecasting assumptions and technical functions as we go along. And they help us to put them in the oven and take them out of the oven.

We usually demonstrate that the payoff of infrastructure is largely worthwhile in social and economic terms to the community.

We tend to build consensus for growth. That brings forth a willingness to finance projects through the user financing, user fee mechanism.

So, I think a large proportion of the finance will come from that, and should come from those sources, if indeed we can convince the public, as we believe infrastructure to be a socially very worthwhile investment.

Mr. **Hara**. I wonder if I could respond by really responding to a question posed to previous speakers? One was how can we promote a better understanding for the need for public infrastructure investment?

This business about the blind spot of cost-benefit analysis on the one hand seems quite technical, but in reality, what we are speaking to is a blind spot that exists generally, and the same consultation and information-sharing process we are suggesting with the private sector to identify those technologies that are being held back, these missing technologies will bring the public and private sector joint awareness into the public forum of what is being missed.

It is very easy because of the current structure of infrastructure to focus on the bottlenecks. As economists, it is that consultation that will build constituencies and therefore, the political will for funding.

Mr. **Aschauer**. I would like to stress, if I could, that we need to take a long-range view on the economy and consequently on tax revenue. I have not generated the numbers, but a logical implication of the significant impacts I am getting for economic activity, would be similar impacts on tax revenue growth, and would say to a large extent such public investments in critical areas would be largely self-financing.

This is true regardless of whether or not they are being financed as we go along through user charges, but through the generation of expanded activity and expanded tax base and revenues therefrom.

I don't have those numbers, but they can be generated.

Mr. **Borski**. I guess I don't want to belabor this point. My question is further, we have a user fee now for the highway, for gasoline taxes. Many of us—or most of us believe that money is being misused or not used for infrastructure needs, but is in fact being used for the general funds.

I don't know how we could ask for higher gasoline taxes, for instance, when we can't guarantee the users, the people who are paying that tax will ultimately gain the benefit.

Mr. **Christensen**. Perhaps there is the opportunity to tie those two things together. As you know, energy taxes in general, and gasoline taxes, are particularly far lower than practically any country in the world.

There is ample opportunity, but as I say, I think part of raising taxes, raising revenues from that source, there should be—should be provision made to see they are spent where the public believes they should be spent, rather than diverted to other uses.

Mr. **Aschauer**. In regard to the gasoline tax, I would like to make two additional points: One, not only is the gasoline tax low in the United States relative to foreign countries, but we have seen a reduction in the real value of the gasoline tax over the last 20 years. It is substantially below what it was in 1960.

The second point is we have to recognize, in essence, we are talking about two taxes. We are not just talking about one tax or raising one tax, but we are talking about balancing off two taxes. One tax, the tax on gasoline; another tax, the congestion tax, if you will.

There are private factors of production that aren't being fully utilized. That is causing a drag on productivity and having the same effect on market activity, such as any distortional tax, such as a gasoline tax.

A particularly bad aspect about the gasoline tax, however, is it doesn't generate any revenue. So, I certainly believe we are past the point of equalizing the tax burden in terms of the congestion tax and gasoline tax, and it would be appropriate policy now to raise the gasoline tax.

Mr. BORSKI. My fear, and I can expect many of my colleagues' fear here, is the gasoline tax may be raised for other general fund purposes. Do you have a comment on that?

Mr. ASCHAUER. I would certainly emphasize it should be used to finance transportation investments. I am not enamored by the idea it go solely to highways. Maybe mass transit.

Mr. LEWIS. I think that has to come first is a demonstration of the fact that the projects to which these funds would and ought to be devoted, whether they be highway projects or airport projects, or other transportation projects, are likely to yield extremely important gains of socially—socially and economically, gains that are not being identified and advertised very well at all today.

And I think the skimming of funds for general fund purposes, the risk of that could be minimized with—through the development of solid constituencies in favor of investments built upon a hard-nosed, very practical demonstration of the kind of benefits that would be forthcoming.

I would only add one point. A witness earlier this morning talked about building upon our environmental and our educational infrastructure as well. The education infrastructure is the involvement of the business community and the general public, those outside the transportation decision-making and planning community, in the decision-making process. It is so much easier to see the practicalities, the gains from these projects which are involved in their analysis, and there are ways and means of promoting that involvement today.

Secondly, on the environmental side, there are sharp conflicts. When we go out to and analyze the merit of adding new runways to highly congested airports, time and time again, we run into very sharp and articulate and effective opposition from environmental groups.

These groups need to be brought into the analytical process as well, in order to demonstrate that they gain as well as lose from these investments.

And, finally, when the business community is exposed to the very large gains it is likely to reap from infrastructure investment, they begin to, I think, recognize an incentive on their part to help compensate those who lose.

We did some work for an airline in the Midwest on the question of whether it was worthwhile to the airline to pay more landing fees in order to finance the construction of a new runway.

What we demonstrated to the airline was the profits in the first three or four years of new runway operation, profits to them in the form of fuel savings generally, but also labor savings, was so vast, in this case in excess of $1 billion over the first five years of the investment.

In looking at the noise cost to those householders that were likely to bear some property depreciation as a result of the new noise, was approximately in the range of $40 to $60 million. That is compared to $1 billion in new profit. The airline says, why shouldn't we be involved in helping to compensate those individuals, because in that way, we can overcome a barrier to reaping these very large economic gains, to us as a business, which in turn translates—this is the public policy point—to very important gains to the economy.

I think people have to be brought into this analyzing process in order to recognize the potential from infrastructure and to build the consensuses needed to find a way ahead to overcome obstacles.

Mr. BORSKI. I want to ask one other question along this line, if I may, and that is, obviously, we can't consider the infrastructure in a vacuum. There is a whole economic problem here today in trying to resolve our budget deficit and budget problems.

How can we increase awareness and increase spending if that is what it takes in infrastructure, when we are facing this other dynamic of trying to reduce the budget deficit to hit the Gramm-Rudman targets?

Mr. ASCHAUER. Again, I would stress, we have to take a long-term view on these issues, and we respond yearly to particular deficit needs in terms of reducing expenditures to the detriment of long-term productivity growth. Five years, 10 years, 15 years down the line, we are going to be in a much worse situation.

There has been some interest by economists, but also by certain legislators in using the Social Security Trust Funds in order to directly finance infrastructure expenditures. I would think that would be something we should be looking to, in addition to gasoline taxes.

The crucial point in regards to Social Security, is that what is really important for the ultimate viability of the Social Security System is a strong economy in 20, 30 years, when the baby boomers begin to retire. The mere accumulation of paper certificates is not going to provide the consumption opportunities both to the retirees and to the work force at that time.

We need to have a strong economy at that time in order to finance that consumption. One way we could do that is by utilizing the Social Security funds.

Mr. LEWIS. As you may know, there are certain economists who believe the deficit as currently accounted for is somewhat misleading, because capital is treated as an annual expense, rather than as a capital expense.

Professor Eisner of Northwestern has shown, using his certain analytic assumptions, that if you move the capital count into a separate account, that the deficit doesn't look as large as it would otherwise appear.

I think the point here is that capital spending, which may have to be deficit or deficit-financed, yields returns, whereas current account spending does not. I think this is a similar point to that of David Aschauer. Again, that is an educational process.

Perhaps accounting process, if not changing the structure of the federal budget, at least allowing through special analyses for the effects of capital on the deficit in the context of infrastructure spending.

And, finally, perhaps ultimately moving certain types of capital expenditure off-budget gain, which would be consistent with the use of Social Security Trust Funds for infrastructure investment.

Mr. BORSKI. Mr. Christensen, I see you wanting to comment.

Mr. CHRISTENSEN. I wanted to underscore these points, and say I don't see there is any logical inconsistency between reducing the budget deficit and simultaneously making productive investments in our infrastructure, and I think those are twin goals that this committee, in particular, could make a contribution towards pursuing simultaneously.

If the returns that have been estimated by colleagues here, and others, for infrastructure investments are anywhere near being on mark, the returns from these additional investments could well serve to reduce the deficit, rather than to increase it.

And, finally, given this possibility that there is going to be an increase in fuels taxation in any case, certainly there could be simultaneously some of those funds used to reduce the deficit, some of the funds used to increase public infrastructure investment; and I think, given that, as economists have pointed out for a long time, consumption taxes tend to have—be more favorable for economic growth than other kinds of taxes.

Having a gasoline increase that would serve those dual purposes has a lot to recommend it.

Mr. BORSKI. Dr. Aschauer, would you—I take it, Dr. Christensen, some of the money from increased gasoline tax could be used for deficit reduction, perhaps. Would you agree with that, or do you think we need to keep it all for infrastructure?

Mr. ASCHAUER. My belief is political equilibrium will be such that if a gasoline increase is enacted, a substantial part of that will have to be for the purpose of deficit reduction.

At the same time, it is my personal view these taxes which are being generated for the purpose of increased transportation investment should be used for that purpose.

Mr. BORSKI. Thank you, Mr. Chairman.

The CHAIRMAN [presiding]. I have one question here.

What factors should we consider in drafting a national infrastructure program that would aid in promoting economic growth, productivity and competitiveness? Take your pick, any one of you.

Mr. LEWIS. I guess we can just go down the line. I would start by reiterating points made already. I think one factor, one critical factor is the need to recognize in a practical way the huge private gains in productivity that public infrastructure investments, improvements to limited highway networks, airports and so on, networks improvements generally can unlock.

Network improvements are typically assessed in terms of their benefits in the form of time savings, but we—and reductions in delay. And indeed, reductions in delay can be enormous. Two airports I have just worked with recently, adding a runway in each would save passengers at each airport an equivalent of $4 billion in fuel cost and delays, but we also have to understand that these investments permit industry to change production technologies, to adopt modern logistics, to adopt just-in-time inventory delivery systems, or to use those systems more effectively, and these benefits are very large in relation to the traditional gains we attribute to infrastructure investment.

I think if that one factor is recognized alone, the amount—the volume of funds we commit to infrastructure programs over the next 20 years would increase by 50 to 100 percent. I think to ensure those gains, or the importance of those gains are recognized, important improvements in the way we look at projects, the way we interact with industry in order to understand the kind of productivity gains that infrastructure improvements do unleash, is terribly important.

David?

Mr. **Aschauer**. I think that in terms of a plan, that it requires really three components if we are talking about linking infrastructure to productivity. First of all, it has to involve transportation, that is the leading edge of the linkage between infrastructure and productivity. We had a variety of examples in terms of just-in-time inventory arrangement, where tremendous productivity gains are feasible if adequate transportation is being made.

Second, in terms of the overall plan in terms of hard dollar outlays, we should be focusing on rehabilitating and expanding the existing stock of transportation capital, particularly in highly-congested urban areas.

Even the Congressional Budget Office, which tends to be less pessimistic about infrastructure needs than other organizations, indicates benefits and rates of return to public investments in the 40 percent range in highly-congested urban areas.

Third, before we jump into large-scale investments in other transportation facilities or other infrastructure facilities, I think we really need to sit down and research, have an intensive period of research here to be able to adapt infrastructure provision to the changing needs of the economy. In particular, we need to adapt to the demographic changes that are going to be seen over the next 20 to 30 years.

The aging of the baby boomers will have a positive impact as the workers in the labor force will be becoming more experienced. As a negative impact, we will have slower labor force growth, which is to say productivity has to be emphasized even more to get increases in output.

Another future shift that we need to be taking into consideration is the gradual long-term shift away from manufacturing and into services. It will continue even if infrastructure investment is made to try to offset the shift. The key here is a long-term tendency in the economy away from the need for movement of goods and toward the need for movement of information.

That would suggest to me, we should be studying investments in communication networks, telecommunications, in air transport, high-speed rail that was mentioned a couple of times today, as well as in revitalizing some of our sea transport facilities.

To summarize it, it is clearly transportation in terms of our overall infrastructure investments which is of most importance to our productivity. I find that in my work. I would say we also have to make sure the types of investments we are making over the next 10 to 15 years in transportation will be able to meet these changing needs.

The CHAIRMAN. How much of the recent productivity slowdown can be explained by inadequate public works infrastructure investment?

Mr. ASCHAUER. My empirical results indicate that of the total fall-off in productivity growth of 1.4 percent per year, that roughly 60 percent of that, or .8 percent per year, can be attributed to our low investment in infrastructure, and in particular, transportation infrastructure. I want to be careful about this.

You phrase the question, how much of our productivity slump can be attributed to the fall-off in public investment. That is my answer to that question.

A related question, which is very important, is how much of the productivity slowdown is to be attributed to the fall-off in public investment? I want to emphasize I am convinced, based on all of my results, that there is a true causal relationship moving from public investment to productivity to profitability to net investment and private plant and equipment, but there is controversy about that in the academic literature, so that the exact magnitude of the effect may be somewhat smaller than that 60-percent figure I gave.

The CHAIRMAN. Can greater levels of public works infrastructure investment explain the higher rates of productivity growth enjoyed by other industrialized nations, such as Japan and West Germany? I think you touched on that a little bit once there.

Mr. LEWIS. We think that it probably can, but I would like to look at the more general question, and that is, whether higher rates of capital formation generally in other nations explain or can be seen to explain the higher rates of productivity relative to rates of growth and productivity in the U.S., and the work of a number of practicing analysts, economists, demonstrate that the answer to that is yes.

While the U.S. still appears to enjoy in an absolute sense the highest level of labor productivity among the industrialized nations, our rate of growth in productivity lags substantially behind that of West Germany, Japan and the nations of Europe.

And there appears to be a strong indication that the higher rate of growth in productivity is directly linked to a higher rate of growth in investment, private and public, generally in those nations, a phenomenon that might well be linked to the high level of savings in those nations that makes more dollars at lower interest rates for capital formation.

Within that overall framework and the work Dr. Aschauer and others seem to suggest, that public capital investment is important, just as is private capital formation in that overall process. So, I think the answer to your question is generally a resounding yes, and that the—not just public works infrastructure investment, but for capital formation generally.

Mr. **Aschauer**. I would want to say that in one of the papers which is listed in the references to my testimony, I did look in some detail at the data for the Group of Seven highly industrialized economies. What is clear there, is that across those seven countries, across the time period 1965 to 1985, public investment in non-military capital has a large role to play in explaining the productivity differences across those countries, just as does private investment.

I would want to go further and say we are talking about competitiveness. We can think about a whole list of items that are good indicators of our competitive position in the world economy.

To me, the one indicator which is most attractive is export performance. If we look at the export performance of the United States versus Japan and West Germany, we see exports have been growing much faster in Japan and West Germany. We see a diminishing total share of exports coming from the United States.

We ask, what is of extreme importance for export performance? As it turns out, there is a very strong statistical relationship between investment, both public and private, productivity, and export performance.

Countries that are doing well along productivity lines are going to be countries capturing a larger share of the international market. Step that back one step further, and I find strong evidence that suggests that public investment is important for productivity, both directly as it helps move private resources at a quicker pace, but also indirectly in that it influences the profitability of private investment. Specifically, it encourages more private investment, which in turn impacts positively on productivity. I see that there is certainly interesting, and to me fairly persuasive, evidence looking across countries that our low rate of public investment has been a contributor to our lack of competitiveness and export performance.

Mr. **Lewis**. There has been a presumption over the last 10 years, and I have been a party to its—to the development of this presumption, that America's infrastructure is largely in place, and the priority now should be on looking after it. And indeed, there has been a major shift in federal budgetary allocations from new construction, additions to the highway network, to the aviation network, and into the maintenance and repair of what we have.

But more recent work suggests perhaps that presumption is somewhat misplaced. As important as it is to take care of what we have, that what industry, what business, and what services are thirsting for in terms of enhancing their own productive capabilities is, in fact, additions to the networks, making the interstate system more extensive, the airport system and air traffic control system more extensive, because it is network improvements rather than just repair to existing networks that provide firms with the facility and ability to adopt more modern and innovative inventory, so-called just-in-time delivery techniques to reduce number of depots to service given amounts of territory.

In the food distribution operation, for example, it is network improvements that facilitate those kinds of productivity gains.

And yet, in the allocation of dollars between extensions to the basic infrastructure network versus repair and reservicing of what we have tended to shift away. Our basic philosophy is, what we have is what we need, yet we seem to be on the crest of a new wave of industrial logistics and production processes where reliability, predictability of transportation is very important, and those factors are very much a factor of not only pay for services that are in good repair, but of extensions to the network in order to improve the reliability and predictability and use of those networks.

I think we have to look at our basic philosophy as we restructure the infrastructure programs for the next 25 or 30 years.

Mr. **Hara**. If I could add, in answering that question, I wouldn't want to lose track of the obvious, all these individual studies, such as the one Dr. Aschauer cited, all those slide studies are direct evidence of where productivity can be enhanced. The time and fuel savings of those individual investments come out in more productivity and would go to close the gap in productivity growth.

There are many individual studies showing those high rates of return.

The **Chairman**. My last question is one that you almost answered each time you said something about it. I am going to do it anyway.

What is known of the role that infrastructure can play in promoting economic growth and competitiveness?

Mr. **Lewis**. What we know, I guess I would want to describe on two levels. There are certain things we know with a great deal of certainty. We know, for example, that reducing congestion and delay, which is a chronic problem in the highway and aviation and waterway systems of our country, reducing congestion and delay brings enormous gains to industry, to users and to non-users, because gains to industry help reduce costs and prices, which filters through to the price and goods and services on the shelves of our shops and supermarkets and so on.

What we don't tend to do a real good job in is advertising the size of those gains. We as practicing economists have been surprised in the last two or three years. We have looked at two or three airports to assess the economy gains. We kept checking our sums over and over again, because we found by adding a new runway at Minneapolis-St. Paul, the benefits alone exceed $4 million just in terms of time savings to business travelers and fuel savings to airlines.

We checked that over and over again. We also looked at Vancouver, British Columbia. There again, just over $4 billion dollars against the cost of constructing a new runway of about $100 million.

So, the returns are not just large in relation to their cost, they are massive. That is a micro-example of the kind of returns that David Aschauer is measuring in the aggregate. I don't think we—I think we know the role infrastructure can play in that sense.

I don't think we are doing a good job of telling other people what we know.

At another level, and this is where we are only beginning to scratch the surface of what we know, the impact, not so much the first round of impact, what is the value of these time savings and reductions in delay in terms of fuel and airline tickets and so on, but what gains will these improvements yield to industry, because they can adopt more productive techniques, because they can go to a just-in-time inventory, because they can reduce the number of distribution depots from 10 to 7, because of a series of network improvements in the urban area where they reside.

You get seven depots doing the work of 10. You are holding newer inventories, your stocking points have gone down and inventories have gone down. Inventory costs are a huge component of the cost of a loaf of bread on the shelf.

We haven't done a good job of identifying the value of those gains. When we add them to what we already know to be massive gains, they are going to be that much larger a gain, and I think the onus of us all is to get out of the ivory tower and make the phenomenal size of these gains apparent.

As a very brief footnote, we went through an interesting exercise in Vancouver, where we tried to quantify the value of the noise cost the community would bear. They were huge, $60 million. But in relation to the benefits of $4 billion, they were absolutely minute.

And it triggered the community. And the same has been true in Minneapolis, saying we can't ignore gains of $4 billion, nor can we ignore those who lose, what we are going to do about it? How can we bridge this problem and get on with economic development?

I think getting into the community is everything at this point, with what we know.

Mr. **Aschauer**. I would like to underscore the fact that at least in certain areas, returns from additional public investments are as David says, huge or enormous. I would also like to reflect momentarily on the reason—or one of the reasons—that economists have done a poor job in conveying the importance of public investment to the populace and the politicians for productivity, for long-term profitability, and for investment. I think that is because of the traditional way macro-economists view the operation of the economy, particularly the effects of the fiscal policy on the economy, which is a demand-side orientation. Here a dollar of spending is a dollar of spending, and it really doesn't matter what the government is spending on.

The crucial aspect of any analysis is that the focus of the effects of fiscal policy on the economy is being shifted to the supply side or the productive side of the economy, where intuitively it should make good sense what we spend on, is extremely important for behavior of productivity.

Mr. **Borski**. The question I asked of Dr. Aschauer, in your testimony, you suggested we should do whatever is necessary to increase spending on infrastructure, including higher taxes. Do you have a figure in mind?

Mr. **Aschauer**. For taxes?

Mr. **Borski**. For taxes, or how much should be spent?

Mr. **Aschauer**. I think the rule of thumb which has been bandied about—namely, the National Council on Public Works Improvement is advice for increased funding—to double the level of infrastructure expenditures, is an appropriate rule of thumb. That is, we are talking about $50 billion, to my recollection. That would then require a substantial increase in revenues if we are not going to be utilizing the Social Security Trust Funds for the purpose.

A general rule of thumb on the gas tax is that a penny increase in the gas tax would generate a billion-dollar increase in revenue. I would not like to see a 50-cent increase in the gas tax. I would like to see an increase in the gas tax of perhaps 20 cents.

Mr. **Borski**. Okay. I guess I repeated an earlier question. If we were going to increase gasoline tax by 20 cents, you would feel we should spend that all on transportation?

Mr. **Aschauer**. That is the point. I would say $20 billion of that additional $50 billion would be best spent on transportation facilities, and the gas tax would be used more or less for that purpose alone.

Mr. **Borski**. Thank you.

The **Chairman**. Some of our minority members weren't able to make it, and I am told probably within a week they will be giving us some questions, so we will probably be directing some additional questions to you that will be included in the record sometime within the coming week.

I want to thank the panel for their testimony and for making complex issues more understandable.

This has been a good and productive hearing, and I want to thank you very much for your part in it.

The next issue, we won't talk about it today, but we will be looking at how we will be financing our infrastructure.

I want to thank all the witnesses, and I want to thank particularly this panel, and the meeting is adjourned.

[Whereupon, at 2:10 p.m., the committee was adjourned.]

[Mr. Lewis' and Mr. Hara's statement appears on page 414.]

[Mr. Aschauer's statement appears on p. 385.]

New Add (1992)

PREPARED STATEMENTS OF WITNESSES

"Infrastructure and America's Economic Future"
Committee on Public Works and Transportation
U.S. House of Representatives
June 13, 1990

Good Morning. My name is David Alan Aschauer, and my position is as Senior Economist with the Federal Reserve Bank of Chicago.

As is well known, according to a number of indicators the United States economy has not performed as well in recent years as in the so-called "golden-age" of the 1950's and 1960's.

For instance, we have seen a continuing slump in th growth rate of economic productivity, measured either conventionally as output per labor hour--labor productivity--or alternatively as output per unit of combined private labor and private capital services--so called total factor or multifactor productivity. Beginning sometime in the early 1970's--the EXACT ~~specific~~ point in time is quite unclear--productivity growth fell off by some 1.4 percent per year; in the case of labor productivity, from 2.8 percent to [redacted] 1.4 percent. This is clearly an important development, for what it means is that rather than output per hour doubling every 26 years, if the present trend continues we can expect productivity to double only once every 51 years. This, in turn, implies that our future consumption opportunities, on a per capita basis, will rise much more slowly as well, impacting on a wide variety of issues such as the viability of our national social insurance programs as well as our national MILITARY security.

Also, not only has productivity growth fallen over time in the United States, but our productivity growth has been low for the past three decades relative to our major competitors. For example, from 1965 to 1985, Japan has achieved a labor productivity growth rate in excess of 3 percent per year, and West Germany well in excess of 2 percent per year. One reflection of our low productivity growth, when coupled with persistently high consumption growth, is the yawning current account deficit and the switch, during the 1980's, from our position as the world's largest creditor to the world's largest debtor NATION.

A second dimension of poor economic performance, one which is related to low productivity growth, is a low profit rate on private capital structures and equipment. The profit rate has been depressed during the 1970's and 1980's by a considerable amount from its level in the 1950's and 1960's--to about 8 percent from about 11 percent in the golden age.

A third indicator of apparently inferior economic performance, one which is closely linked to the fall-off in the profit rate, is a low rate of private net investment in new plant and machinery. The growth rate of the private capital stock has been about 3 percent per year in recent years, down from about 4 percent in the 1950's and 1960's.

Of course, there is much controversy about the validity of these facts as well as about their appropriate interpretation. For instance, there are some, like Michael Darby, who argue that there has been no true productivity slowdown; instead, what we have chosen to see in that regard is "a case of statistical myopia." Others, such as Martin Feldstein and Lawrence Summers, would argue that there is really no long-term downtrend in the corporate profit rate. And there is much controversy about whether investment really has been depressed during the 1980's--individuals like Paul Craig Roberts choose to emphasize gross, as opposed to net, investment rates and gross investment has been relatively stable during recent years. Finally, it is necessary to be careful about interpreting movements in productivity, in profit rates, and in investment--or, for that matter, other variables such as the current account deficit--as indicators of economic malaise. The appropriate, or optimal, rates of national savings, investment, and productivity growth are inherently unobservable and may well be changing over time.

Yet I think it is clear that the economy has not been doing well in recent decades and that the typical person on the street is [redacted] concerned about it.
rightly

Today I would like to discuss my recent research regarding a potential link between public infrastructure expenditure and the overall performance of the economy. Specifically, I will discuss the statistical information I have accumulated indicating that:

1) there is a robust, positive linkage between public capital--particularly infrastructure capital--and private sector productivity;

2) there exists a positive linkage between public nonmilitary capital and the profit rate on private nonfinancial corporate capital; and

3) there is a long-run positive relationship between public nonmilitary investment spending and business investment.

While I hope to be convincing, I also hope to convey a degree of restraint as well. At minimum, my results are based on past relationships and we must be cautious in using such results in any attempt to forecast the future importance of public investment to the performance of the domestic economy.
Traditional

[redacted]

As everyone here is no doubt well aware, public expenditure on nonmilitary capital goods--infrastructure investment in facilities such as roads, bridges, dams, mass transit, and the like--has fallen rather dramatically in the past two decades, [redacted] As the first chart shows, nonmilitary public investment rose as a percentage of gross national product throughout the 1950's and 1960's, peaking at nearly 4 percent in the latter half of the 1960's. After that time, however, such capital spending tumbled as a percent of GNP until the early 1980's, reaching a low at that time of 2 percent. By 1987, public investment had rebounded to some degree--2.2 percent--but was still well below the levels attained in the 1960's. A similar pattern exists for what I have elsewhere termed a "core infrastructure" composed of items which may be thought to have a direct and more or less immediate impact on the country's productive capacity (highways, mass transit, airports, water and sewer systems, and electrical and gas facilities); specifically, a general increase until the mid-1960's, a fall off until early 1980's, and a slight improvement since that time. Finally, even if we take out the two largest components of nonmilitary public investment--in highways and educational buildings--the same overall trend is apparent. I ask: how might these trends in public spending be affecting the economy?

[redacted]

In its simplest terms, basic production theory links primary "factors of production" to the output of goods and services. To produce, say, the delivery of a package Federal Express requires labor--truck drivers, airplane pilots, mail sorters--and physical capital--the associated trucks, airplanes, the "Octopus" (this is Fed Ex's mechanical mail sorting machine). Oddly, it is conventional for economists to include in the capital concept only private plant and equipment and to neglect public capital such as roads, airports and other infrastructure facilities. As my particular example should make clear, however, this neglect is unforgivable. For what kind of product would Federal Express have were it not for the streets on which it drives its trucks, or for the airports to and from which it flies its planes? Or, for that matter, what level of profits would Federal Express have without a transportation infrastructure?

So, my basic idea linking infrastructure to the economy is simple. An adequate and well maintained public stock of infrastructure capital is essential to the profitable and efficient production of private sector goods and services and their distribution throughout the nation and the world. Although my choice of Federal Express is admittedly extreme, a moment's reflection should convince you that infrastructure is important to nearly all productive units in the economy. Consider, for example, the many and varied ways that infrastructure may be important to a clothing producer in a major city. The availability of mass transit brings with it an extensive labor pool, which supplies the firm with cheap labor. The washing and dyeing of fabrics requires a steady source of water and a reliable sewer system. Good streets and highways as well as airports serve double-duty, allowing for just-in-time inventory management as well as for easy shipment of finished product to national and international purchasers. Without public infrastructure, private production would be a difficult--if not impossible--endeavor.

Viewed from this perspective, the trends in public investment shown above are quite disturbing. As the second chart shows, while the private sector has been accumulating plant and machinery to more than match the growth in the labor force--the amount of private capital per worker nearly doubled between 1949 and 1987 from $16,000 to $31,200--the public sector capital stock has not been keeping pace with growth in the labor force. Indeed, after peaking in 1972 at $15,300, the amount of public capital per worker has fallen to $13,500 by 1987. As the third chart shows, this means that the ratio of public to private capital stocks has slid from a high of .59 in 1964 to a low of .43 in 1987; hardly a situation of balanced growth, with the government's infrastructure keeping up with the private sector's capital building.

In a series of published papers listed in the references, I have documented the importance of infrastructure investment to the economy. Among other results, my research indicates that:

1) a 1 percent increase in the stock of infrastructure about $10 billion capital raises the rate of return to private capital by about 10 basis points (1/10th of a percentage point). Loosely speaking, if the government had continued to invest in infrastructure during the 1970's and 1980's at the average rate maintained between 1953 to 1970, there would have been much less of a "falling rate of profit" for economists--let alone stockholders--to worry about;

2) such an increase in public investment spending would have had the net effect of raising the national investment rate by a substantial amount. At first, private investment in plant and machinery would have been depressed due to higher capital goods prices and real (inflation-adjusted) interest rates, but over time the positive effect of a good infrastructure on corporate profitability would have come to dominate, private investment would have rebounded, and national investment would have climbed; and

3) as the national investment rate then would have been higher, productivity growth--annual gains in productive efficiency--would have expanded. Investment in new capacity--private and public--makes more capital available to laborers and works to improve labor productivity. In the words of Martin Feldstein, past chairman of the Council of Economic Advisors, "the evidence is overwhelming that countries with high rates of saving and investment are the ones in which productivity, income, and the standard of living rise most rapidly." Indeed, my estimates indicate that of the total fall-off in productivity growth from 1953-69 to 1970-86 of 1.4 percent per year (1953-69 = 2.8 percent and 1970-87 = 1.4 percent) some 57 percent-- or 0.8 percent per year--can be attributed to the neglect of our infrastructure. Just as potholes in the streets would have been hardly felt by motorists had our nation properly invested in infrastructure, our productivity slump then would have been much less noticeable to the nation at large.

The next three charts show how higher public investment in our infrastructure would have had these effects on the economy. In all three cases, the solid lines are actual, historical values for the profitability of private capital, for national investment, and for productivity growth in the private business economy. The dashed lines result from taking my statistical model and simulating the effects of raising annual public investment by 1 percent of the private capital stock. As is readily apparent, the improved infrastructure would have raised profits; it would have, on net, raised national investment; and it would have boosted productivity growth. By implication, it would have dramatically improved our position in the increasingly competitive international marketplace.

While not a panacea for our longer term economic ills, higher public investment in infrastructure would certainly be good medicine. I respectfully submit that as a country we should swallow whatever bitter pill--higher taxes, more debt, or whatever--it takes to address this decay in our collective economic health.

Statement of the U.S. Chamber of Commerce

ON: INFRASTRUCTURE AND AMERICA'S ECONOMIC FUTURE

TO: HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

BY: JOHN S. BUSH, JR.

DATE: JUNE 13, 1990

The U.S. Chamber of Commerce is the world's largest federation of business companies and associations and is the principal spokesman for the American business community. It represents nearly 180,000 businesses and organizations, such as local/state chambers of commerce and trade/professional associations.

More than 92 percent of the Chamber's members are small business firms with fewer than 100 employees, 59 percent with fewer than 10 employees. Yet, virtually all of the nation's largest companies are also active members. We are particularly cognizant of the problems of smaller businesses, as well as issues facing the business community at large.

Besides representing a cross section of the American business community in terms of number of employees, the Chamber represents a wide management spectrum by type of business and location. Each major classification of American business--manufacturing, retailing, services, construction, wholesaling, and finance--numbers more than 10,000 members. Yet no one group constitutes as much as 32 percent of the total membership. Further, the Chamber has substantial membership in all 50 states.

The Chamber's international reach is substantial as well. It believes that global interdependence provides an opportunity, not a threat. In addition to the 59 American Chambers of Commerce Abroad, an increasing number of members are engaged in the export and import of both goods and services and have ongoing investment activities. The Chamber favors strengthened international competitiveness and opposes artificial U.S. and foreign barriers to international business.

Positions on national issues are developed by a cross section of its members serving on committees, subcommittees and task forces. Currently, some 1,800 business people participate in this process.

STATEMENT
on
INFRASTRUCTURE AND AMERICA'S ECONOMIC FUTURE
before the
HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
for the
U.S. CHAMBER OF COMMERCE
by
JOHN S. BUSH, JR.
June 13, 1990

I am John S. Bush, Jr., Vice President, Governmental Affairs for the USG Corporation. My appearance today is on behalf of the U.S. Chamber of Commerce, where I serve as a member of the Construction Action Council. Accompanying me is William D. Kelleher, the Chamber's Manager for Community Resources. The Chamber appreciates this opportunity to express its views on the state of the nation's surface transportation infrastructure and America's economic future.

America's transportation infrastructure is crumbling. Decaying and overburdened roads, bridges, highways, airports, waterways and railroads are robbing the nation of economic vitality. Mobility--the ability to move people and goods--has always been important to the U.S. because of its size and dispersion of economic activity. In a global economy, an efficient and cost-effective transportation network is a key to international competitiveness.

As economic boundaries disappear and economic opportunities develop overnight, the U.S.'s ability to move people and goods quickly will play a major role in shaping its economic future.

In the 1950s and 1960s, America had a transportation network that was the envy of the rest of the world. This network played an important role in enhancing productivity and keeping costs low. In contrast, today the U.S. faces a gridlock crisis in its transportation network.

Mr. Chairman, the Chamber specifically urges the Committee to:

- Put the trust back in the transportation trust funds by spending the funds' existing surpluses;
- Ensure the continued financial integrity of the trust funds by taking them off-

budget;

- Oppose efforts to usurp transportation user fee revenues for other purposes;
- Support a federal leadership role in establishing a national transportation system;
- Enhance options for public-private partnerships and privatization; and
- Consider establishing an infrastructure bank and using capital budgeting concepts to better manage infrastructure spending.

Causes

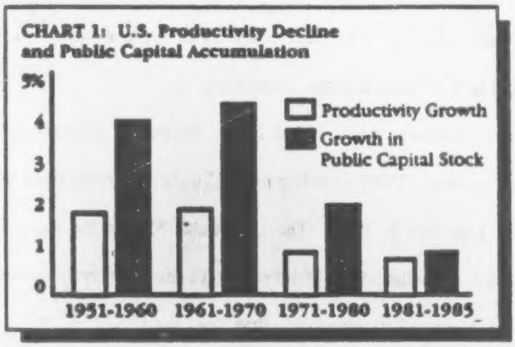
America's transportation infrastructure crisis is the result of six major trends: suburban development, economic relocation, demographic and labor force changes, increased automobile use, reliance on trucks, and lack of infrastructure investment.

By almost every measure, the U.S. has been reducing its investment in infrastructure. As a share of gross national product (GNP), spending on public capital has dropped from 2.3 percent of GNP in 1960 to less than 1.1 percent in 1985. The U.S. ranks 55th in the world in capital investment in infrastructure. It spends a smaller share of its resources on highway investments than Japan spends, which relies more heavily on rail transportation than does the U.S.

As noted by David A. Aschauer, senior economist at the Federal Reserve Bank, the net result is a decline in U.S. competitiveness. "A root cause of the decline in the competitive position of the United States in the international economy may be found in the low rate in which our country has chosen to add to its stock of highways, port facilities, airports and other facilities which aid in the production and distribution of goods and services."

As shown in Chart 1, as the U.S. investment in infrastructure has fallen, so has its productivity.

Other measures show a decline in infrastructure investment as well. Absolute dollar amounts invested in infrastructure when measured in 1972 constant dollars fell by 17 percent between 1964 and 1985. When measured on a per capita basis, spending has dropped by 40 percent since 1964. Perhaps the clearest way to demonstrate the decline in surface transportation infrastructure investment is to compare some numbers from the 1960s and 1980s. In the 1960s, 12 cents of every dollar spent on automotive transportation went toward roads. In the 1980s, only six cents of every dollar has gone toward the U.S.'s road network -- a 50 percent reduction at a time of escalating road use.



Between 1968 and 1988, the private sector invested in new plants and equipment at a much higher rate than the public sector invested in infrastructure. Private-sector spending on capital rose from just over $4 trillion in 1982 to $7.3 trillion in 1988 while non-military public capital stock increased from $1.2 trillion to $1.7 trillion. The ratio of public to private fixed capital stocks sunk from over 30 percent in 1968 to approximately 23 percent by the end of 1988.

As Mr. Aschauer noted in a March 14, 1990, Wall Street Journal editorial, "Public Spending and Private Profit":

> Countries that sustain a high level of public investment relative to output experience higher productivity growth than other countries. For example, during the past two decades Japan has invested about 5.1% of output in public works and achieved productivity growth of 3.1% per annum while the U.S. has maintained a low public investment ratio of 0.3% and seen inferior productivity growth of 0.6% per year. A part of the explanation of the decline in the competitive position of the U.S. may be found in the low rate at which it has added to its stock of ports, highway, airports and other facilities that aid in the production and distribution of goods and services.
>
> Yet physical capital investment slid from 24.3% of total federal outlays in 1960 to 11% in 1990 and is scheduled to fall to 10.7% in 1991. Similarly, total federal investment has slumped from 34.1% of outlays in 1960 to 19.4% in 1990 and, if the president's proposed budget were adopted, would decrease to 19.2% in 1991.

Twenty years of underinvestment has led to the wearing out of the basic systems necessary to support economic growth.

America's Changing Transportation Needs

The 1980s has been the decade of the suburbs in terms of economic growth. Since 1950, 86 percent of the U.S.'s population growth has taken place in the suburban areas surrounding central cities. While Americans were deciding they liked the density of suburban living, they were also choosing to live in larger metropolitan areas. By the mid-1980s, approximately half of the U.S. population lived in 35 areas with 1 million or more people, and one of three Americans lived in areas with 2.5 million or more people. (Seventy-five percent of all Americans live in metropolitan areas.)

In 1950, only 17 American metropolitan areas had populations of one million or more. These areas contained less than 30 percent of the nation's population. Jobs moved with population. Between 1960 and 1980, over 60 percent of all job growth took place in suburban areas. In 1960, American suburbs had about 14 million jobs or 35 percent of the U.S.'s employment base. By 1980, the number of jobs had more than doubled to 33 million. Today, as we enter the 1990s, businesses in the suburbs employ 60 percent of all workers and are responsible for 67 percent of all job growth.

The impact of these trends can be seen in communities around the country.

- In Gwinnett County, 18 miles outside of Atlanta, the population has grown from 72,000 in 1970 to 250,000 in 1987.
- Oakland County, near Detroit, has been responsible for 40 percent of all job growth in Michigan since 1982.
- Tysons Corner, a sprawling Washington, D.C. suburb in Fairfax County, Virginia, has more office space than either Baltimore or downtown Miami.
- This growth in the number of people and jobs in new suburban locations has doubled commuting time and has led to rush hours in the New York metropolitan area that will last for 15 hours a day by 2000.

In addition to shifts in population and job locations, there continues to be a major social change in the composition of the work force, as the Eno Transportation Foundation Report, Commuting in America, points out.

- Between 1960 and 1980, the working-age population increased by 40 million, an increase of 38 percent, compared to an overall population growth of 26 percent.
- More than twice as many people entered the working-age group between 1970 and 1980 as did in the 1950 to 1960 period. Total population is projected to

grow by another 40 million by 2010.

- In 1950, about one-third of working age women were in the labor force. By 1985, that figure had jumped to almost two-thirds. Of the 50 million new entries into the labor force since 1950, 30 million were women. Women represented only 28 percent of the labor force in 1950; today they exceed 44 percent. Furthermore, studies reveal that the trip patterns of women differ from those of men in that women tend to make more "chained" trips, involving travel, for example, to child care centers or shopping areas before and after work. The frequency of trips is also increased by the growth of part-time employment, particularly for women. Although these latter changes in the labor force may lessen recurring traffic congestion, they tend to increase traffic flows throughout the metropolitan area.
- In those metropolitan areas experiencing high rates of population growth in the 1970s, the growth in the number of workers was far in excess of population growth.
- Phoenix, the fastest-growing large metropolitan area in the nation, increased in population by 55 percent between 1970 and 1980. The worker increase was 80 percent, 25 percentage points higher.

This explosion of workers has led to an explosion in commuters, and the U.S. is more dependent than ever on the automobile. The U.S. is faced with a national gridlock problem that is threatening its quality of life and economic vitality.

Relationship to Congestion

To put the impact of these economic and demographic changes in perspective, let me note several changes that have taken place between 1967 and 1987. The number of licensed drivers is up

55 percent, motor vehicle registrations are up 95 percent, and vehicle miles traveled are up 105 percent. At the same time, total highway disbursements were up 8 percent in constant dollars. Between 1950 and 1983, there was a 100 percent increase in the number of freight miles traveled per ton, and the average haul length increased by 30 percent.

Demand for new highways, accompanying the population and employment migration to the suburbs and beyond, has not been met by an increase in new construction. While the overall number of vehicle miles traveled between 1960 and 1987 increased about 3.7 percent per year, or roughly 168 percent, the number of new highway miles increased by only 9 percent. In addition, demand for intersuburban traffic movement and a greater number of highway access points have changed the intended use of interstates through many metropolitan areas. Because highway capacity has not met growing demands, the duration and location of traffic congestion have increased, as have the number of accidents.

As noted by the National Council on Public Works Improvement, "We have worn through the cushion of excess capacity built into the earlier investments without making commensurate investments of our own." The result has been a decline in our competitive position in the world economy and our quality of life.

Consequences

The infrastructure crisis can be measured both in terms of physical decay of transportation facilities and in the social and economic impact of congestion.

Let me share with the committee some examples in both areas.

- More than 60 percent of the miles of paved highways in the U.S. need some form of surface rehabilitation. In 1988, the U.S. Department of Transportation classified 43 percent of the interstate system pavement as either fair or poor.

Operating costs are closely correlated with pavement condition. Truck costs shoot up to

6.3 cents per mile when road conditions drop from "good" to "fair". Continuing current levels of highway funding will result in further deterioration of the highway system, resulting in an estimated $1,000 increase in vehicle operating costs per household. The relationship fortunately works the other way as well. Every $1 invested in highways reduces direct operating costs by $3 to $4. Today, 35 percent of the interstate system has have outlived its design life.

- Highway congestion already is serious in many areas, and the total number of miles travelled annually by vehicles will increase by one-third over the next decade to 3 trillion.
- By 2005, traffic delays caused by inadequate roads will cost the U.S. $50 billion a year in lost wages and wasted gasoline. Continued neglect of infrastructure is also costing jobs and increasing costs. The Port Authority of New York and New Jersey estimated that the region has lost 600,000 jobs as a result of infrastructure deterioration. In Pittsburgh, U.S. Steel estimated that it pays at least $1 million a year in additional costs to detour its trucks 18 miles around a major bridge closed by the state for lack of repair.

According to various Federal Highway Administration (FHWA) studies, congestion problems are growing throughout the transportation system. FHWA found that the percentage of urban interstate miles considered to be congested grew from 31.5 to 46.7 percent in the mid-1980s. In a 1983-85 survey of 37 metropolitan areas with a population of more than 1 million, traffic delays increased more than 90 percent in rural sections, about 50 percent in suburban areas, and 20 percent in central sections.

Traffic congestion imposes direct costs upon the individual by increasing personal travel time and vehicle operating costs in terms of fuel and motor oil consumption. For example, the California Chamber of Commerce estimated that traffic delays and rough roads cost motorists $135 a year in lost time and another $97 in fuel and maintenance costs. The Texas Transportation Institute estimated the 1986 per capita cost of congestion (user cost and additional fuel cost) at $330 without the added cost of higher insurance premiums associated with more congestion-related accidents, and $400 per capita including the insurance adjustments. Indirect costs, stemming from higher accident rates associated with driving in congested traffic, added vehicle wear and tear, degradation in the quality of travel, and higher insurance premiums, are more difficult to quantify.

Various organizations in Southern California have estimated that traffic delays amount to 300,000 to 485,000 hours per day for motorists in the greater Los Angeles area. According to a transportation official for Los Angeles County, the cost of these hours of delay is valued at over $507 million per year. The Southern California Association of Governments estimated the daily cost of recurring congestion in the Los Angeles region at over $7 million, using 1984 data and 1987 prices.

The trucking industry is also affected by congestion. According to FHWA officials, the total annual cost for trucks being delayed on freeways is between $4.2 and $7.6 billion, based on estimated vehicle operating costs combined with driver time charges of between $30 and $55 per hour. Losses on urban streets, docking areas, time losses from delays at loading docks and transfer stations may go as high as $23 billion and this does not include the opportunity costs from lost sales due to products not being available.

Impact on Business Operations and Productivity

There is a saying in business that nothing starts to happen until someone makes a sale. The corollary to that statement is that no job is finished until the product is delivered.

The declining quality of our highway infrastructure is impacting all aspects of business operations and by increasing costs and imposing delays that are hindering our ability to compete in a global economy.

As shown in Table 1, all aspects of American business are using just-in-time inventory procedures to reduce inventory costs and limit the amount of capital tied up in unproductive areas. This requires a transportation system that can respond in a reliable and predictable manner. To utilize plant and equipment and use labor more efficiently, firms are also using lower production run numbers. However, this process requires more frequent deliveries of raw materials and subcomponents as well as additional shipments to customers. Increasingly, businesses of all sizes and in all sectors of the economy are investing in new information systems that provide them with fast and reliable data on the status of their operation. This new management resource cannot be translated into economic efficiencies unless we can move goods effectively.

TABLE 1

Percent of Volume Shipped Just-in-Time by Industry

Industry	1987	1990	1995
Food	25.5%	31.3%	34.4%
Chemical	10.9	20.0	29.9
Pharmaceutical	7.2	15.0	22.2
Automotive	16.9	35.8	41.9
Paper	15.8	20.0	27.5
Electronic	23.2	27.2	31.3
Clothing/Textile	29.5	41.8	49.0
Other Manufacturing	23.5	28.7	34.8
Merchandise	6.3	10.4	12.1
Total Response	19.2%	26.8%	32.1%

Source: Customer Service: A Management Perspective, Oak Brook: Council of Logistics Management, 1988.

Transportation is a significant component of the costs of all goods. On average, 20 percent of the final cost of goods is the result of transportation expenses. An inefficient transportation system increases costs throughout the economy because it has an impact on manufactured goods at all stages of the production process.

How Much Investment in Transportation Infrastructure

Various organizations are proposing different levels of federal spending for highways and various studies are being done to estimate the impact of enhanced infrastructure investments on economic growth and productivity. The U.S. Chamber supports the concept of infrastructure investment as a means to promote economic growth, improve our competitive position in a global economy and stimulate improvements in American productivity. Further, the Chamber recommends that federal highway program spending levels be made consistent with American Association of State Highway and Transportation Officials report, New Transportation Concepts for A New Century. This would mean a federal highway funding levels of $17.6 billion in FY 1992, $19.6 billion in FY 1993, 22.7 billion in FY 1994 and $25.9 billion in 1995. Further, The Chamber endorses reaching the high investment range in the 1988-2020 planning period, as shown in Chart 2. In the short term (2-3 years) we believe this level of investment can be supported by current user fee revenues and a reasonable draw-down on the existing highway trust fund surpluses and the interest income from the remaining surplus.

The Chamber's recommendation is based on the role of transportation in the economy.

Transportation is a valuable service industry, an important cost factor in other products and a significant consideration in developing a business strategy.

To be effective and efficient, the transportation sector needs the current infrastructure decay reversed. As pointed out earlier, the U.S. is annually are suffering billions of dollars in losses from the current poor state of our infrastructure. We need to build new roads and expand our existing network to reduce current congestion problems and restore levels of mobility in our economy consistent with the standards that existed in the late 1960s and early 1970s. DOT has forecasted a 436 percent increase in freeway delays by 2005 if we do not act to expand capacity. Even using a more cautious forecasting approach, GAO (The Government Accounting Office) has estimated a 300 percent increase in delays. If these forecasts are allowed to come true, increased transportation costscould erode any other gains we make in improving manufacturing productivity and reducing costs in other aspects of manufacturing.

CHART 2: Surface Transportation Annual Expenditure Requirements, 1988-2020

Transportation Area	**Investment Range (billions)** Current	Low	High
Highways, Roads & Bridges	$66.0	$80.0	$100.5
Transit	14.5	15.1	15.8
Linkage to Other Modes	N.A.	1.0	1.0
Total	80.5	96.1	117.3

As the leading management expert Peter F. Drucker has pointed out, as an organization better controls direct production costs, indirect costs such as freight charges play an expanding role in your ability to compete.

Business is increasingly recognizing that the essence of automated production is a system organized around information. To fully utilize the benefits of an information-driven manufacturing process we need a support system that is reliable, efficient and cost effective.

The U.S. is not better able to compete if we eliminate manufacturing productivity gains through escalating transportation costs. It does management no good to have better information with which to plan and control its production runs and inventory levels if it cannot rely on the transportation network to deliver raw materials and or subcomponents to his/her plant and finished products to his/her customers in a timely fashion.

A sound transportation system is a precondition for a globally competitive economy. We need to build a transportation network with sufficient capacity to support our current requirements to move people and goods, provide room for future growth and create an environment that encourages innovation. To determine the proper level of infrastructure investment, we need to balance our engineering skills and construction capacities, our social and economic needs, a healthy concern for the environment, and our ability to pay.

Chamber Position

The Chamber supports continued federal action to provide a transportation system that meets the nation's mobility needs. In shaping action in this area, it supports the following principles:

- There is an immediate need to begin to restore those portions of the basic infrastructure that have fallen into dangerous disrepair. In addition, every effort must be made to begin constructing those projects needed to provide the services required to accommodate growth. Programs to better use the existing infrastructure network should be encouraged.

- User fees should play a central role in financing infrastructure construction, rehabilitation and maintenence.

- The massive infrastructure needs of the nation will require the establishment and enforcement of priorities for repairing, rebuilding and developing the public works needed to support commerce and protect the public health and safety.

- Where appropriate, provision of public infrastructure services through private means or local authorities should be considered on a cost-effective basis. Privatization can and should play a key role in meeting public capital needs.

- Establishment of a federal infrastructure bank should be considered by Congress as a method for improving the management of federal contributions to state and local efforts. Federal user fee financed trust funds for infrastructure, such as those earmarked for highways and aviation facilities, should be taken off-budget to ensure that the monies raised through this method are spent efficiently and effectively and with a minimum of political interference. Capital budgeting should also be considered in managing federal infrastructure investments.

Next year, Congress faces one of its most important challenges in 25 years. The basic legislation covering highway and transit programs will expire. The interstate highway system, which has provided a focal point for this legislation, will be declared complete. This will provide Congress, the Administration and the business community with an opportunity to establish new directions and develop new priorities.

The key question underlying all debate in this field is whether Congress has the will to find ways to improve the nation's transportation infrastructure to meet the needs of the 21st century. Without a sound infrastructure network, the U.S. cannot have a strong economy or a high level of productivity.

U.S. HOUSE OF REPRESENTATIVES
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

"INFRASTRUCTURE AND AMERICA'S ECONOMIC FUTURE"

TESTIMONY OF:

DAVID LEWIS, Ph.D
PARTNER
HICKLING CORPORATION

AND

DANIEL HARA, M.A.
HEAD OF POLICY RESEARCH
HICKLING CORPORATION

JUNE 13, 1990

INTRODUCTION

We would like to offer a perspective on the question of public infrastructure investment in the context of its role in promoting national economic growth. Our comments are presented in the form of an overview; our colleagues on the panel, Dr. David Aschauer and Dr. Laurits Christensen, will then add further detail to certain points that we believe deserve special emphasis.

Our overview touches on four, interrelated points that help put the role of public infrastructure in perspective;

- The first is that enhanced productivity is key to long-term economic growth and improved living standards;
- Second, more capital investment is a critical factor in enhancing the rate of growth in productivity;
- Third, both private and public infrastructure are important aspects of capital investment as a source of productivity growth;
- Fourth, not all investment is good investment. Sound analysis is critically important in assessing whether infrastructure projects are likely to yield net economic gains. An important problem here is that certain kinds of productivity gains are not typically measured in the assessment of infrastructure projects, leading to possible under-investment.

Taken together, these four issues indicate that infrastructure investment has a key role to play in promoting America's economic future. More capital formation in general is crucial for productivity and living standards and public investment has a key role to play. Equally important is the quality of investment. More private capital formation will generally lead to high quality investment because market forces provide firms with an incentive to channel capital dollars productively. In the public sector, on the other hand, special efforts are needed to ensure that investment dollars are used wisely and that infrastructure programs and projects are planned in recognition of the productivity potential they can unlock for private industry.

PRODUCTIVITY AND ECONOMIC GROWTH

Enhanced productivity is key to long-term economic growth and improved living standards.

Real output, or Gross National Product, may be viewed as the number of workers in the economy times the production per worker. Future growth will come from one of these two sources -- more workers, greater productivity per worker -- or from both.

However, both labor force growth and productivity growth have been dropping relative to past levels.

Labor force growth has slowed from as high as 2.9% per year in the late 1970's to a projected level of 1.3% between 1987 and 1997, and a further reduction to 1.0% between 1998 and 2011. This slow-down reflects both lower population growth and smaller increases in labor-force participation. An aging workforce implies fewer younger workers entering the work force.

To our misfortune, growth in U.S. productivity has also declined in relation to historical patterns. Whereas total factor productivity of the United States economy had increased by an average of 1.19 percent per year between 1913 and 1950, it actually declined by about 0.27 percent per year between 1973 and 1984. If current trends continue, many forecasters foresee total productivity in the United States growing on average by about 1.5 percent over the next quarter century, reflecting about 3.5 percent growth in manufacturing productivity. The lower level of growth in overall productivity reflects, among other things, the poor measured performance of productivity in many of the service sectors.

When long-term forecasts of labor-force and productivity growth are combined, the 25-year outlook for overall economic growth is about 2.5 percent a year. According to Professor Ralf Landau, a consulting Professor of economics at Stanford University and a faculty member of Harvard's Kennedy School of Government, if the long-term rate of U.S. economic growth is not increased to its historic level of some 3.5 percent, the ever greater employment opportunities and even higher levels of material well-being to which most Americans have grown accustomed will no longer be possible.

Landau believes that the key to improved prospects for growth lies in the nation's productivity. An increase in the projected growth rate in overall productivity of 0.8 percent a year would be sufficient to bring overall economic growth to the level of about 3.5 percent over the long term. Although the amount may seem small on an annual basis, the compound effect over many years would be substantial.

Higher productivity would allow industry to increase its international competitiveness without sacrificing the wages of its workers.

CAPITAL INVESTMENT AS A CATALYST OF PRODUCTIVITY

If productivity is the key to growth, what factors are key to improved productivity?

One well known factor is the level of capital investment per worker. The more capital invested per worker, the more productive each worker can be. Consequently, the greater the rate of investment in new capital, the greater the rate of growth in productivity. Researchers have documented a strong statistical relationship between the growth rate in capital investment per worker on the one hand and the growth rate of labor productivity. Nations with high gross capital formation display high growth rates in labor productivity and vice versa. With the lowest growth rate in capital investment per worker among the nations of North America, Europe and Japan, the U.S. has also enjoyed the lowest rate of growth in labor productivity.

The rate of capital investment is important not only for its addition to the amount of capital per worker, but for its impact on the **quality** of that capital. Because new capital tends to embody the latest technology, the more rapidly new capital is added to the capital stock, the faster the average productivity will grow. The significant, though less obvious point, is that the rate of technological progress itself is dependent on the rate of capital investment. The more quickly new capital is added to the capital stock, the better the quality of that capital will be in terms of the innovative technology it embodies. This in turn means higher productivity and higher growth.

How is it that capital investment stimulates technological advance and productivity growth? According to Landau's research, the answer may be found in the way technological change is incorporated into capital equipment and facilities. Except for a small part devoted to basic science, research and development is seldom undertaken unless its results are expected to be applied in new facilities and superior operating modes that can improve productivity, reduce costs or raise the quality of goods and services. Therefore, a larger rate of investment creates a market for technological improvements, spurring technological advance and improved productivity.

THE ROLE OF PUBLIC INVESTMENT

As with private investment, the rate of public investment is important to productivity growth.

The productivity of public capital is driven by new investments. Not until 1985, when Congress authorized a multi-billion investment program for the nation's air traffic control system, did it also authorize the Federal Aviation Administration to begin in earnest a program of research and development in advanced automation. The Congressional Budget Office at that time indicated that, well managed, such a program would yield more than $36 billion in productivity improvements for airlines, business travellers and industry.

A similar example is apparent in the case of federal highway investment. It was in association with a sizeable increase in the level of federal highway spending that Congress saw fit to authorize the Strategic Highway Research Program, a multi-million dollar effort to find more productive pavements, construction methods and maintenance techniques.

New technology and approaches embodied in public capital investments unlock, in turn, the application of new technologies in the private sector. New air traffic control facilities lead to innovations in aircraft management. New road surface standards lead to innovations in truck design.

More generally, there is emerging statistical evidence of the influence of public capital investment on the nation's overall rate of growth in productivity. We mentioned earlier that researchers have documented statistically a complementary relationship between gross capital investment and the rate of productivity growth. Other researchers, such as Dr. David Aschauer of the Chicago Federal Reserve Board, are trying to disentangle the relative influence of private and public investment and coming up with interesting results. The findings indicate that both private and public capital investment contribute to productivity growth. There is also some statistical indication that the returns to public capital investment presently exceed private returns. But this debate partly misses the point that both private and public investment can create the economic conditions for more productivity and thus the enhanced economic growth needed to sustain living standards.

THE IMPORTANCE OF PROJECT ANALYSIS

While the rate of investment in public capital is crucial, we must also be discriminating on where that investment is made. Not all investment is good investment.

In the private sector, the profit motive, combined with competitive forces, tend to ensure that the right kind of investment takes place. In the public sector, it is necessary to find a way to test and ensure that the right kind of investments are being made.

Traditionally, the practice of benefit/cost analysis is supposed to answer this need. Projects which pass benefit/cost tests are supposed to be the most worthwhile.

In principal, benefit/cost does provide the correct answers and guidelines. However, research-in-progress by Hickling and Christensen is asking whether benefit/cost analysis, as **currently practiced**, measures the full productive potential of infrastructure projects. The evidence thus far is that, under certain circumstances, it does not. The theoretical foundations of this finding are now being completed.

In essence, the problem is one of anticipating the impact of public sector investment on private sector productivity. For example, typical benefit/cost assessments of road improvements will measure benefits by assuming that the current overall structure of the road network is the most productive, and that the current types of vehicles travelling on the road will be unaffected. Benefits will be measured using time and fuel savings and to existing traffic. If new road surface standards permit the design of a better truck, the benefits of this to the private sector will be missed. If the development of satellite navigation and dispatching of trucks requires a redesign of the basic road network, this too could be missed with current benefit/cost techniques.

In short, the current practice of benefit/cost is based on an assumption of the acceptability of the status quo. Allowance for the constraints this places on the application of new technologies by the private sector is often neglected.

Industry itself is beginning to recognize the same point. Writing in a recent issue of the Journal of Transport Economics and Policy, a logistics executive (and former specialist in public investment planning and analysis) of a major supermarket chain writes that;

> "It is doubtful whether current methods of Cost-Benefit assessment fully account for the benefits of network improvements, which may include structural changes in distribution logistics"

Dr. David Quarmby, the author of this quotation, cites the case of highway network improvements leading the firm to reduce the number of food distribution depots needed to service a given territory of retail outlets. The benefits arising from this restructuring arise from the economies of fewer depots providing the same level of service and an inventory saving through a reduction in the number of stocking points. Quarmby goes on to show that benefits to commercial vehicles of road improvements, calculated as in the conventional way (as straight time savings) will tend to underestimate the true "business potential" unlocked by such improvements. In the retail distribution of food, for example, it is shown that conventional Cost-Benefit analysis of network improvements could understate the true benefits by 30-50 percent if some form of restructuring takes place.

Quarmby also notes that the move away from own-account to contract distribution creates a more responsive "market" for distribution services, and this enables distribution networks to react and adjust more readily as changes in the road network come along.

Clearly, it is important that the business and productivity potential released by infrastructure improvements be clearly understood and incorporated in our assessment of public investment opportunities. Failure to do so translates directly into a risk of sharp under-investment and mis-investment, with consequent sacrifices in economic growth and improved living standards.

The question is, how can this potential be exposed? To be sure, more in-depth surveys and studies are needed. Additionally, however, we see the need for a great deal more interaction between federal and state government officials -- the people who plan the infrastructure -- and industry itself, the people who use it.

Infrastructure planners and decision-makers need to seek out the David Quarmby's -- the logistics managers and the investment planners, industry by industry. We need to find out directly how different kinds of transportation facilities will affect the way they do business. New forms of cooperation and information-sharing between the public and private sectors are needed in order to alert those who plan the infrastructure to the radical changes occurring in U.S. industry as it grapples with the need to cut inventories, speed the flow of products, and speed product development. All these considerations underpin our ability to compete globally, and to increase our standard of living.

CONCLUSION

Productivity growth is the key to economic growth, competitiveness, and a rising standard of living. U.S. productivity growth has fallen below historical norms, and below our international competitors. A vigourous new look at public infrastructure investment offers a way to move productivity growth back up to its accustomed levels.

In setting total levels of investment in public infrastructure, we need to be aware of the extra impact of the rate of investment on the quality of capital. Higher rates of investment stimulate innovations which improve the productivity and effectiveness of the new capital.

In approving projects, we need be aware of the impact that public investment has on private sector productivity. New forms of cooperation and information sharing are necessary to identify and account for the private sector technologies and logistics enabled by public infrastructure investment. This will lead to not only a greater revealed need for investment, but also more productive investment.

More capital investment is needed -- both private and public -- in order to give labor and firms more productive leverage over their output. In the case of public investment, special efforts are needed to ensure that decision-makers understand the private business potential that certain kinds of infrastructure projects can unlock. Without this understanding, continued under-investment is inevitable.

Dr. David Lewis earned his Ph.D from the London School of Economics and was formerly a Principal with the Congressional Budget Office. Daniel Hara is Head of Policy Research for Hickling Corporation and an economist specializing in industrial organization, regulatory economics and investment planning. This testimony is based in part on Lewis & Hara, "The Role of Public Infrastructure in the 21st Century", A Look Ahead: Year 2020, Transportation Research Board, 1988.

"STRENGTHENING AMERICA'S FOUNDATION FOR COMPETITIVENESS"—TESTIMONY BY MARVIN RUNYON, CHAIRMAN, TENNESSEE VALLEY AUTHORITY

On behalf of our Board and the employees of the Tennessee Valley Authority, I'm honored to appear before you today. I believe that the members of this Committee have shown great foresight in focusing this hearing on a subject that's so essential, yet so often taken for granted.

"Infrastructure" doesn't have the glamour associated with high-tech, and it doesn't have the luxury of a high profile, but it's highly important to this Nation's future. That's because we're really talking about investments in the basic facilities and services needed to keep this country going—investments in America's foundation for competitiveness in a changing world.

We appreciate this opportunity to tell the members of this Committee what we're doing to contribute to this framework for the future as we make TVA an even more productive asset for the Tennessee Valley region and our Nation. I know that some members of this Committee are already very familiar with TVA, especially Congressman Clement, Congressman Duncan, and Congressman Ballenger. Their Districts are a part of TVA's 80,000-square-mile service area, and we're grateful for their counsel as members of the Valley Delegation, as well as their contributions as members of this distinguished Committee.

We also appreciate the encouragement that members of the Committee have shown for TVA's new way of doing business and the results we're achieving. Through a combination of teamwork, increased communication, and participation by all our employees, we've become a more businesslike organization. And we're accomplishing goals, such as our three-year freeze on electric rates, that just a couple of years ago many people thought were impossible.

Today, we're here to focus on TVA's role in strengthening our national framework for delivering essential services.

As I mentioned, every reference that we make to infrastructure is really a reference to investments in the common good. We're talking about investments that enable economic growth to take place and stimulate other improvements in the quality of life.

When TVA was established by an Act of Congress in 1933, this unique public corporation was given the charge to work with the people of the region to bring about a wide range of improvements in the quality of life in the Tennessee Valley. To accomplish that mission, TVA built a foundation for regional development. That framework included multi-purpose dams that controlled floods and improved navigation along the Tennessee River and its tributaries. Those dams also brought electric power to the entire region, including vast rural areas in which only three farms in 100 had electricity. TVA demonstrated that selling power in new markets could actually lower the unit costs of electricity to consumers.

To meet the region's growing power demands, TVA was one of the first electric power suppliers to experiment with large turbine generators in steam plants. Our high-voltage transmission system was another "first" in the industry. These and other advanced engineering technologies pioneered by TVA now benefit every power consumer in the United States.

TVA became a national laboratory for developing new ideas and new ways to improve the quality of life through partnerships with State and local governments, the private sector, and educational institutions across the region. TVA's power system today serves more than seven million homes, businesses, and industries in parts of seven States; and that system is connected by a 17,000-mile network of transmission lines. The original investment in TVA's power system came from Congressional appropriations. But since 1959, on the recommendation of this Committee, our power system, has been self-financing. And in our annual payments to the Treasury, TVA is paying back, with interest, the original public investment in our power system.

Today, TVA operates 39 dams on the Tennessee River and its tributaries, the Nation's fifth largest river system. This series of dams and locks makes commercial navigation possible for the 650-mile length of the river from Knoxville, Tennessee, to Paducah, Kentucky. It's a vital link in the inland waterway system that provides access to ports in 21 States from the Great Lakes to the Gulf of Mexico.

In addition to being the most energy-efficient form of moving goods, waterway transportation also helps hold down maintenance costs for other parts of the Nation's infrastructure. After all, a single barge has a carrying capacity that's equal to 15 railroad cars or more than 60 tractor-trailer trucks. Since TVA first provided a commercially usuable channel for river traffic, transportation savings to shippers are estimated to have totaled more than $2.5 billion. And private investment in waterfront plants, terminals, and distribution facilities has added up to more than $5.8 billion.

For our river system to continue to contribute to economic development, locks at the dams must be able to handle greater demands. However, river traffic is being hampered by small locks on three upstream dams. Those locks were built in the 1930s and '40s, when towing equipment and loads were much smaller.

We realize the need to make our river system more competitive by modernizing and tapping the full potential of this important resource. Overall, the framework that TVA built for electric power, navigation, and agricultural productivity has helped our region and the Nation grow and prosper.

The Tennessee Valley also is now one of our Nation's major manufacturing areas. More than 30 percent of the region's gross product comes from manufacturing, compared to 22 percent nationwide. Competitively priced TVA power is just as essential to those industries as the jobs that they provide are crucial to the communities of our region. And we know that many manufacturers and farmers depend on our river system to ship their products at a competitive cost. That's why we're making sure that these investments continue to generate benefits for the Valley region and the Nation.

And as I've mentioned, the returns aren't limited to those from bricks-and-mortar projects. About 75 percent of the modern products and processes used to increase soil fertility are based on technology developed by TVA researchers. And today, TVA's National Fertilizer & Environmental Research Center is meeting an even wider range of responsibilities.

I mention these contributions, Mr. Chairman, because they're directly attributable to the wise investment of Federal dollars to build a framework for economic development.

In determining how we can continue to maximize the return on this investment, we don't have to look beyond the horizon. The challenges presented by an increasingly competitive global economy are in full view. Our course is clear. We have to make and keep TVA competitive as a utility and as a Government agency. We must make sure that our self-financing power system supplies electricity at the most competitive rates possible. And we must manage our Resource Development programs effectively, so that they continue to merit the support of this Committee and your congressional colleagues. Maximizing the return on these investments is essential, so our region and this Nation can stay competitive.

With the support of Congress and our customers, we've held TVA power rates stable for the past two years. We fully expect to keep rates steady for 1991, and we're optimistic about extending rate stability beyond our original three-year goal. To make TVA's rate stability possible, we've achieved cumulative savings of more than $900 million. We've reduced staffing by 11,000 employees, about a third of TVA's total workforce, with no adverse impact on service to our customers. We've also reduced overhead costs by about 30 percent in our Resource Development programs, making more funds available to improve services to the people of the region.

These cost-savings and productivity improvements have reduced TVA's operating expenses to the lowest level since 1986. And while we reduced operating costs, we increased power sales last year by 2 percent. That may not sound like a lot—but in the context of a power system the size of TVA's, it amounts to almost 2 billion kilowatthours. That's enough power to serve 135,000 homes.

By holding down the cost of power and making our services more effective, TVA is helping to make the region we serve and our Nation more competitive.

TVA's central challenge for the 1990's and beyond is to be the most competitive electric utility in North America in terms of costs, quality, and delivery and to be the most efficient and productive agency in Federal service. We realize that we have much more to do to keep TVA competitive. But we also hope that the lessons we've learned about increasing productivity will prove useful to others in the public and private sectors.

In our push for more efficiency and productivity, no savings has been dismissed as too small, even in the context of a $5-billion budget. Senator Everett Dirksen once said in reference to the Federal budget that, "a million here and a million there and pretty soon you're talking about real money." You could say that we applied Senator Dirksen's approach in a new context—save a million here and a million there and pretty soon you're achieving some real savings. In many cases it wasn't a million or even close to that amount. For instance, our Resource Development group identified a savings of $6,000 by reducing computer time and other costs associated with producing their monthly ledger sheets.

On the other end of the spectrum, we renegotiated our coal contracts to take advantage of market conditions and saved nearly $30 million in annual fuel costs. And our initiatives to refinance TVA's high-interest debt are saving TVA power customers nearly $150 million a year.

We've recruited a number of top-level managers from the private sector and gained an infusion of new ideas to help renew TVA's spirit of innovation.

In TVA's Nuclear Power program, for example, we've reduced contract manager costs from more than $17 million in 1986 to zero this year. In other words, we have no contractors serving as line managers at TVA today. We've replaced them with a strong management team of TVA personnel. Our power customers have enjoyed the benefits of this new era of professionalism through record-setting performance. Last year, both units of our Sequoyah Nuclear Plant near Chattanooga set continuous run records. And Unit 1 at Sequoyah ranked second in the United States and eighth in the world in terms of generation.

As an organization, TVA is stronger and strategically better prepared to become a more competitive asset for the Valley and our Nation. We've set an agenda for the 1990s, concentrating on five strategic areas. We're focusing on providing environmental leadership, stimulating economic growth, serving our customers through a customer-first philosphy, maintaining a quality workforce and workplace, and achieving excellence in nuclear power operations. With your permission, Mr. Chairman, I will submit for the record a copy of more detailed information that I provided to all TVA employees and retirees about each of these strategic areas.

These initiatives are in keeping with the intention of TVA's founders to combine the authority of the Federal government and the flexibility and initiative of a private enterprise.

I believe that the same kind of disciplined and businesslike approach can be applied across the spectrum to strengthen America's foundation for competitiveness. Whether we're talking about operating airports or building and maintaining bridges, highways, or waterways, taking a competitive and businesslike approach can make these public investments more valuable assets.

Before I close, Mr. Chairman, I want to urge the consideration of two additional elements as part of the infrastructure for America's future. They may not be familiar in that context, but they also require substantial public commitments, and they also will serve as building blocks for a better future. These additions to America's infrastructure of the future represent investments in improving the quality of education and the quality of the environment.

Our education system must do a better job of teaching the basics of reading and writing and mathematics. But our young people need more than just the basics. Education must be competitive advantage for them and for this country in the years ahead. TVA is working with the region's colleges and schools to establish a number of skills training programs. And we're exploring ways that new technology, such as the fiber optic network we're installing for our power system, could have additional applications in support of education.

The need for a quality environment is receiving increasing attention today, and it also will require major investments by the public and private sectors.

TVA's commitment to environment leadership already is paying dividends for the region and the Nation. We have demonstration projects under way to help solve a wide range of air, water, land, and waste-management problems. All of our Nation's resource must be managed wisely if we are to sustain growth and attain the quality of life that we all want to enjoy. So both quality education and a quality environment have to be considered as essential parts of America's foundation for competitiveness.

In closing, Mr. Chairman, I hope that it's evident from the changes we're making that we want to make sure TVA remains a good investment for the American people. We appreciate your continuing support as we take TVA into a new era of quality and productivity.

(Attachment submitted for the record: "Mapping out TVA's agenda for the 1990s," a column by Chairman Marvin Runyon on five strategic areas that will shape TVA's future. The column appeared in the April 24, 1990, issue of Inside TVA, a publication for all TVA employees and retirees.)

TO EXAMINE THE FUTURE OF OUR NATION'S INFRASTRUCTURE NEEDS

MONDAY, JULY 16, 1990

House of Representatives,
Committee on Public Works and Transportation,
St. Clairsville, OH.

The Committee met, pursuant to call, at 9:05 a.m. at the Days Inn, 52601 Holiday Drive, St. Clairsville, Ohio, Hon. Glenn M. Anderson (chairman of the committee) presiding.

Present: Representatives Anderson, Applegate and Mollohan.

The Chairman. The meeting will come to order.

Good morning. The Committee on Public Works and Transportation hearing on the future of our Nation's infrastructure needs will come to order. I want to welcome you here today and thank you for taking time from your busy schedules to share with us your concerns, knowledge and perspectives about this important issue.

This year, our Committee initiated a series of events designed to give us a better understanding about our Nation's infrastructure crisis. At our first event in Washington, we looked at emerging infrastructure needs from a national point of view. Our second and third events focused on the impact of infrastructure on the productivity, growth and ability of our country to compete in international markets. Future events will include hearings on infrastructure financing alternatives and new technologies.

It is very important, however, for us to get a good look at the infrastructure problems encountered at the local and state levels. Our meetings today, here in St. Clairsville and this afternoon in Youngstown, are the first of several planned at various sites around the Nation. We want to review infrastructure needs with the people most directly involved and to hear a broad range of ideas that can help resolve the problems.

It is a great pleasure for me to join Doug Applegate for this hearing and I want to thank him and the people of the 18th District for their generous hospitality. I consider Doug to be one of the Congress' hardest working members. He has spent many long hours working for veterans' benefits in his position as the Chairman of the Subcommittee on Compensation of the Veterans Affairs Committee. At the same time, he has been a knowledgeable and effective member of the Committee, serving on the Subcommittees on Economic Development, Surface Transportation and Water Resources. And Doug's long-standing concern for the welfare of the people of this area, and his efforts to overcome the social and economic problems that have resulted from the declining coal and steel industries, are well known and admired.

He has long been an advocate and industrial supporter of programs that benefit the economies of this region and the whole Nation, and in fact recently took the lead in passing legislation to include Columbiana County within the Appalachian Regional Commission.

Doug knows that when we talk about infrastructure, we are talking about the very cornerstone of our cities and rural communities. Though it may not be an exciting subject, it is infrastructure that provides the foundation for a sound economy and is at the very heart of the standard of living and quality of life that Americans enjoy.

From the hearings thus far, we know that not only do many problems exist with our public works facilities, but we have been short-changing our public works investments for more than 20 years. The question we ask today is: What about Ohio's infrastructure? How adequate is its network of public facilities—the roads, the bridges, public buildings, prisons, sewers and wastewater treatment facilities, water supply facilities, dams and other public works—to meet current needs?

In addressing this, we should all keep in mind that economic research in recent years has tied the level of public spending on infrastructure to the productivity growth rate in the private sector. The U.S. productivity growth rate fell from 1.8 percent annually in the 1960s to seven-tenths of a percent in the early 1980s. And during the same period, the annual growth rate of investment in infrastructure fell from 4.5 percent to .8 percent.

Productivity in our country is growing much more slowly than in other developing countries such as Japan, West Germany, Canada, France, Italy and the United Kingdom, some of which incidentally invest almost twice as much in their public works as does the United States. Actually I saw one figure, just last year Japan spent five times as much in infrastructure as did the United States, which kind of shocked me because you can look on a map—I come from California, you can lose the whole country of Japan on the map in California, and when you think that that country spent five times as much on infrastructure—highways and things—as the whole United States did, it is shocking.

Today, we look to you to help us gain further insight into our infrastructure needs and your infrastructure needs. What is the condition of and how adequate is your infrastructure to meet current and anticipated needs of the area?

Who do you think should pay for the necessary public works and what financing techniques have you considered? What do you think the federal role should be? The state role? The local role? Lastly, what should our Committee be doing to resolve some of these problems?

As we continue our inquiry and debate on how to deal with the current and anticipated needs of our public works, we look forward to your answers and to questions that you may raise.

Doug, would you like to make an opening statement?

Mr. Applegate. I get all choked up when this happens.

Glenn, thank you very much—I suppose I should be a little bit more formal and say Mr. Chairman——

I have known Glenn for the 14 years that I have served in the Congress of the United States and while he comes from California, he has been a very effective member for the entire country, having served as Chairman of the Surface Transportation Committee and others, and now has come to fruition with the Chairmanship of the Public Works Committee.

And I want to thank him and Paul Schlesinger and the rest of the staff who is with us all today, including Anne Grady and Jim Hart on my own staff, for bringing this Committee into the 18th Congressional District, because I think it is very, very important that we have this kind of input.

Obviously there is a tremendous need for the Public Works Committee to be able to come in and listen to some of the problems that we are having, because the only way that we are going to be able to succeed is in the development of our economy. We cannot do it if we do not have some kind of assistance. It comes into prominency when we look here in the last month or so where we have had a couple of very serious floods affecting the Shadyside, Ohio area and the Dillonvale, the Adena, Newtown, Dunglen areas. These have been ravaged to the degree that they have really affected the ability of the local communities, these communities, to be able to make industries even look at them.

One of the problems of the flash flooding was the lack of infrastructure in these areas. We do not have the proper sewer facilities and I think that it shows that eastern Ohio is somewhat far behind in that respect. So we need this kind of input from our local officials to tell us why it is we need what we need, where we need it and what we need.

We are continuing to lose our population, we are going downhill in that respect. Ohio stands to lose two Congressional Districts and Glenn, in all due respect, you in California, you are going to pick up some of our losses. So they are going to the sunshine states, California and Texas and Florida and those places.

But we cannot continue to keep on losing, because we are losing our tax base and other things. But we need the roads, the sewers, the water facilities, the new bridges and all that the Chairman has talked about.

And you know, when business comes into the area, they look at education, the quality of education. They look at the tax base, they look at the attitudes of the people. We can fulfill all of that very adequately, but they also look at the infrastructure system and if it is not in place, they are going to go somewhere where it is because they know that there is a place out there that can work advantageously to their profitability and that is where they are going to go.

Just two areas and I will mention it for the record and I am sure somebody will be looking and wanting to talk about it. We have, of course, Mr. Chairman—the Governor of Ohio has come forth and through the Director of Highways who is a witness today and will be testifying, has come forth and they have announced that they were going to complete some roadways—the bypass at Bellaire, the connector in East Liverpool if they ever get around to agreeing on anything up there, and Route 39 and different ones like that.

So we can deal with fewer basic problems as far as highways are concerned, but two of those would be the relocation of Route 250, which would run from Harrison County, which has the—either the first or the second highest unemployment rate in the State of Ohio, along with Monroe County. And it would open up a westward outlet for them so that they could go to the west and towards Columbus and that area. There will be an eastern, which would open them up to the eastern markets and into Pittsburgh. So that will be very good, but they are land-locked and they need these kind of infrastructure improvements to invite new industries into that area. And also, which I am sure that John Laslo may be talking about, is the Short Creek roadway from the Cadiz or Harrison County area down to the river, to open up that flooded area's potential for bringing in new industry.

And let me just say one thing and I will turn the mike over and let somebody else say something. Recently in Monroe County, we were able to be successful in getting approval for a grant for $2.5 million financed by the state for water lines which we will develop new well fields, new lines which would help retain the Ormet Corporation down in Monroe County and open up some new avenues for economic development which has been very good.

But here is what we are facing next week, and I think it is very important, and I throw this out to you as sort of a sidelight. We are going to be looking at a Constitutional balanced budget amendment. If this balanced budget amendment is passed, and it is being pushed by a group of members in the House of Representatives, who have taken a blood oath that there will be no new revenues, that is going to be coming down the line, that the only thing they want is a balanced budget amendment, which means that you have to cut spending in order to achieve it. That is where they are coming from.

Now if we have to go down the line and pick up all the spending that we have to pick up to save money, where are we going to get it? We are going to eliminate FEMA, we are going to eliminate EDA, we are going to eliminate the SBA, we are going to eliminate EDA—I said that—the ARC. We are going to eliminate all the lettered programs that are pushing monies back into our area, where we have a potential. We are going to be losing because the Department of Transportation is going to be seriously cut back. Every program will be slashed and we might as well just turn out the light and leave a note for the next person who wants to come in and try to start it up again. That is exactly where we are, and it is a little bit frightening because I think those people have shown a strong irresponsibility in while they are pushing for a balanced budget amendment, they are not saying how they are going to do it.

That is what I wanted to say. So thank you, Mr. Chairman, for allowing me a few minutes and I am anxious to hear what our guests have to say today.

The CHAIRMAN. Well thank you, Doug.

I want to congratulate all of you on selecting Doug Applegate. He is one of our best—and on top of that we like him, he is a good guy too.

I want to call on our first witness this morning, the Honorable Bernard Hurst, Director of the Ohio Department of Transportation.

I want to welcome you, Mr. Hurst. We look forward to your testimony. I am going to say something a little bit later when we have some of the others in, because we are going to have a fairly large group of witnesses today and I am going to ask them to summarize their statements in a two or three minute presentation, but so they do not worry, you may be sure that your full written statement will be printed in its entirety in the record of this hearing.

I am not trying to limit you, Mr. Hurst, because you are the state chairman here—state director, I guess I should say—probably the same thing.

TESTIMONY OF HON. BERNARD B. HURST, DIRECTOR, OHIO DEPARTMENT OF TRANSPORTATION (ODOT)

Mr. HURST. Mr. Chairman, welcome to Ohio. We, in the transportation field, are indeed honored and fortunate to have you visit Ohio to hear our problems and our needs. Those of us involved in transportation on a national level are well aware of your vast knowledge and your genuine concern for transportation problems. You command a very high degree of respect from all transportation officials throughout the country. We in Ohio are also most fortunate that you have serving on your committee three distinguished members from Ohio—Congressmen Applegate, Trafficant and McEwen. My office communicates almost daily with Congressman Applegate, and his presence on this Committee present ODOT with an excellent opportunity to transmit and receive information relative to transportation issues.

Because of my limited time, I am presenting a more detailed written testimony for the Committee's record. However, I will give a brief oral summary now of that written testimony.

Mr. Chairman, I know how you stand on many of the transportation issues we are facing today, and being substantially in full agreement with you, it is not necessary for me to attempt to influence many of your decisions.

I do want to make you aware of the problems in Ohio that we are administering and the additional programs we need to initiate in order to adequately address our future transportation needs.

Our funding for an adequate preservation program of our existing highway infrastructure falls short by approximately $200 million annually.

With 112,000 total miles of public roads in Ohio, ODOT is directly responsible for 19,000 miles. Our goal each year is to resurface or rehabilitate 10 percent of our system, or 1,900 miles. However, we continually fall 300 miles short of our goal each year.

And with approximately 43,000 bridges on the state and local system, more than 8,000, or 20 percent, are structurally deficient or functionally obsolete and should be replaced or rehabilitated. Due to the insufficient funding, the numbers that need replaced or rehabilitated grow each year. The local bridges maintained by counties and cities, approximately 28,000, are in even worse shape than those maintained by ODOT, which is 15,000, so local governments have an even more severe funding problem than does ODOT.

Only through recent increases in our state gasoline tax has Ohio been able to slow down the rate of deterioration of our system and also to provide funds for some much needed improvements—new routes and major reconstruction of some existing routes.

An increase in our state gasoline tax enacted by our General Assembly on June 30, 1989, raised Ohio's gas tax by 5.2 cents in a two-step increase, the final step being June 30, 1990, which increased our state tax to 20 cents per gallon.

Under the terms of this increase, the first one penny was allocated to local governments for bridges and road improvements. The balance of the increase, 4.2 cents, was distributed in accordance with our traditional formula, 75 percent state and 25 percent local governments. The Ohio legislature saw fit to allocate the state's share of this increase to new construction or major reconstruction projects. That would amount to $180 million per year. Consequently, some very important projects that have been shelved for many years will now be funded and constructed. Locally the Belmont State Route 7 improvement in Bellaire that Congressman Applegate mentioned earlier.

To help our problems of funding, Ohio has recently joined with developers to allow private funding on two interstate interchanges, whereby the developers funded the cost of the interchange and the state provided state and federal funds to improve the main line of the interstate. This arrangement allows the developer who owns the land around the interchange to properly develop with improved highway facilities, thus making the area more attractive for potential businesses. More of this type arrangements in private financing is needed in order to properly develop areas without building in congestion.

Mr. Chairman, Ohio presently has $365 million in federal gasoline tax funds that was paid by Ohio motorists, sent to Washington for distribution back to Ohio, has been allocated back to Ohio, but is still being held in Washington due to the obligation ceilings imposed on federal spending. And I am aware that you oppose this tactic of covering up the actual federal deficit, and I know that you propose to have this money released in the 1991 Highway Reauthorization Act. I join all my colleagues throughout the country in requesting you to stand firm in this proposed action. Many needed improvements have been unnecessarily deferred, many miles of highways have unnecessarily deteriorated because of this holding action of the U.S. government.

Ohio strongly feels that, being a donor state, we should receive more than the present 85 percent minimum allocation when the new highway act is finally approved. Being a central state with many primary routes intersecting and traversing through Ohio, we will require substantial federal funding in order to build this proposed highway system of national significance.

For that reason, we strongly fee that we should have not less than 90 percent of our federal gasoline tax returned to Ohio.

Mr. Chairman, Ohio recognizes and accepts the fact that the only resolution of our future transportation problems is to have a well-balanced program utilizing all the transportation modes to their fullest extent. For that reason, we are embarked on a program to promote more rail movements of goods and people. Our rail system in Ohio is only using 25 percent of its capacity. We are attempting to purchase all lines abandoned by the major railroads and helping to create and finance short-line operators to continue shipment on these lines. We are also exploring a high-speed rail facility between Cincinnati and Cleveland.

We are expending general revenue funds to assist in the planning and in the improvements of port facilities to encourage more waterway shipment of goods. Two-thirds of Ohio's boundary, or 700 miles, has navigable water that should be more fully utilized.

We aid local governments and public transit companies in providing public transportation for the needy, for the elderly and for the people with disabilities, all directed toward the decrease in automobile traffic in our efforts to decrease congestion.

The most neglected funding category for transportation is in the research area. I serve as Chairman of the ASHTO Research Advisory Committee, I serve as Vice Chairman of the Standing Committee on Research, and I am aware in our meetings throughout this country of this shortage. Spending today for highway research is approximately two-tenths of a percent of our total highway expenditure. While successful private corporations allocate approximately six percent of their total budget to research and development, funds for highway research has steadily declined over the past several years. The need exists for us to provide better materials, better design, better construction techniques—all made possible through adequate research and development programs.

And there is a pressing need to combine the research for highways with all other modes in order to learn how to best connect the different modes in promoting a balanced transportation system. Problems exist today in combining research funds from the various U.S. DOT administrations. Intermodal connections between the various modes will present major problems that should be addressed now by proper research.

While we all agree that highways and all other transportation systems need to be designed, constructed and maintained to provide safe facilities for the travelers, we have learned that even the safest of facilities will not protect the errant or inattentive driver. We spend billions of dollars each year building and incorporating safety features into our highway systems, yet accidents and deaths continue on these safest of highways. There needs to be a better program aimed at improving these errant and inattentive drivers by an educational process that will improve their awareness and will help eliminate their physical and mental deficiencies caused by substance abuse, tiredness and inattentiveness. I feel a substantial investment in this type of an educational program will actually save more lives than our highway safety improvement investments.

Thank you, Mr. Chairman, for sharing your valuable time with the citizens of Ohio.

The CHAIRMAN. Well thank you, Mr. Hurst, for sharing your valuable time with us. That was an excellent statement. I have a couple of questions.

What steps has the State of Ohio taken or proposed to take to assist the local governments in their critical road and bridge needs?

Mr. HURST. The Ohio legislature has passed permissive legislation allowing the local governments to add a $5.00 piggyback tax on their license. They receive that money which they can spend on the local system.

The Ohio Department of Transportation, just two years ago, decided to share our minimum allocation, $25 million or approximately 30 percent, the minimum allocation that we receive from being a donor state—we share that with the metropolitan planning organizations, the cities, so that they can have more improvements on the federal aid urban systems, and we share our BR bridge funds with local governments and cities and counties to the extent that we can. We assist them in preparing their plans, planning their projects to meet all of the regulations of the Federal Highway Administration. We lend a helping hand when we can.

We just need more federal funds coming in, particularly in the bridge program. The bridges are more critical on the county level than anything else.

The **Chairman**. It seems to me Doug was telling me that.

What specifically is Ohio doing or should Ohio be doing to help solve their transportation problems in the future?

Mr. **Hurst**. Mr. Chairman, Ohio is attempting to promote more movement of goods and people on the other modes of transportation besides highways. That is why we are involved in strong programs to increase the movement of goods and people on rail, including, as I mentioned in my testimony, exploring the high-speed rail line from Cincinnati to Cleveland, and we do more in this area—we are promoting the port facilities here in Ohio. We have ports here that inter-connect all over the world, plus we have the 700 miles of waterway around the perimeter of Ohio that we should be using more for the shipment of goods.

We are involved in the privatization of highway projects now, private funding. We think that that is instrumental in the future in providing areas to develop, but provide the necessary transportation facilities before the area is over-crowded and congested.

Those are some of the things that we're involved in.

The **Chairman**. Doug, do you have any questions you would like to ask?

Mr. **Applegate**. Thank you, Director Hurst, for the very excellent testimony. It certainly will be very useful in providing us with the information that we need when we get down to making some final decisions that we hope we are going to do in the Highway Reauthorization Act next year, which will be the big year.

Two things that you stated and one that I think is very important, is that you are recommending that the minimum allocation be raised. We were instrumental in increasing that to 85 percent before, and I agree—as a matter of fact in testimony I stated in Surface Transportation, that I would sponsor an amendment to the Highway Reauthorization Bill to increase that to at least 90 percent and perhaps maybe even more.

We are a donor state, we have certainly paid our fair share. Unfortunately we are still a donor state. We ought not to be because we have been losing our population and while at one time we were one of the wealthiest states and we always helped those in need, which is supposed to be the philosophy of our nation that the wealthy states give to the less wealthy, we cannot do that any more being on the other end, so I agree that we should do that.

The other that you mentioned, you had suggested that the Chairman was very supportive of, and which he has been, he has been very diligent in this, but it is very difficult to work with some of the other leaders in the Congress to get this done, and that is to take the Highway Trust Fund off budget. I think it is ludicrous to think that it should be on budget, but the reason that it is, is because it helps to reduce the deficit that we show. There is some $18 billion in the Highway Trust Fund that needs to be spent, needs to go back to the areas such as ours in order to help us meet the needs that we are—we have been shorted on, let us put it that way. And I think that if we take that off budget, we will have easier access to making that money available to the very people who have paid it in the first place. So I think it is a very good suggestion, we are certainly going to try with the Chairman's leadership again next year, we are going to try. We have gone through a lot of very powerful people throughout the years in Congress in trying to get that done, and it meets with tremendous opposition, and particularly from the White House, for obvious reasons.

So I commend you.

Mr. HURST. That is one of the strong recommendations, as you know, that ASHTO is making to Congress in the Reauthorization Act.

The CHAIRMAN. One of our toughest ones. They cannot spend it for anything except highways, but if they do not spend it and it sits there, on paper it makes the deficit look less, even though by law it can only be spent for highways. And it is kind of foolish to have that money sitting there and not being spent—I could say pretty easily almost every state in the Nation needs a certain amount of that money. It should be spent, it will help our country and help our state. But they will not spend it and they know that just adding that to the deficit makes the deficit look less, but it really does not.

Mr. HURST. It is costly to us because it is allowing these interstates, for instance, to further deteriorate because we cannot get out and maintain them properly with that money. That is what concerns us more than anything else, the longer we let these pavements deteriorate before we can rehabilitate them, the higher the cost is. It goes up at a very high proportionate rate, the years versus the cost to rehabilitate.

Mr. APPLEGATE. I would add that of course the so-called—I think we have about $18 billion, as you know—would infuse in fact perhaps as much as $50–$60 billion back in if we were able to release that and use it. So it just does not sit at $18 billion, we are talking about a great deal more money.

The CHAIRMAN. Thank you, Mr. Hurst, for your presentation.

Next we have a panel of state legislators. They include the Honorable Jack Cera, State Representative from the 99th House District; the Honorable Joe Secrest, State Representative from the 95th House District; the Honorable Jerry Krupinski, State Representative from the 98th House District and the Honorable Rob Burch, State Senator from the 30th Senatorial District.

If you will—in whichever order you want to do it, the way I introduced you, the way you are listed, or you own way. If you will briefly summarize your remarks, then we will question you as a group.

[The prepared statement of Mr. Hurst appears on p. 497.]

TESTIMONY OF HON. JACK CERA, STATE REPRESENTATIVE, 99TH HOUSE DISTRICT; HON. JOE SECREST, STATE REPRESENTATIVE, 95TH HOUSE DISTRICT; HON. JERRY KRUPINSKI, STATE REPRESENTATIVE, 98TH HOUSE DISTRICT; AND HON. ROB BURCH, STATE SENATOR, 30TH SENATORIAL DISTRICT

Mr. CERA. I guess I will go first since this is my home.

Thank you, Mr. Chairman, Congressman Applegate, for coming—welcome to Belmont County and thank you for bringing your California sunshine for a day because we sure could use it around here. I would just briefly like to discuss the infrastructure needs in an overview fashion. The problem with our infrastructure needs are great. The funding needs outweigh the amount of dollars that are available. In Ohio, the voters a few years ago passed Issue II, which made a 10-year commitment of over one billion dollars to address infrastructure needs. However, as we are finding out, this is falling short of all the highway, bridge, water and sewer improvements needed around Ohio. The legislature also passed an increase in the gasoline tax to help deal with our highway and bridge needs.

During the past years, I have had many problems brought to my attention by constituents and I would like to point out some of these.

First, in the area of water, I think there are three basic problems that we have with our water systems. First is of course having an adequate water supply. Many communities have had a problem with this, we have had problems with reservoirs, either that are old and aging or just simply do not have the capability to supply the water. We have, through Issue II, been able to have many of our communities acquire money for reservoirs, but for new reservoirs acquiring money is much more difficult.

While many communities have a problem, especially those that are not along the river, in having adequate water supplies, it seems the more pressing need is in the water delivery system. Many communities have old water lines which break and need repair constantly, and they just are not large enough to carry the water necessary to adequately serve the resident. While replacement of old lines if funded under Issue II, new water lines is not. And we, I think all here, support legislation that has been proposed in the Ohio legislature to allow the Appalachian areas to use Issue II money for water line extensions as well as improvements to existing systems.

We are waiting hopefully that that bill will come out of Senate, it has passed the House. Trying to extend water lines usually means relying on Farmers Home, and one problem that is always brought up to me is that since our population is small, making the cost per customer fit into the program guidelines is often impossible. We often have water lines extended within half a mile or less or people and they cannot be picked up, cannot pick up that additional distance to put them on the water system. It is difficult for me to understand that in 1990, we have so many citizens in Ohio that have to rely on wells and springs for water and have no—have to haul water in, in this day and age when water is such a valuable resource. We have an abundance of it here but we just cannot get it to the people who need it.

Moving on to sewer systems, as you know the federal and state government requirements on communities for improvements to their sewer systems has placed a large financial burden on communities and their citizens. The costs are usually over a million dollars and spread over a small population, it makes it difficult for a few people to afford it. It is a very substantial burden and one that we have seen businesses close and people leave because of the increased sewer and water fees.

The other problems I think will be addressed later in attracting businesses and the need for sewer into areas that we are looking to develop with new businesses.

Funding needs for state and local highways and bridges are still out of reach even though the legislature has raised the gas tax. The increase allowed us to make important strides in our maintenance program and new construction. It has also given additional money to local governments, which share in that funding, but it is still not enough, especially for bridge replacements in rural townships which have many unimproved roads.

The President's proposal to place the burden of transportation improvement costs on the state is absurd. As I said, we have already increased our gas tax and I do not believe we would be able to increase it again. What we need is the federal government to release our gas tax money which is held in the Highway Trust Fund, as the Chairman and Congressman Applegate support. It is my understanding that is a substantial amount of money.

Finally, any proposal to raise the federal gas tax should give us assurances that this money is used for highway and bridge construction and repair and not to reduce the federal deficit. The tax is a user fee and should be used to repair our transportation system. The tax should be used to fix holes in our roads, not the holes in our federal budget.

Thank you.

The CHAIRMAN. Mr. Krupinski.

Mr. KRUPINSKI. Thank you, Chairman Anderson. I too would like to thank you for bringing this Committee to the Ohio Valley. I would like to acknowledge Congressman Applegate's influence in making this happen. Thank you, Doug.

During the past decade, southeastern Ohio has been beset by a variety of circumstances which have contributed to high unemployment, particularly in the mining and steel industries, a corresponding decrease in the tax base, and a dramatic decline in population. Any of these three factors would generate a negative impact on the local economy and a decrease in revenue to governmental entities. However, the combination has produced a devastating effect on the county and local governments and their ability to maintain their respective infrastructure systems. This certainly leaves no resources to expand services.

The area is now faced with the reality of being unable to generate revenue as in the past. With less population, fewer vehicles and therefore less revenue from license plates and water and sewer systems, infrastructure budgets have been decimated.

Harrison and Jefferson Counties both have approximately 260 miles of county roads to maintain, and each have 400–500 bridges. Many of our bridges are structurally deficient or functionally obsolete, with weight limits posted at less than legal load. The rough terrain and topography tax the maintenance budget. A severe winter means little funds left for a summer resurfacing program. These major resurfacing programs are needed for both counties. The band-aid repairs are beyond being capable of sustaining the arteries of the area.

Water and sewer systems in both counties vary from virtually brand new systems to a few communities with wooden lines, frequent boil orders and failed septic systems. Approximately four villages in Harrison County are without sanitary sewer systems and six villages in Jefferson county have no sanitary sewer systems. Four to five villages are in need of major upgrading of their water systems. Additionally, various rural sections of both counties need drinking water systems. Due to the sparse populations in rural areas, it is not economically possible to design a water system based on FHA guidelines. This in turn hurts both residential and economic opportunities.

A partial solution to these problems has been the State of Ohio Issue 2 program. Designed primarily for repair and replacement of existing infrastructure systems, Issue 2 addresses only three to five percent of the total infrastructure needs. However, Issue 2 is having a much larger impact in Harrison and Jefferson Counties. Great improvements have been made to roads, bridges, water and sewer systems.

Another partial solution is utilization of the federal Highway Trust Fund. However, this small allotment, combined with low revenue, makes it virtually impossible to meet the 25 percent match. Also, due to our topography and alignment of county roads, current FHWA regulations drive the cost of projects to an unaffordable status for both of our counties.

Harrison and Jefferson Counties are helping themselves. Enactment of piggy-back sales tax, hiring full time economic developers, utilization of exciting resources, are some of the tools they are currently using.

Southeast Ohio has not experienced the economic resurgence that other areas of Ohio and the United States have realized. I do not want to see our youth continue to leave the area. We are faced with an aging population and an aging infrastructure.

I feel a workable solution would be a program similar to revenue sharing. Funds would be distributed directly to local governments for highway, bridge, water and sewer projects, with similar guidelines to the Issue 2 program. A program with minimal red tape that would benefit local communities the most.

Until we can upgrade our infrastructure, it will be extremely difficult to bring in new people and new industry, to one of the most beautiful regions in Ohio and certain in the eastern United States.

Thank you for bringing the Committee to the Ohio Valley and I hope the information that you gather here will be helpful in making your final determination on what legislative approach to take.

The CHAIRMAN. Thank you.

Mr. Secrest.

Mr. SECREST. Thank you very much, Chairman Anderson, Congressman Applegate and Congressman Mollohan. We appreciate you coming to the Ohio Valley to have a hearing and look at the infrastructure needs of this part of the country.

Needless to say, public works projects are critical to the 95th House District and our economic vitality and future growth depend on them.

As most of you know, a solid infrastructure system brings and maintains business and industry to any area of the country. Economic development is contingent on the environmental and transportation systems of any community.

From a transportation perspective, especially rural economic development relies on an efficient transportation system. Appalachia Ohio, and particularly the 95th House District which I represent, does not have the extensive highway system that is required for growth. The past help that has been directed to this area by the federal government is greatly appreciated and has had a very positive impact on the ability of us to move goods in and out of Appalachian Ohio. The mobility to ship goods and products as well as people is crucial for the productivity and quality of life in our area of the country. The federal involvement through the Highway Trust Fund could provide us with additional assistance.

As previous witnesses, and as mentioned by the panel, the $18 billion that is being held would certainly provide a real influx as to us to begin to address some of those overwhelming problems that we face in our highway system.

The same thing is happening in another area that I have some involvement in and that is the Board of Unreclaimed Strip Mines. The funds there, through a severance tax, are also being held to do the same smoke and mirror effect in terms of looking—making the budget imbalance look better than it really is.

From an environmental perspective, we also think that the infrastructure issue needs to be more adequately addressed. Previous witnesses, Representative Cera and Representative Krupinski, both have mentioned the great need in our area of the State for fresh water supplies and distribution systems, for wastewater collection and treatment facilities, sewer systems. It is not only from an environmental perspective that I bring this issue to your attention, but also from a public health and safety issue, the protection of surface water, ground water and drinking water supplies throughout this area of the state.

We in Ohio do realize the importance of helping ourselves and we think Ohio has done that. As also mentioned by previous witnesses, Ohio passed the Issue 2 bonding mechanism that made available $1.2 billion for us to begin to help ourselves with our infrastructure problem.

One aspect of the program to consider when talking about southeast Ohio is that monies are primarily being used to rebuild and improve the existing infrastructure. And also the need far outweighs the ability of us to fund that program.

As previously stated, this area needs additional federal assistance and commitment from the federal government regarding public works and infrastructure framework creation.

I live in a small town of about 450 people and we have recently tried to secure a wastewater treatment program in that community. And with some success, we were able to get a 75 percent grant and 25 percent of that project had to be funded through a low-interest loan which of course, again, the folks in the community were very glad to have available to them. But in the end, having to borrow that 25 percent money for that I think little over two million dollar project meant that the residents of that community were going to have to pay somewhere between $30 and $40 per month for a user fee, which needless to say, if your income is 300 bucks a month and you are on a fixed income, that is a substantial amount of money to have to try to retire that loan. In addition, you are talking about a small town with a budget of maybe $30,000–$40,000 per year, trying to retire or help retire that kind of an overwhelming requirement that they just cannot—either struggle to meet or cannot meet. So what we have in place sometimes does not meet the need because as Jerry mentioned, even if the program is there, the community does not have the ability to repay those 25 percent matches that may be available to them.

So in closing, again I would like to thank the Committee for coming to southeast Ohio to give us an opportunity to share with you our concerns and our perspectives. There are things that I think the federal government can do and maybe should do, and I think one of those things has always been mentioned and that is to try to apply whatever gentle pressure you can to release that Highway Trust Fund that is there and also to look at something along the concept that used to be the old federal revenue sharing where monies can come directly again to the local communities to help them begin to directly fund some of the needs that are there.

And with that, I thank you very much for this opportunity.

The Chairman. Thank you.

Our next witness is the Honorable Rob Burch, State Senator from the 30th Senatorial District. Rob.

Mr. Burch. Thank you, Mr. Chairman, members of the Committee. I am appearing here as a State Senator representing five counties in eastern Ohio; Tuscarawas, Harrison, Carroll, Columbiana and Jefferson. I am speaking from the perspective of our State of Ohio in general and in particular those of us in eastern Ohio.

I also would like to thank you and the Committee, Congressman Mollohan, especially our Congressman Doug Applegate, for your leadership in bringing this Committee to eastern Ohio to hear about our problems first-hand. I would like to ask your indulgence for about 30 seconds to digress from the specific topic of this hearing.

As was indicated earlier, you are meeting here at a time of great tragedy and crisis in eastern Ohio. A little over a month ago, of course, the tremendous flooding and death, overwhelming tragedy in Shadyside in Belmont County, the devastation in Harrison and Jefferson Counties that does have an infrastructure component. Just within the last two or three or four days, we have seen that same kind of tragedy revisit Belmont and Harrison and Jefferson Counties and expand into Columbiana County.

In addition to the general subject of infrastructure, I would request that you mention to the appropriate committees that I think perhaps some oversight in our emergency management services is greatly needed as well. We have, in this time of tragedy, come to realize first-hand—and perhaps that is the only time you see it—that there can be some improvements made in the way that we deliver emergency management services. We have got to cut down on the red tape, we have got to cut down on the bureaucracy. We have got to recognize the need for emergency response. And I am not obviously directing this to you, and I am not generally complaining. We appreciate the help that has been given, but at a time when we read about deregulated savings and loans and the idea that someone with a $1,000 investment can get almost a two billion dollar federal handout or authorization or borrowing ability and authority using the full faith and credit of the government, I think that perhaps we could be a little bit more responsive to these citizens that are in such dire straits, and make those dollars available on a little bit more of an expedited basis.

This is not the time, this is not the Committee, this is not the hearing, but if you could bring that message back—and I know Congressman Applegate in particular has been very outspoken in working with the mayors of Dillonvale and Adena and Shadyside and other communities that have seen the need to respond with a little bit less red tape and a little bit more compassion under these circumstances.

I am not going to talk about specific projects. You have heard from the State Representatives, you will hear from our county engineers and commissioners.

I would like to speak first about eastern Ohio and then two general recommendations for some things that you can do specifically at the federal level that would help us.

Historically, as has been mentioned, eastern Ohio has been one of the primary industrial engines that built this country into the economic power that it is today. For years, we sent our tax dollars to Columbus and Washington and when times were good we were willing and happy to do that, to help other less fortunate parts of the country.

The last decade has not been good for eastern Ohio. We in eastern Ohio have not shared fully in the economic recovery that we have seen in other parts of the state. We in eastern Ohio now need that kind of specific targeted direct assistance from federal and state governments, and particular in the area of infrastructure that is really a key component of economic development.

There is no greater economic tool than a well-placed highway and items like railroads and airports, sewer systems, waste treatment facilities—these are the building blocks of economic development and that has to be our top priority in eastern Ohio.

As I said, I would like to speak generally. In past years, in past decades, in many areas of public policy, including infrastructure development, we have had a federal/state/local partnership. Unfortunately, in my view, the decade of the 1980s—and it has not been from this Committee but frankly from the Executive—has been in retreat from that historic partnership. You have been withdrawing. Again, the Executive has led the retreat and withdrawal from that historic partnership.

My first general recommendation is that the federal government must reclaim its role as a full partner with state and local governments. Do not just tell us jointly with us what we should be doing or have to do, help us raise the money and provide the funds to do the job.

I would request that you move to restore the levels of funding in past years and also the percentages of funding that you provide in federal participation. And I know these have been cut in almost all areas of public works and infrastructure development.

As has been mentioned, we in Ohio, I think perhaps more than any other state, have done our fair share. We raised taxes in 1983 to balance our budget and put our economic house in order, providing a foundation for growth in the remainder of that decade. We raised state gas taxes twice in the last four years. As you know, that is not easy. We have increased the percentages going to local governments, we have allowed local governments significant authority to raise their own license plate fees, which gives them more revenues to work with in highway and bridge construction and maintenance. Again, you have heard about Issue 2, the $1.2 billion Constitutional amendment that Ohio voters passed overwhelmingly in 1987. There is no other program that I am aware of in any state that is comparable, either in the size, the magnitude or in the focus exclusively on local government projects and priorities. Those are not state projects that are being funded. Those are all dollars, $1.2 billion, going direct to local governments over a ten year period. And we have done a number of other things to put funding mechanisms in place, particularly in the area of environmental protection.

We in Ohio are doing our part, but we need the full participation of our federal partners if we are going to accomplish the job that has to be done.

Having outlined what I think are our Ohio accomplishments, having made a general recommendation that you join with us again as full partners in addressing these problems, let me mention two specific things that frankly would not cost you any additional money, but that I think would be of great assistance. And again, I am kind of preaching to the choir and repeating what others have said.

First, take action at the federal level to address the federal budget deficit. In the long-run, that will make us a stronger, healthier country economically. In the short-run, it will release the pressure to withhold those highway and airport and other trust fund dollars that are artificially masking the federal budget deficit. You have heard, we need those dollars. I assure you they will be well spent.

Second, where appropriate, take—and again speaking from an eastern Ohio perspective of economic distress—where appropriate take into consideration the economic distress of the region or state in determining where your limited infrastructure dollars are going to be placed, and the way, the manner in which they are going to be utilized. Obviously we all need more money. We know there are dollars that are limited, but in targeting those resources, I would request—again speaking for my own particular bias as a representative of an economically distressed area—take those economic factors, unemployment levels, poverty, these indications of financial difficulty that have been referred to, take that into consideration in deciding where to put those dollars, number one, and number two, the way in which they are made available. As Representative Secrest mentioned, grants and low interest loans are much preferable and much more usable to us than market-rate loans or other kinds of funding mechanisms that we may not have the ability to utilize.

In conclusion, again economic development and job creation is our top priority because of the distress we find ourselves in. And your focus on infrastructure development is perhaps the critical component of that. I do appreciate the opportunity to be here. I know you hear all of our problems. We appreciate what you have done and the leadership that you have provided and we would encourage you to continue to move in the direction that you are, in the area of the Highway Trust Fund and the other efforts at the federal level that you are mentioning.

I appreciate your taking the time to make the trip to eastern Ohio to share these moments with us. thank you.

The CHAIRMAN. Well thank you, Senator Burch and before we ask our questions of this panel, I would like to present Congressman Mollohan.

We have been joined by an outstanding colleague from just across the river, Alan Mollohan. Alan serves in Washington on the powerful Appropriations Committee and has been a champion of efforts there to assist the people of this region as you strive to revitalize your economy, something that can only occur as you rebuild your infrastructure. Alan, I am pleased you could join us and add your expertise to these proceedings. Would you like to have a few minutes or make a little opening remark there before we ask questions?

Mr. MOLLOHAN. Only to thank you, Mr. Chairman, for inviting me to participate in your hearing today. When Congressman Applegate called me, I of course very much wanted to and he was very kind to include me in his hearing here and invite me to participate with you on this panel, as he always does because he has a terrific spirit of cooperation, he understands that is how we best get things done.

Let me take this opportunity to thank you publicly, Mr. Chairman, in our home territory for your being receptive to our needs. I can remember about six years ago when I was a pretty new Congressman at that time, I talked with Congressman Applegate about our Weirton bypass and the bridge projects up there, and he said well you need to go talk with Chairman Anderson. So I went to Chairman Anderson and sat down and told him our plight with regard to the bypass and how we needed a little push there. And he granted our request for a primary priority highway designation which I think is helping us mightily and I just wanted to thank you publicly and this is a good opportunity to do it.

Thank you for allowing me to be a part of your hearing today, Mr. Chairman.

The CHAIRMAN. I wrote a couple of things down while each of you were talking.

Senator Burch, regarding federal emergency response, let me say that our Subcommittee on Investigations and Oversight has been examining, even before the Shadyside tragedy, the effectiveness of FEMA—that is the Federal Emergency Management Administration. We are now, at Congressman Applegate's urging, redoubling our efforts in this area.

Mr. BURCH. Great.

The CHAIRMAN. So we are working on that.

Mr. BURCH. I do want to apologize for raising it at this time, but it is not often that we get the chance to talk to—although we see Congressman Mollohan and Congressman Applegate regularly—we wanted to take this opportunity and I am glad to hear that Congressman Applegate, as usual, is far ahead of us. We appreciate that.

The CHAIRMAN. Then you have passed a state gasoline tax increase and I might just throw out to you when they ask you questions, what is your position on a federal gasoline tax increase. And first, what is your position if the new additional revenues are used for improving transportation, and second, what would your position be on a gas tax increase if the revenues are not spent, but instead used for deficit reduction as some are proposing. I would like to have you—I think I know how you stand, that is all right. [Laughter.]

And Representative Krupinski I believe testified that more federal assistance should be channeled directly to local governments, bypassing the state. And that is not a position we always hear from state officials and if that is a position that the rest of you would advocate, you might mention that as we start out with our questions here.

My general questions for the panel of state legislators—as state legislators, what priorities do you give to public facility projects and how do you see their impact on the economy and development within your state. And second, how do you see the financial burden being shared by federal, state and local governments, which kind of overlaps with a couple of others. So you can start anywhere you want. Those are my questions, then we will hear from Doug and then we will hear from Mollohan.

Mr. CERA. I guess I will start.

The CHAIRMAN. Well C always comes before B anyway.

Mr. CERA. I was always a good lead-off hitter in baseball.

On the—to start out, I think I mentioned in my testimony on the gas tax, you know, I think all of us have voted for the state gasoline tax, I know I have always. And one reason why I feel that I am able to do that is because we can show a direct benefit. That is one tax that we can pass that people actually see construction occur and see their dollars coming back into their areas. As an example, the project that has been mentioned today, the Bellaire Route 7 relocation here just a few miles down the road from here, is a 50 plus million dollar project in a town of 8,000 people, and it has been on the books for 50 years. We are very happy to be able to have that project going. So I think that when we do gasoline taxes, we feel comfortable when passing those, knowing that they are going to go to highway construction and bridge repair and construction. I think, however, if we on the state level would try to convert—which we cannot constitutionally, but if we tried to convert—divert some of our gas tax money to other things, we would end up in the Ohio River as elected officials. And I would think that Congress would probably have the same response given to them by their constituents, these are taxes that are paid for people to travel the highways and as somebody who buys a lot of gasoline, I certainly like to know that that money is going to go to improvement to those highways.

So I would hope that it would not be used to reduce the deficit. And if that is the mood that the administration has, that it should go to that, then I think that there should be no gas tax increase at all, because what that does is hurt us in our own efforts in trying to raise taxes.

One reason we were able to get the votes to pass our gas tax is that we kept hearing from Washington there is going to be a gasoline tax of anywhere from 10 cents to 25 cents a gallon. Well the urgency of that helped push our gasoline tax through. But I think if you are going to pass it, use it for the infrastructure needs of our highways.

The impact of these projects is great. We have an area that has steadily declined due to reduced employment, mainly in the coal industry, that has caused a great many people to leave the area and to be displaced and placed on public assistance. And we are looking at our transportation needs, and especially as an example, the Bellaire project, acommunity that has drastically lost population. While it has lost additional population because of the relocation of this highway, we view it as a way to rebuild the city once the highway construction occurs.

So I think that it is vital for economic development; not only highways and bridge repair, but also sewer and water. The problem we are facing—we are talking about communities, for instance in my District, there are only three cities in my District, the rest are towns, villages and unincorporated areas. So therefore, most population centers are under 10,000 or in most cases under 5,000 people and it is difficult for those small communities to bear the burden of these projects, whether sewer or water or whatever, because they just do not have the money to come up with.

Bellaire, as part of its share of that project is looking at probably having to eventually pay nearly two million dollars for—as its share of the project, when you are looking at a community that has a general fund budget of $900,000 a year. You can see that it is very difficult to come up with that type of funding locally to do those projects. However, if we do not have those projects, there is no opportunity for growth.

So I think if anything can be done to address—and I think on the state level we need to address how we can maybe change our own laws on how we view these small communities and helping them pay their share on these projects because they are simply out of the reach and these are projects that are much needed. However, even if there is state and federal money available, if there is no local money available, we have run into a barrier there and we need to address that.

The CHAIRMAN. Mr. Krupinski, do you have some comment?

Mr. KRUPINSKI. Well first of all, with my recommendation on the federal revenue sharing coming directly to the communities, you did not get any resistance from me not putting it through the state, because as I recall the state gets a portion of that revenue sharing as well. They get a direct allocation, as well as the local communities. You know, when I mentioned revenue sharing, that is basically what I had in mind. But if it were to come directly to the communities and not through the state, I would have no objection to that, because whatever funding you folks on a federal level can send down to our local elected officials and communities, that is that portion that we do not have to worry about as state legislators and state government.

As far as the gasoline tax increase, you would have a hard time convincing me of the need for a gasoline tax increase when there is $18 billion plus that we are having a hard time turning loose.

As far as balancing the budget with a new gasoline tax, there is no way that I would even consider supporting such an idea. I think it would certainly be detrimental to areas line mine, states like Ohio, who as I mentioned in my statement have not caught up with economic resurgence as other parts of the state.

My priorities as far as infrastructure projects, I could think of some right now, communities—one community in particular that was affected by the recent flood, it is an unincorporated area, new town. These folks have a very unique problem in that they have no sewage, they have no water. There are 59 homes in that little community. All 59 homes were underwater, at least the basements, for an extended period of time. It had the result of contaminating their water, with their own, malfunctioning to begin with, sewerage collection plant. They now, even at this moment, some 30 days after the flood, their water supply is contaminated. If I had it within my power I would combine ARC funding—the county commissioners have shown an indication to use their community development block grant funding to go toward that project. There is still quite a gap to be filled and I would like to see state and federal dollars used to fill that gap and give those folks the help that they need.

The CHAIRMAN. Mr. Secrest.

Mr. SECREST. Thank you very much again, Mr. Chairman.

I guess I will start off with my remarks about the increase in the gas tax and then using that for deficit reduction purposes. That issue to me is like others where a tax is either levied or collected for an express purpose, and then to use that for something else, when the need in that area is obviously so great, is just a matter to me of public deceit, that you impose a tax for one purpose but you do not use it. You hold it back and you do something else with it. My recommendation I guess would be rather than try to manipulate the deficit, is to do something directly and bold about it and hopefully take care of that issue and then those things that are being held can be used and redirected back for the purpose for which they are being collected. So I guess in essence I would oppose any kind of collection of a gas tax for the purpose of budget balancing.

The other issue, and it is the kind of follow up on something Representative Krupinski raised, which in my testimony I kind of alluded to that I support also, was the idea of money going directly back to the local governments. Some of that I was speaking to was in terms of water and waste water monies, not just highway monies coming back to the local. But also, I think the state has a greater ability even to raise highway funds and address those kinds of issues than some of the local governmental entitles have the ability to do. so I would rather see us trying to take care of our needs and then you helping us take care of the political subdivisions underneath the state, and in the sense of a partnership kind of an effort.

On the other hand, the issue of how important this is to us—and I think we have all, in our initial testimony, kind of touched on that, and I think maybe Senator Burch had one of the best lines I heard any of us give and that is "a well placed highway is one of the best economic development tools that a community can have," which I would reiterate and I think that is a point well taken.

In addition, the public health issues in terms of wastewater and water treatment projects, and the environmental impacts of sewerage leaching out into the water table in rural Ohio and other parts of the country—I mean it is kind of self-evident, the positive impact of taking care of those kinds of problems.

And so with that, I would say continued funding, continued partnership of the state, the federal and the local political subdivisions working together on these issues, infrastructure issues, is extremely important. And I will, in closing, again applaud you folks coming to this area of the country and allowing us to share with you our concerns so we can hopefully move forward in a collective effort to address some of these issues.

The CHAIRMAN. Mr. Burch.

Mr. BURCH. I will just say "me too". I agree, particularly on the gas tax, with everything that has been said.

There may be reasons like conservation or efforts to redirect some of our reliance on various transportation means that we might want to look a federal gas tax increase, but I certainly would hope that it would not go for deficit reduction. We have needs out here that have to be met. If for conservation purposes or other valid purposes, you think a federal gas tax increase is in order, let us use those dollars for roads and bridges and mass transit, and not have it used to offset a federal deficit that ought to be addressed in a more progressive and more dramatic and more effective way.

In terms of the type of federal help, again I think I made my general point that we need you to again become the full partners and the real leaders that you were for so many years until the philosophy of retreat and federal abandonment seemed to take hold in the Executive Branch, beginning around 1981 I think, if we had to pick a year to begin counting from.

As an example of the type of help we do not need, I would point to the March, 1990 new transportation policy from again the Executive Branch that tell us what we already know, and it was an outstanding statement of our multi-modal transportation needs and we do join you in recognizing those and we want to work jointly with you, but when the—again when you then go on to recommend cutting federal participation levels, increasing state and local government money, decreasing federal money, thanks but no thanks. We just cannot use any more of that kind of assistance frankly. And I would hope that that report by Secretary Skinner is not illustrative of what some of the other departments are going to do in terms of how they approach their jurisdictions.

We need your help. You have provided great leadership in the past and we need you to again join with us in not just planning and identifying, but paying for, the improvements that we need.

And I again thank you for coming here this morning.

The CHAIRMAN. Mr. Applegate.

Mr. APPLEGATE. Thank you very much, and I want to thank each of you for coming to the Committee and very eloquently outlining what I think is a pretty general theme, and talking about economic development and jobs, transportation and health and the full partnership of the federal with the state and local, which I think is very good.

You have all sounded the theme and frankly I want to commend you. I want to commend the legislature for really assuming the responsibility and not only—you know, the old thing about you practice what you preach, and this is what you have done. You have raised the taxes, in light of an era when people are just opposed to any kind of taxes, I think it was a courageous thing to do, but the dollars are coming back and they are seeing that they are being spent, and that is what people basically want. And they do not want the idea of the federal government looking at the idea of increasing the tax, which there have been proposals of 25 to 50 cents per gallon of gasoline, which is the most ludicrous idea I have ever heard of, and using that for deficit reduction. If we do that, then we can kiss it all goodbye because people are going to be so disgusted and they are going to say whatever happened to the integrity of this country and to the promises that were made that this money was going to come back and help in our infrastructure, and here we are going to try to balance a budget deficit which has been building because of the ineptness of the administration, and the fault of Congress too.

And so I do not think we can continue on that line. So I would just commend you for your responsible judgments that you have made and I think you have done a very good job. My compliments.

The CHAIRMAN. Mr. Mollohan.

Mr. MOLLOHAN. Thank you, Mr. Chairman.

I just again appreciate the fine testimony here from Congressman Applegate's colleagues.

I would like to ask briefly—oh, first of all, I would like to thank Jerry and Rob for your support of the Weirton—the rest of you fellows do not have a particular interest in the Weirton bypass—for your understanding of how important that linkage is to the airport for economic development in our area.

I would like to ask any and all of you, where do infrastructure public works projects, water and sewer, bridges, not to mention airports, rank in your priorities, as you assess the needs of your communities? And to the extent that it ranks high and you think that we need to invest additionally in that area, where do you feel the funding should come from for additional infrastructure investment, and what should be the share between federal, state and local in that funding responsibility? Any of you?

Mr. KRUPINSKI. I will start off, Congressman, we will start with the K instead of the C this time.

My response to that would be that I think in this case quite possibly the federal government could take a page out of what the State of Ohio has already done. We did offer legislation to put on the ballot a Constitutional amendment allowing for what turned out to be what we call Issue 2 funding, which is $1.2 billion, money that would go to our local, strictly local, infrastructure. Quite possibly the federal government could do something very similar to that. You folks are in a position to know your budgets better, the obstacles that you do have to overcome, so I do not think we are in a position to even suggest how you should go about doing that portion of your job.

One thing I would like to reiterate though would be opposition to that additional gasoline tax to balance the budget. It might be—you might be interested to know, Mr. Chairman, and I am sure it would be similar in California, maybe more, but one penny of gasoline tax in Ohio generates over $50 million. Now we have been referred to as a donor state several times already today. We are no longer in a position to be a donor state. You are talking in terms of a 50 cents gasoline tax increase, that is over $2.5 billion that the State of Ohio taxpayers would be contributing to balance the federal budget. We are not that crazy and we will resist that as long as we can.

Mr. SECREST. I would just comment briefly. You had asked the question about the importance in a kind of a priority ranking of infrastructure. To me—I am not going to say it is the most important, but it sure ranks up there because I think if you do not have adequate infrastructure place, a transportation system to move goods in and out, and a water and wastewater treatment system to handle that kind of a program in your communities, then all other development hinges on those things being in place. And almost any economic development person in Appalachia Ohio you talk to or you work with, is focusing on those kinds of things to begin the foundation to build on to bring economic development and vitality and prosperity to Appalachian Ohio.

So—I mean, I do not think from our perspective in this area of the country that there are too many things that are more important than funding and appropriations for infrastructure improvements.

Mr. BURCH. Congressmen and members of the Committee, I guess I see two aspects when you talk about where it ranks in importance, infrastructure in general. The increasing demands of the Environmental Protection Agency, the increasing standards that we all share and applaud if we had a way to pay for them, if we had the means to meet them in our economically depressed part of the state. We have to get the ground water protection, we have to get adequate solid waste disposal facilities, we need sewerage treatment and wastewater treatment to be upgraded, but we need the means to pay for it and we have to be realistic about that.

But frankly, from our perspective, the health and safety component is absolutely critical, but we are forced, because of the state of our economy and what has happened over the last ten years—and I think this part of West Virginia is not much different—we have got to be concerned about the economic development aspects. And all things will follow. If we can get people working again and paying taxes instead of relying on the safety net of services, we can take care of our environmental needs and we can do all the other—our health needs, our housing needs, our education needs, all will follow from economic development. And I think, from my own perspective, that has to be our top priority. We are force as representatives of these kinds of counties in eastern Ohio to think about job creation and retention first and the problems will flow from that.

I guess in terms of the prioritization, it is an absolutely top priority with us and I think again as Congressman Applegate mentioned, we have tried to practice what we preach in the Ohio General Assembly. It is not easy to raise taxes, gas taxes twice. The people support what we have done and I think the dollars that are flowing back into the communities with the infrastructure program demonstrates that people are willing to pay for the services that they want, if they see those services being provided. It is only when they see the money going down some black hole that never seems to materialize back in their area or their county or their village, that there is this general resistance to paying another penny. And frankly, who could disagree with that. If you do not see the benefit, who wants to pay any costs.

Mr. **Cera**. I would just add that if you view infrastructure as part of—our main need, as you know, is the economic development and creating jobs for our people. And I guess if you could view infrastructure as part of that, then it would be the top priority that we have, you know, with our winding roads, and the old saying "you cannot get there from here", and you have the same problem in your District in West Virginia where distance is measured in time and not in miles. We have needs for improved roads, so we can open up our vast areas that are there for—that could be developed, great numbers of acres of land that could be developed for want of new highway systems that can bring people into our areas.

I think in the area especially of sewer and water, for the small communities, the problem is that local share that they have to come up with and the burden it has placed on the citizens to be able to pay for those. In a large city where the costs can be spread over hundreds of thousands of people, it is less of an impact. But as has been mentioned, when you are talking about communities of a few hundred people having to share the cost of a couple million dollars, that two million dollars might as well be two billion dollars. So even though our dollar amounts of our projects are a lot less, when you spread them over the few people that we have, they have such a severe economic impact that there needs to be some greater assistance to these small communities.

The **Chairman**. Mr. Mollohan.

Mr. **Mollohan**. That was the point I kind of wanted to get at. As Doug and I work economic development, the key ingredient—and this is definitely preaching to the choir, because this Public Works and Transportation Committee is going to become—you are looking at the Committee of the future in my judgment, because of the infrastructure deterioration and this country getting around to the realization that we are going to have to build—this Committee is going to be of tremendous importance.

As we look at economic development, it is that infrastructure investment that is the fundamental, and it is so very difficult in our area to do that, because where it costs a dollar to build a road in the south, it costs a hundred dollars in our area to do that, and that is true with water. We are blessed with water, but sometimes we have too much of it, so we need flood control projects, we need those roads and bridges. It is that difficulty of the local communities to stand that percentage cost share that is so difficult in our area. And that is the nut that we have to crack and that is I think of special consideration to areas where infrastructure costs so much more.

Thank you.

The CHAIRMAN. Well, I want to thank the panel for an excellent presentation.

Our next panel consists of four county commissioners, a county engineer and a mayor. The county commissioners are the Honorable Bob Olexo from Belmont County, Honorable Glenn Dierkes from Monroe County, the Honorable Stuart Henderson from Harrison County, the Honorable Tom Laughman from Guernsey County; Howard Stitt, the Harrison County Engineer and Mayor Edward Bowman from the City of Weirton in West Virginia.

Gentlemen, we will try to work you in to the table there and we will question you following your testimony.

Bob, I introduced you first, we can start off with you, but you can make that decision up there. Bob Olexo.

[The prepared statement of Mr. Cera appears on p. 482.]

[The prepared statement of Mr. Krupinski appears on p. 503.]

[The prepared statement of Mr. Secrest appears on p. 581.]

[The prepared statement of Mr. Burch appears on p. 477.]

TESTIMONY OF HON. BOB OLEXO, BELMONT COUNTY COMMISSIONER; HON. GLENN DIERKES, MONROE COUNTY COMMISSIONER; HON. STUART HENDERSON, HARRISON COUNTY COMMISSIONER; HON. TOM LAUGHMAN, GUERNSEY COUNTY COMMISSIONER; HOWARD STITT, HARRISON COUNTY ENGINEER; AND HON. EDWARD BOWMAN, MAYOR, CITY OF WEIRTON, WV

Mr. OLEXO. Congressmen, distinguished Committee members and Doug Applegate—my own Congressman—thank you from all of us for coming to eastern Ohio and the Ohio Valley.

I have presented for the record a document giving specific infrastructure needs for Belmont County, that was presented earlier, but I would ask you to allow me to make my several moments an overview rather than going through that document.

My overview would be the needs of both Belmont County and some remarks on the region, as I see them.

During my 12 years as a county commissioner and presently as President of the Board of Belmont County Commissioners, I saw and experienced the collapse of our basic industries, coal and steel. I saw double-digit inflation and unemployment. In the late 1970s, we had the gas shortage, the astronomical increases in both gas and oil and related by-products, and the end of Belmont County's road paving and repaving program.

For almost eight years, an already old infrastructure; roads, bridges and water and sewer, became older by neglect because we could not maintain and repair them. Funding—federal funding such as federal revenue sharing, ceased and the hole became deeper. Eight years later, starting in 1985, we the Board of County Commissioners enacted the half cent piggy-back permissive sales tax allowed us by the Ohio legislature. Part of that went to roads and bridges. The State of Ohio followed with gas tax increases and Issue 2 funds. Finally again, we were able to begin to do some repair work but it truly has been a small percentage of the need.

Not only have I served as Belmont County Commissioner and President of the Board, but during the past six years, I also served as a member of the Ohio River Valley Development Task Force chaired by Senator Burch, and as such, I chaired the Industrial Development Committee of that task force. I have served as the First Chairperson on the District 18 Public Works Integrating Committee, which included ten counties in southeastern Ohio.

From these experiences, I have learned and have concluded that our future, our future development and success, depends almost exclusively upon meeting our infrastructure needs.

First of all, our infrastructure dates back, in large, to the 1930s and 1940s and 1950s. They are old and they are worn. I am talking about all of them; roads, bridges, our water and our sewer. Recent flooding, of course, has further complicated that situation.

Secondly, when our economy changed and almost collapsed, two things happened. We further neglected our infrastructure so that it became in more disrepair and in order to correct the economic plight, new infrastructure not perceived to be needed before became a necessity. For example, the development of industrial sites with water and sewerage, the Ohio River development with new access to the river, port authorities, additional highways especially north and south.

Thirdly, additionally our survival is clearly tied into regional survival and regional success. This regional development plan clearly calls for:

(1) again the development of the Ohio River recreationally and industrially. This first and foremost means improvement of the locks and dams all the way from Pittsburgh to the Mississippi River, an important but expensive undertaking.

(2) taking advantage of Interstate 70 by opening up Monroe County through the improving of Route 800 to the interstate and Route 7 through Bellaire, and opening up Harrison County through the construction of Route 250 from Cadiz to the interstate.

(3) completing the Appalachian highway.

(4) completing bridge projects and improving bridges between Ohio and West Virginia on the Ohio River.

(5) expanding water development and sewer projects throughout the region, not only to improve the quality of life for our citizens, but to open up parts of the region to development and to protect the environment in the region and in the Ohio River.

Obviously the problems are many. One solution would be additional federal funding through a gas tax that would make funding available for infrastructure and additional funding in such areas as EPA, EDA and ARC. It would also help to rethink many of the restrictions, conditions and local shares attached to these funds.

Gentlemen, thank you.

The **Chairman**. Thank you, Bob.

Before we proceed, I would like to remind the panel of the Committee's need that you restrict your oral presentation hopefully to roughly three minutes each, followed of course by our questions. As I said earlier, your entire prepared statements will be made a matter of record for this meeting.

Again, I do not know which way I go, to the B or the D—Mr. Dierkes, you happen to be the second one on this list here, so why do we not listen to the Honorable Glenn Dierkes—I like that first name too. [Laughter.]

Mr. **Dierkes**. Thank you, Mr. Chairman, Congressman Applegate, Congressman Mollohan and others with us today.

It is a true pleasure to have this opportunity to address this Committee in regard to infrastructure needs of Monroe County and the surrounding area.

In many respects, the infrastructure issue has been discussed many times by many groups, especially over the last five years. And these plans and reports are readily available and should be viewed to supplement my remarks.

Economic development is driven by infrastructure or the lack of it. Some counties are doing well others are suffering. Monroe County has been suffering for many years. We have lost 20 percent of our work force in the past five years and are projected to lose greater than 10 percent of our population between 1980 and the current census.

Transportation. Monroe County has critical needs for highway improvements. We have no federal highways within our boundaries. Of the 200 miles of state highways within Monroe County and other than routine bridge replacements, no major state construction has occurred since the 1955–1965 era. The most recent county construction engineer estimate of funds needed to completely revitalize Monroe County roads and bridge system is $8,750,000.

Water and sewer. Monroe County's water and sewer needs are as large as its transportation needs. Although between one-third and one-half of our population now has public water, less than one-half of the geographical area has public water service.

The situation with sewer is even more pronounced. Four-fifths of Monroe County's population does not have public sewage. The high percent of fixed-income elderly residents would have a hard time justifying their monthly bills on these public systems. Although the federal government does not seem to want to expand social programs, a program modeled after the Rural Electrification Association, only directed at water and sewage, would be of a great benefit.

I have addressed infrastructure and transportation needs, both regional and county-wide in my full report which I have submitted to your Committee earlier.

This has been my pleasure, and in closing, while I have a chance, on behalf of Monroe County I wish to thank both the state and the federal officials for the assistance you have given us to help recover from damages occurring as a result of the June 14 floods. Agencies, including FEMA, the Corps of Engineers and ODOT, along with the Ohio and U.S. legislatures have our respect and thanks for the assistance they have given.

Thank you.

The CHAIRMAN. My third one on the list is Stuart Henderson, Harrison County Commissioner.

Mr. HENDERSON. I would like to welcome you to this area and appreciate the chance of having our county representative here. Thanks, Doug, for inviting us.

We are located like in a mining community and agriculture, and since the mining has dropped down a lot, it has hurt our economy a lot in our county. And also I believe—I am going to go away from a little of this and not talk too much because Howard is here and he has some figures for us—and say that I believe as far as federally funding things, maybe we should stay to the larger ones like Issue 2 has gone to, if you throw back to small things, you may not get as much accomplished, I believe.

And there should be a lot come down—maybe when they give the money, maybe they should see where it is going to and see that the money is getting spent properly.

Let me see what else—I believe for our county, we need—the communities that do not have any water and sewer at this time are kind of left out on the Issue 2 money and it would help a lot if we had funding for communities that cannot afford them and also are not covered under this.

I believe that is all I have right now, maybe Howard will have a little more.

Thank you.

The CHAIRMAN. My fourth name down here is the Honorable Tom Laughman, Guernsey County Commissioner.

Mr. LAUGHMAN. Thank you, Mr. Chairman, members of the Committee, it is my great pleasure to have been asked to appear before you here this morning.

As Commissioners of Guernsey County, Ohio, we do not feel we are qualified to address the needs of the nation's infrastructure as a whole; however, I do think we are quite well qualified to address the Committee concerning the needs of a rural county such as Guernsey.

We are presently facing the problem of a deteriorating infrastructure and the lack of means to address that problem. Not only do we in Guernsey County have a problem with maintaining existing infrastructure, we are also faced with an era of mandates in which authorities of the state and federal governments require us to make large additions and improvements to our infrastructure, for which we face the same problem of a lack of adequate financing.

The first particular item of infrastructure I would like to address is one which the people of counties such as Guernsey County, Ohio are acutely aware of. The problem of which I speak is the maintenance and improvement of a county road system.

Guernsey County, Ohio presently maintains 408 miles of county roads, 380 bridges and ditches and culvert too numerous to mention here today. At the same time we must provide for the maintenance of this extensive system of roads and bridges with funds derived almost exclusively from taxes on gasoline and license tags.

The present budget for Guernsey County's Highway Department is approximately $2.26 million, of which about $890,000 is derived from the gas tax and $1.2 million is derived from the license tag tax.

The gas tax is collected by the state and fortunately is divided equally among Ohio's 88 counties. Unfortunately, however, the license tag tax is divided among the counties in proportion to the number of tags sold in each particular county. The result of this is a glaring disparity between the amount of money a rural county is given to maintain its roads and bridges compared to the amount of money given to urban counties to maintain their county system of roads and bridges. For example, as I have already mentioned, Guernsey County maintains 408 miles of county road with a budget of $2.2 million. In comparison, Cuyahoga County, which has only 40 miles of country road to maintain has tens of millions of dollars with which to maintain these roads, because they sell hundreds of thousands more license tags in Cuyahoga County than in Guernsey County.

We, the Guernsey County Commissioners, took the politically risky step of imposing an additional fee on the cost of license tags last year. But even this generates only a small amount of additional revenue for the maintenance and improvement of our county roads.

Also, state Issue 2 has provided us with some small relief for our infrastructure financing needs, some of which we use on the county roads. The problem remains, however, that rural counties like Guernsey County are faced with the problem of maintaining and improving hundreds of miles of county roads with funds grossly insufficient for the task.

Another problem I would like to briefly touch on facing Guernsey County is that of delivering safe, quality drinking water to our residents. Presently in Guernsey County there are numerous villages and hundreds of families in the unincorporated areas who have water which is distasteful and unsanitary and inadequate in supply. Every day we hear from citizens who rightly complain that they have a lack of water or poor quality water from their wells. We agree with them, that in modern American no one should go without an adequate supply of safe drinking water. The problem is, how does a rural Board of Commissioners finance the millions of dollars that it costs to extend safe drinking water to the periphery of our county?

A third problem that we face in Guernsey County is that of wastewater treatment. Recently, with the assistance of our Health Department, we compiled a list of what we refer to as hot spots—those residential pockets and communities in Guernsey County that are in need of wastewater treatment. That list produced more than 25 hot spots and I know there are other areas in the county that we have not yet counted.

Recently the Ohio EPA mandated that we install sewer systems in two communities in the unincorporated areas of Guernsey County. We, the Guernsey County Commissioners, did not object to these mandates because essentially that the need to provide sewer to these two particular areas exists. In fact, as I have already mentioned, many more than these two areas are in need of sewer in Guernsey County.

We are presently investigating the means by which we can finance the installation of these two mandated sewer projects. We feel that we do have the bonding capacity to finance these projects, however the question remains, how will Guernsey County finance the mandates which are sure to come in the future, to provide sewer to the other affected areas in our county when our bonding capacity has been used up.

In closing, I would just like to say again on behalf of my fellow Commissioners, I appreciate this opportunity today to address this body. Thank you.

The CHAIRMAN. Thank you very much, Tom.

At this time, I will recognize Howard Stitt, Harrison County Engineer.

Mr. STITT. Thank you. I am like Doug, I get all choked up I guess when I get asked to talk.

Thank you, Mr. Chairman, members of the Committee. I will try and keep this very brief.

Probably working with Issue 2, which Ohio passed, I am the chairman of the local committee for the eight counties and also on the Small Governments Commission, the biggest thing I can say about that is it is a great thing but there is not near enough money. We are addressing three to five percent of the total need.

In our area, it has made a major impact. We have probably got more than our share because we need more than our share and it has come back but it is still well under the needs of the total state. I caught a lot of flack because our district got two million of the 12 million of the small governments, but that just re-emphasizes the need is there. We were competing statewide and yet we were able to compete well because, you know, the other areas of the state are in a lot better shape.

Economic development—Harrison County has worked hard. We have got 500 acres that the coal company has given us, we have two industries going in there now. We built a highway through it, we are seeking federal assistance to pave that highway, which I am sure we will get. Again, our highway system is like the rest of them, we have a terrible lack of money. We are the smallest county in the State of Ohio, therefore, we get probably—we are right down there at the bottom of the barrel as far as license plate money that comes in. There is not enough to do what you have to do. And as mentioned before, if you have a bad winter, you spend all your money in the winter on salt and you have nothing left for the summer. This year we are spending it all on floods. If the people from FEMA are telling me correct, we should come out of that all right. We have met with them and so far they have been—while it took them a long time to get here, we have met with them and things are looking good in that direction.

Federal highway funds that do come down, the only complaint I have as a rural county engineer, many times the regulations that not only the feds and the state put on them, it is cheaper for the county to do it themselves than to participate in the federal program. An example, about four years ago we had a bridge project, all we wanted to do was replace a bridge that was narrow, had like a 10-ton load limit on it, the alignment was reasonably good, the feds and the state mandated that we improve 300 foot on one end, 200 foot on the other end. We ended up scrapping the whole plan, put the bridge in with our funds for less than the 25 percent that we had to match the federal dollars. Therefore, the federal dollars are there and sometimes it is not worth trying to go after them. I think the regulations needs to be looked at in the rural areas, they do not apply—you know, this road had 200 cars a day and does not need to meet the standard of 2,000 vehicles a day. Those need to be looked at.

One thing that I wanted to show real quickly here, what a major impact—we need highways and we need economic development. Doug has mentioned before and it has been mentioned by a couple of people, Bob Olexo—Cadiz sits approximately here, we are 16 miles from U.S. 70 at St. Clairsville. This one, while it has not been 50 years to build, as someone mentioned on I think the Bellaire project, we have been at least 35 trying to get it. About six years ago, I got the coal company to agree to sell all the land and they set a maximum of $100 an acre on any right-of-way. The plans are partially completed, some sections we are totally completed, but it would have to be updated. By connecting this section here with what is happening from Steubenville, Cadiz sits right here in the middle of the hub, we are only 90 miles from Cleveland, they are working on a four-lane coming out of—250, coming out of Uhrichsville, supposed to be part of the new project, we have only about 14 miles there to connect us there. That would make Cleveland right down to St. Clairsville—this is built.

You have the same situation coming up from Columbus, 22 is proposed part of that to be added to four-lane, there are two bad hills in there or three, if it were improved, you would have a straight shot to Pittsburgh. If this section of U.S. 250 could be built, it would probably have as big an impact on the total area as far as economic development as anything else that could be done.

I do not want to take any more of your time, and I appreciate you having us here and I appreciate you being here to listen to our concerns. Thank you.

The CHAIRMAN. Thank you, Howard, for your presentation.

Our final witness on this panel is the Honorable Edward Bowman, Mayor, City of Weirton, West Virginia.

Mr. BOWMAN. Thank you, sir.

Congressman Mollohan, Congressman Applegate, Chairman Anderson, my name is Edwin J. Bowman and I am the Mayor of the City of Weirton, West Virginia.

I believe everyone here today knows that Weirton is located just on the other side of the Ohio River from Steubenville, Ohio. Thirty-five percent of the 8,500 employee-owners at Weirton Steel are residents of the State of Ohio. My point is, as Doug knows well, that the economic development area in the City of Weirton has a direct effect on the State of Ohio. I have come here today to testify on the importance of the completion of the West Virginia Route 22 bypass, which is situated just beyond the city limits of Weirton. It is my understanding that this project consists of approximately 1.3 miles of highway and has a cost of approximately $50 million.

On May 4, 1990, the ceremonies were held for the opening of the Veterans' Memorial Bridge, which connects the cities of Steubenville, Ohio and Weirton, West Virginia. During these ceremonies, Governor Celeste announced that he had authorized the acceptance of bids for the final phase for the Ohio 22 bypass. There is no question that this was good news; however, even when the Ohio 22 bypass project is completed, without the completion of the West Virginia 22 bypass, we will have an incomplete transportation system. Only with the completion of the West Virginia 22 bypass and the completion of the Ohio 22 bypass will we have the transportation system that will create economic development in the State of Ohio and the northern panhandle of West Virginia. For it will be then, when we will have a direct means of highway transportation from Columbus, Ohio straight through to the Pittsburgh airport.

We believe strongly that the Greater Pittsburgh Airport expansion presently underway creates tremendous potential for economic development in the Ohio Valley and in particular, the West Virginia northern panhandle and Jefferson County in the State of Ohio.

Time is of the greatest essence to capitalize on these development opportunities, but without the completion of the West Virginia and Ohio Route 22 bypass projects, we can kiss these opportunities goodbye.

Gentlemen, due to being out of town, I learned just Friday of today's hearing and therefore have been rather brief in my comments. However, since the planning of this 22 bypass project began approximately 20 years ago, we have accumulated a volume of information on this subject that we could provide you with upon request.

Chairman Anderson, I too would like to reiterate Congressman Mollohan's appreciation in behalf of the residents of the City of Weirton, West Virginia, because we are well aware of your help to Congressman Mollohan to designate the bypass project as a priority primary route. I believe I can speak for Congressman Mollohan when I say he and I would like to reciprocate with a favor. The 22 bypass project can also help with the overcrowded highways in your State of California. Because of the job opportunities that would be created, we can bring home to the Ohio Valley those of our residents who traveled to California seeking employment. [Laughter.]

In closing, sir, I would like to thank our neighbors in the State of Ohio and especially Congressman Applegate, in giving me the opportunity to be a part of today's hearing. Thank you very much.

The CHAIRMAN. Thank you, Mayor. I will not comment on your suggestion. Awhile ago, I was thinking of some things we could trade. One thing we would love to get is some of your water.

Mr. BOWMAN. We could strike a deal.

The CHAIRMAN. Anyway, I have just one question for the panel and then I will turn it over. And I think some of you already touched on it, and that is, do you think the current federal share formulas in existing public works legislation are fair. Some of you already touched on it a little bit. Anyone want to comment?

Mr. OLEXO. I will start. I think in my testimony I said we need to rethink—definitely rethink some of the conditions and the local shares required in a lot of federal funding. Certainly as rural counties and rural communities, we have a very difficult time coming up with local share.

Mr. **Stitt**. I would also say the same thing. Issue 2 in Ohio is 10 percent, is the maximum local share, and even some communities are having a lot of trouble coming up with that 10 percent—90 percent is a grant, but what Ohio has done in going into is not only a grant, we are now looking at a loan program with this money, but it is based on their ability to pay. In other words, it is based on how much and the wealth of the income to determine who gets what percentage, whether it is grant or loan. And a system similar to this would help the communities that cannot afford it, where the ones that can afford it can pay more of their own share and therefore spread the money out and make it go a little farther.

Mr. **Dierkes**. I fully agree. The small entities such as the townships and the villages within our counties and other smaller counties simply cannot take advantage of some of these programs because they do not have the 10 percent or whatever match is needed. Therefore, I think it is not fair and I think that needs to be addressed.

The **Chairman**. Mr. Mayor.

Mr. **Bowman**. It is my opinion from my knowledge of the sharing process with the federal highways, I am of the opinion that that is a fair process. However, where my problem lies at is in with the water and sanitary federal mandated projects. There is an area where most of these projects that are mandated to the municipalities are without question always passed on to the citizens. This is a great burden in the City of Weirton, West Virginia where we are in the process currently of undergoing a major overhaul of our water and sanitary plants within the City of Weirton. And although we do believe that this will enhance the economic development in the future, it has been a very tough process as a matter of dealing with the citizens and them absorbing the cost.

The **Chairman**. Mr. Henderson.

Mr. **Henderson**. Yes. I believe that we need to be funded at least 90 percent really, I mean to have any chance of even making it at all. Population I think is what is hurting us more so than anything because the towns are spread out and everything.

Thank you.

The **Chairman**. Mr. Applegate, do you have a question for the panel?

Mr. **Applegate**. Thank you. Not too much of a question except just to say that with the state legislators, with the local people who are here, I think we are still sounding the same general concerns and same general theme and that is, as was pointed out, full federal participation, more money needs to go into these distressed areas. We have to look at economic development increasing the number of jobs, try to keep our young people here. We are looking at health, we are looking at new transportation modes. We are trying to keep our small communities in existence because that is what I have, I have all small communities, Steubenville is the largest with 25,000 people, but I have so many of them that are only two or three hundred people in them. Places where, as was pointed out earlier, where there is contaminated water because of flooding situations, no way to resolve it. And I think everybody is talking about the same thing, Mr. Chairman, and it is something that our Committee is really going to have to take a very strong look at.

And I want to praise them, because these are the people that are on the firing line. They are back home where you see your people on an eyeball-to-eyeball level every day. And when there is a problem, they come and see you first and they will say we have got this problem and you say, gee, I would like to help you, but I do not have the money.

It is easy for us in the state legislature and in the Congress, we can go back to Washington and to Columbus and we do not have to look at everybody every day. But we are there trying to help, working as a full partnership with the local officials, to be able to come up with the resolutions. So I really commend all of you for staying in there too, because it is not easy on a day-to-day basis having to take the brunt of a lot of the criticisms and not having all the necessary monies to be able to do what it is that you want to do.

And with Ed Bowman, who is a very outstanding Mayor of Weirton, West Virginia, in talking I was showing Mr. Chairman what we are talking about here, amongst other things. The Ohio River of course comes across and Steubenville sits right here on this one side. We have a new bridge that cost about $60 million I think. The Steubenville bypass is about 16 miles long, big four-lane highway, it is about $115 million I think or so. And the Weirton bypass, which is still hanging because of a lack of funds, only about one and a quarter mile, do I understand?

Mr. **Bowman**. Yes, sir.

Mr. **Applegate**. And it is what, $25 million?

Mr. **Bowman**. Approximately $50 million, Congressman.

Mr. **Applegate**. Fifty?

Mr. **Bowman**. Fifty.

Mr. **Applegate**. Boy! And what Howard Stitt showed, that map, coming from Cadiz, which is out in here and bypassing Steubenville, opening all of this for potential economic development. And I understand now that U.S. Air is already in the process of buying some of this property to help develop it for reparation of some of their planes and all, with a landing facility.

But coming across that bridge and then running into Weirton and then having to go through a very heavily congested area of Weirton with this little one and a quarter mile. That is the key link, that is the last thing that we need to go through in order to get up into the Pittsburgh area and to this new airport expansion program. They are going to spend four to five billion dollars in expanding that Pittsburgh airport, and they are in the process of doing it. I am talking about, this is an international airport and it is a huge thing, with—there is going to be so many little satellite industries and they are going to be looking at areas like ours, they want to come into West Virginia and into Ohio because of the tax base and a lot of things that we were talking about.

We have everything going for us to attract that into this area. And that is why this is so very important to conclude this. And it will mean much to this whole area up and down the river. So I just wanted to point that out.

And again just to commend all of you. I know that each of you have problems in your own area and we continue to work with you to try to help you get those monies, but thanks for being here too.

The CHAIRMAN. Thank you, Doug. Congressman Mollohan.

Mr. MOLLOHAN. Well Doug has—what Ed Bowman stated, Doug has reiterated very eloquently and again I think Doug's illustration there can give the Chairman an illustrative idea of what we are talking about and how important your agreeing to upgrading the designation of that route. It has been a powerful incentive for the state to spend its dollars up there. I think it increased the match to 19-1, $19 of federal money for one dollar of state money. And we appreciate all the support we can get for that bypass. Weirton is a—along with the whole upper Ohio Valley, is a great industrial area that has suffered some real economic setbacks and as you have heard here today, infrastructure development is key to that resurgence. As Doug pointed out, we see that linkage with the airport as being kind of a linchpin really, of economic development in our area.

So we are really hitting you upon this bypass, are we not, Mr. Chairman. [Laughter.]

The CHAIRMAN. That is what we are here for I guess.

Mr. MOLLOHAN. We do not want to over-emphasize it, but I do not have any questions. I want to thank Ed for his excellent testimony. He made his point and maybe I can think of another deal for the Chairman. I am not sure, when he thinks about the one that you proposed, that that will be attractive.

I want to compliment Doug Applegate on the fine representatives he has over here. I was very impressed with the last panel and I am very impressed with this panel. You all have done an excellent job.

Thank you, Mr. Chairman.

The CHAIRMAN. Thank you, Mr. Mollohan.

I want to thank the panel for an excellent presentation. Thank you very much.

And now our final panel for the day consists of a group of experts in economic development and planning. First is Mr. Dale Hileman, Eastern District Economic Development Manager; Mr. Dan Neff, Economic Development Specialist, Ohio Mid-Eastern Governments Association; Mr. John Beck, Executive Director of the Brooke-Hancock-Jefferson Metropolitan Planning Commission; Mr. John Laslo, former Mayor of Martins Ferry in Ohio and Mr. Don Myers, Director of Development for the Belmont County Improvement Corporation

I want to welcome all you gentlemen and you pick where you want to sit yourself. We are missing Don Myers—oh, here he is. We thought we lost you, Don.

How do you want to proceed? The way I introduced you, which was Hileman, Neff, Beck, Laslo and Myers. But we can do it alphabetically or we can go from one end to the other. So why do you not make that choice.

Dale Hileman.

[The prepared statement of Mr. Olexo appears on p. 575.]

[The prepared statement of Mr. Dierkes appears on p. 486.]

[The prepared statement of Mr. Henderson appears on p. 491.]

[The prepared statement of Mr. Laughman appears on p. 544.]

TESTIMONY OF DALE HILEMAN, EASTERN DISTRICT ECONOMIC DEVELOPMENT MANAGER, COLUMBIA GAS; DAN NEFF, ECONOMIC DEVELOPMENT SPECIALIST, OHIO MID-EASTERN GOVERNMENTS ASSOCIATION; JOHN BECK, EXECUTIVE DIRECTOR, BROOKE-HANCOCK-JEFFERSON METROPOLITAN PLANNING COMMISSION; JOHN LASLO, FORMER MAYOR, MARTINS FERRY, OHIO; AND DON MYERS, DIRECTOR OF DEVELOPMENT, BELMONT COUNTY IMPROVEMENT CORP.

Mr. HILEMAN. Chairman Anderson and Committee, I too would also like to commend our Honorable Congressman Applegate for arranging for these hearings. It is certainly a pleasure and I thank you.

My name is Dale Hileman, Cambridge, Ohio. I am the District Economic Development Manager for Columbia Gas. Our District serves in 18 counties, which includes Congressman Applegate's 18th District.

If communities expect to be competitive in the economic development world, they must develop their best industrial sites or parks complete with infrastructure, fully serviced, which naturally includes water, sewer, utility, roads, bridges and rail. We have heard much about this already today. A plain, so-called "green field" will rarely attract prospective industry. I might also say that in our business, in utilities, who works very closely with the State Development Department, we do not list and make available to the State Development Department simply green fields. It takes more than that, gentlemen, it takes fully serviced land of course that is available with, as I say, infrastructure. Time constraints and known costs are a major part of the selection process.

Recently, in eastern Ohio, we formed a 13-county economic development region. All but one county included in Congressional District 18 is participating in this 13-county region.

A survey completed just last week with this 13-county region ranks infrastructure as first of three top priorities to enhance economic development growth. This perhaps addresses a question that came earlier—where does infrastructure rank. And as I say, this ranked first among the 13 counties. Infrastructure is very critical to the development of industrial parks or sites. Industrial prospect competition, as we know, is so keen today.

Permit me if you will to cite just two examples:

Currently a major federal prospect is considering locating in Carroll County. This potential facility would initially employ approximately 700 with a possibility of doubling its employment. The first major hurdle is to furnish the necessary infrastructure to service this facility. Funding must be available for this project.

Recently, a major industrial prospect even requested to locate in Guernsey County. This company proposed to initially employ around 700 to 1,000 employees. Once again, the first requirement was approximately 150 acres with the necessary infrastructure. Unfortunately this was not available, and the prospect was forced to continue looking outside this region.

The month of May unemployment figures in Guernsey County were 8.7 percent. And incidentally, they have been higher. This happens to be lower than they have been for many a month. In Monroe as well as Harrison Counties, they are in double digits. The average unemployment in the 18th District runs around 7.5 percent, of course as you know, above the national average. And they have been much higher in more recent months. We cannot afford to lose jobs because of insufficient infrastructure.

In the site selection process, potential industry is looking for reasons to eliminate a community. Eastern Ohio is not presently the hot spot for economic growth. Communities must start by having industrial sites or parks fully serviced with the infrastructure.

Let me also add that approximately 70 percent of industrial prospects are looking for good available industrial buildings, naturally including the infrastructure. Many communities in eastern Ohio do not have available industrial buildings and cannot afford to construct even a spec building. Again, if we expect to compete in the economic development world, funding must be available for industrial spec building construction with the necessary infrastructure.

I might also add that recently in Jefferson County, you may be aware that a spec building was constructed and of course the necessary infrastructure is being made available. This county, along with many other counties—I am only singling out a few of them, of the many counties that I work in—has not been that active. and our Honorable Congressman can certainly attest to that. Simply because, again, we have not had an industrial park with the necessary. This we hope, and we feel confident, will be a step in the right direction and we will now hopefully see more economic development activity as a result of this action recently taken.

Thank you again for permitting me to testify regarding the need for infrastructure and funding and its important contribution to economic development growth.

Again, I commend you for taking your time and we are glad to have you with us.

The CHAIRMAN. Thank you, Mr. Hileman.

My second one on the list here is Dan Neff, Economic Development Specialist.

Mr. NEFF. Thank you very much, Mr. Chairman, and again I would like to reiterate those comments of Dale's and thank you all for coming and showing your concern for this area of the country.

During the time allotted to me, I would briefly like to touch on three areas of concern that I have in relation to this topic of infrastructure.

The first being the importance of adequate infrastructure in the economic development process.

I think the testimony today has pointed this out, that at the heart of any local economic development plan is a need for adequate infrastructure, good highways and water and sewer systems with the capacity to handle increased loads, are often key factors in attracting new industries to an area.

Federal programs such as the Economic Development Administration and the Appalachian Regional Commission recognize this linkage and were in fact created with infrastructure development being the major priority. In my role as an Economic Development

Specialist with the Ohio Mid-Eastern Governments Association, I work with nine counties in the Appalachian region of Ohio. This has given me the opportunity to see just how effective these programs can be in providing infrastructure development that creates jobs, this being despite the drastic budget cuts that have taken place in the past decade.

Funds from these programs have been essential in creating and retaining thousands of jobs in the nine-county OMEGA district alone. These projects have included such activities as industrial park development, downtown improvements and the creation of regional shopping malls. They have not only provided the impetus for creating employment, but have also played a significant role in improving the quality of life for area residents. While we are still considered to be part of an economically distressed region, it is just painful to imagine how much worse the situation would be without programs like this.

At the state level, there is also recognition of the special infrastructure needs of Appalachian counties here in Ohio. During recent forums conducted in southeastern Ohio by Ohio Department of Development Director David Baker and Governor's Office of Appalachia Director Randy Runyon, testimony was provided by local officials, area residents and development personnel. Perhaps the most talked about issue at these meetings concerned the need for adequate infrastructure to encourage local economic development.

Secondly, I would like to touch upon the financial and technical limitations of many rural local governments.

A recent article in the New York Times examined the increasing difficulty of governing in small town America. It pointed out that many small local governments do not have the manpower, expertise or financial capability to meet the growing responsibilities placed upon them by state and federal governments.

While the Reagan Administration emphasized decentralization, it also drastically cut funding for agencies whose programmatic directives were now to be carried out by local government. In addition, the general revenue sharing was not re-enacted by Congress, thereby eliminating for many local governments their primary source of federal aid. This, coupled with increased federal and state regulatory requirements and declining tax base due to population losses have left local officials struggling to find solutions to their growing list of problems. And infrastructure is right at the top of that list, gentlemen.

A good example of this can be seen with the various health and environmental mandates being given to local governments to improve their present water and/or sewage systems. While a number of laws have been passed to improve standards—and I am all for those by the way, I think it is important that we have environmental and health quality—not nearly enough funds have been appropriated to complete the task. As a result, local governments often have to drag their feet and in doing so face severe financial penalties simply because they do not have the financial capability or expertise needed to comply.

Finally, my third area I would like to touch upon is the growing overall infrastructure crisis facing our country.

During this hearing and others like it, this Committee has heard the call from concerned citizens and public officials about the need of the federal government to do more to preserve our nation's infrastructure. Numerous studies have shown that our highways and bridges are deteriorating and that our water and sewage systems just do not meet proper standards.

While the federal government can surely not solve this problem alone, neither can it completely back away and leave it up to the state and local governments to develop policy. I urge this Committee to take the necessary steps to establish a national infrastructure priorities system and to do all it can to ensure that necessary funds are appropriated.

I would like to reiterate on Senator Burch's comments earlier and I believe a priority system should take into account economic distress factors that exist.

We all know that this problem is not simply going to go away. I think it behooves all three levels of government to re-establish and strengthen the inter-governmental linkages necessary to meet this head on in a timely fashion before the situation worsens.

In conclusion, I would like to commend this Committee for its efforts in keeping programs like ARC and EDA functioning and encourage it to do all that it can to ensure that appropriations are increased to previous funding levels. A recent report from the National Association of Development Organizations estimates that when adjusted for inflation, federal rural and economic development programs have been cut by more than 70 percent since 1980. I think this situation needs to be corrected to allow these programs to operate in the most efficient manner possible.

Finally I would just like to conclude by saying that we are all aware of the growing disparities that are existing between our rural and urban areas, economically speaking. In this area of Ohio and West Virginia, we have seen a mass exodus of people to urban areas for greater economic opportunity for them.

There is a substantial link between developing rural infrastructure to create jobs and also improve our nation's infrastructure as a whole. The more we can do to establish a strong job base here in rural America, the better off we are in promoting overall infrastructure development. The more we can do here, the less stress we place upon our urban systems. The more people that keep going to our urban areas, the greater stress is placed upon these systems. So not only are we helping to improve our rural areas but we are also helping to alleviate a major problem in our cities.

Again, thank you for this time, I appreciate it.

The CHAIRMAN. Thank you, Dan.

The third one on my list here is Mr. John Beck, Executive Director of Brooke-Hancock, Jefferson Metropolitan Planning Commission.

Mr. BECK. Good morning. Chairman Anderson, Representative Applegate, Representative Mollohan, ladies and gentlemen. I represent an interstate metropolitan transportation study. We are one of the federally mandated and also locally needed organizations that supports transportation planning.

In my larger responsibility as the Director of the Metropolitan Planning Commission, we cover a number of the facets of infrastructure that you referred to in your Committee's call for this meeting. We especially are interested in transportation funding continuing as it has. We would like to see some additional attention paid to wastewater, water supply, solid waste management and emergency avoidance and response.

We are quite concerned that the 1991 Surface Transportation Act retain many of the advantages of the present Surface Transportation Act. We would like to see one item added, which had been considered in the conference committee on the current Surface Transportation Act, but I believe rejected, and that is the possibility of river ferry substitution for optional bridges. I believe we have a river ferry situation in Brilliant, Ohio-Wellsburg, West Virginia, which would best meet the need for interstate transportation. Such an expensive bridge for so few people to cross the river would be I think an unnecessary investment for the federal government. We would like to see that opportunity inserted in the new Transportation Act, as I believe it was written in the Senate version of the bill previously.

We are also very strongly concerned that all of the transportation trust funds come off of the federal consolidated budget. Those transportation trust funds are extremely limited by that budget circumstance. We, in Jefferson County—and I speak here for the Board of Commissioners, have an application pending with the Federal Aviation Administration for a small airfield called Jefferson County Air Park. That $1.7 million piece of what we see as a $10 million investment in this small airport would make an impressive investment as a reliever airport for the currently pressed Greater Pittsburgh International Airport. It would serve all three of our counties; Brooke, Hancock in West Virginia and Jefferson in Ohio as an access point to the air system.

By the way, Dale, I do not mean to correct, but that spec building that the Jefferson Economic Development Council was considering is just at the bid stage now and it is to be located at the Jefferson Air Park. We are looking for some assistance with water and sewer infrastructure to that site and we have been working with the folks at the Ohio Mid-Eastern Governments Association for some time. We are hoping to see the Appalachian Commission and the Economic Development Administration involved in that infrastructure investment.

I would like to echo Mayor Bowman's call for U.S. DOT funding for the remaining West Virginia, actually Weirton, project for the U.S. Route 22 bypass. We would like to express our pleasure with the U.S. DOT/Ohio Department of Transportation cooperative effort for this most recent bid approval. I believe they let into the area of $86 million worth of projects last week for the bypass, and that one remaining project, plus I believe Congressman Applegate's reference to what we call the Findlay development connector, would complete our access to the airport. That connector runs from the McDonald exit on U.S. 22 to the southern expressway, which you gentlemen considered in the last Transportation Act as necessary linkage to the Allegheny County portion of the service area of that airport.

I do not want to belabor transportation to the exclusion of the other infrastructure problems. My basic concern with all of these problems is that you take a common approach. We feel that planning, involving the local governments, the state governments and federal representatives is most critical.

Secondly, we feel that a system of funding which makes the lager investments possible, is a critical need. And only the federal government with its taxing capacity and with its ability to focus these infrastructure investments will be able to make possible this cooperative approach.

We ask that the Committee give strong consideration to all the areas of infrastructure need, and we would be willing to answer questions or respond to you in the future, as you may need.

Thank you, gentlemen.

The CHAIRMAN. Thank you, Mr. Beck.

My fourth one on the list here is Mr. John Laslo, former Mayor of Martins Ferry, Ohio.

Mr. LASLO. Thank you very much, sir.

Mr. Chairman, Congressman Applegate, Congressman Mollohan, we want to thank you in behalf of our Committee for permitting us to present our problems and our project to your attention.

I first became acquainted with the Short Creek Valley highway program in 1963, so it is a long-standing project that we have been working with. And what had happened, the riverfront industries, business places, became involved along with the Short Creek Valley business people and the officials of the various communities that are in that area. This highway is intended for a location south of Cadiz, about 17 miles down through the Short Creek Valley, bypassing Adena, Dillonvale and the small towns in the area, and reaching Route 7 at Rayland on the Ohio River.

I might tell you that in 1971, the ODOT people authorized a location study and they employed Rackoff Associates to do it. There were some problems with it when it was presented to the federal highway people and they found some things that needed to be changed and done. The State Department of Transportation, because of funding restraints, and the monies had run out when they hired—after the location study was made by Rackoff Associates, decided that they would do the necessary changes to satisfy the federal highway people themselves.

I might tell you that construction of the Short Creek Valley highway will (1) provide a highway for general traffic which has been needed for many, many years. And secondly, it will provide the impetus for industrial development, also much needed in southern Jefferson County and eastern Ohio. There are potential industrial sites in the Short Creek Valley which are rated excellent.

Mr. Chairman, what I would like to do is touch briefly on my report. I have been told it has been—it will be recorded as a result of the meeting, but some of the points that have been brought up in this meeting today, such as population decline and the needs of our business people and industrial people, I would like to briefly touch on, to reports that have been generated and given to me in the past.

The Jefferson County industrial park site survey prepared by the Jefferson County Regional Planning Commission and financed by a grant from the Appalachian Regional Commission, pointed out the top ten industrial park sites and 25 additional sites. Four of the top ten are located in the Short Creek Valley area and of the remaining sites pointed out, several are close by. The survey is a good one and points out that good transportation plays an important role in regional economic development.

People in the Short Creek Valley are trying and working hard to revitalize the area. You heard a little bit today about the flooding conditions we have had in the past several weeks. The Short Creek watershed program is moving ahead. This project is meant to help control flooding in the area and will also provide additional economic development land area available to provide jobs.

Much of our eastern Ohio area is a depressed area. We were basically a coal and steel area. In District 6 of the United Mine Workers of America, on January 1, 1977, we had 16,018 miners actively employed. As of April 1, 1989, 4,040 miners are working. We have lost that many mining jobs.

In District 23 of the United Steel Workers of America, in 1970 we had 33,000 steelworkers employed; in 1989, 26,000 steel workers are employed.

The following appeared in a local newspaper: "Harrison County ranked third among Ohio's 88 counties in the percentage of residents living below the poverty level in 1988." Harrison County's poverty level is 29.4 percent.

Most east Ohio counties rank in the top 25 in poverty rates among the state's 88 counties in 1988.

Belmont County ranks 23rd with 19.1 percent, Jefferson County is 21st with 19.9 percent.

I have an endorsement here for the highway from District 23 of the Steelworkers of America and it is signed by Jim Bowen, the Director of District 23. One paragraph says, "The United Steelworkers of America has lost thousands of members in this valley and I feel that this transportation improvement would greatly enhance the area by improving present businesses and attracting new businesses. Our Union wholeheartedly endorses this project and urges those who can make it become reality to do so as soon as possible."

Wheeling Pittsburgh Steel Corporation today is the largest employer in the northern Ohio Valley. I have received an endorsement from Wheeling Pitt and they tell us why they feel we should have a highway in the Short Creek Valley. "We have reviewed the possible effects that this construction would have on the transportation of products to and from our Ohio plants via motor carrier." The plants are of course at Steubenville, at Mingo, at Yorkville and Martins Ferry. A big part of the Wheeling Pittsburgh Steel's employment are in those plants. "It appears that the effects would all be positive for our corporation. The potential benefits are discussed below. Motor carrier operating costs would be reduced on steel shipments to our customers in northern Ohio, northern Illinois, northern Indiana and in the states of Iowa, Michigan, Nebraska, Minnesota and Wisconsin. On a monthly basis we estimate that there would be 2,600 truckload shipments of steel that would take advantage of the proposed new highway, and on inbound material we estimate that about 100 truckloads a month would take advantage of the proposed highway."

We have received an endorsement from the Eastern Ohio Regional Hospital also. It states "I am writing to indicate Eastern Ohio

Regional Hospital's support for the construction of a new federal highway between Cadiz and Rayland and extending through the Short Creek Valley in Jefferson County and connecting with State Route 7 at the Ohio River in Rayland. As a major provider of health care in southeastern Ohio, we consider it of vital importance to have an excellent highway network to transfer emergency patients to our facility. Also, as a major employer, we consider this project to be of vital importance to the economic development in this region." The hospital is located in Martins Ferry, Ohio.

We have an endorsement and a request from United Dairy which is located in the Ohio Valley, and it is signed by President Joseph Carson.

We have an endorsement from Nickles Bakery which travels all over the eastern Ohio area. They of course feel it would be certainly inducive and very helpful to the operation of their bakery.

I would like to talk to you just briefly about the school system people also, who are very much interested in this inasmuch as the new high school built in the Short Creek Valley that will handle better than 1,000 citizens. The Superintendent of Schools in one paragraph states "My concern rests with the safe transportation of our children to the new high school. We desperately need a modern updated highway into the new Buckeye Local High School. As well as busing a thousand students to and from this school daily, we will have continuous runs traveling Route 150."

We have also an endorsement for the Superintendent of Jefferson County Schools, Craig Closser, which in one paragraph says:

> Declining enrollment in the school district, because of the high unemployment in the region, has had a serious effect on the quality of education. This critical problem can be curbed with an improved highway which undoubtedly will stimulate economic development. With an expanding economic base, the region will experience a stemming of the out-migration of young people.

Local mayors continue to push for new highway. The entire Eastern Ohio Mayors Association approved this because of the help it would give business and industry along with their on general traffic in getting to northern Ohio.

We talked about—Congressman Applegate mentioned population loss. Here are projections for southern Ohio County population projections for the years from 1985 to 2010. I would like to point out to you that in Belmont County in 1985, we had a population of 81,553; 2010 going down to about—in that five year projection, it will decrease, they say to 71,768.

Harrison County in 1985 they had a population of 16,249; by 2010 it will have a population of 9836.

Jefferson County a population of 87,012 in 1985; will decrease if present things go on as they are, to 68,018.

"According to the Ohio Department of Employment Services, Eastern Ohio, the counties of Belmont, Jefferson, Harrison and Monroe suffered a major decline in population between November and December. The state estimate of population decline in the area is bad enough, but when the statistics indicate that most of those no longer in the local labor force had been recorded as employed in the November estimates," then we have a problem.

I want to extend the appreciation of our committee along with the business people in the Ohio Valley who are tremendously in support of this program. There is more information in here that is more explanatory of why the people are working so hard to get this done.

I have turned over to Mr. Jim Hart also a listing of all of the companies, the corporations, the unions, the people, the business houses on the riverfront, all who are working toward the construction of this highway.

I want to tell you too that we would appreciate very much one of the first steps to be taken that funding be supplied to take care of the corrections in the original planning of this project that was completed in 1975 so that we can go ahead and continue working. We have a depressed area, we want to do something about it.

Thank you very much for permitting me to be here today.

Mr. APPLEGATE. Thank you very much, John.

We saved the sort of icing on the cake, is that it? We have Mr. Don Myers, Director of Development, Belmont County Improvement Corporation.

Mr. MYERS. Congressman Applegate, Congressman Mollohan, recently our office compiled a list of infrastructure needs for Belmont County. That list exceeded $175 million, the completion of State Route 7 through Bellaire, Ohio requires $70 million. Our county has 78,200 people and nearly half are without sewerage and nearly 25 percent without adequate water supply.

It is difficult to speak of new development of infrastructure when much of existing infrastructure is in such need of repair.

Our largest industry within Belmont County is Wheeling Pittsburgh Steel, which employs over 600 people. This industry, located in Martins Ferry, Ohio, uses nearly 25 million gallons of water monthly. The water lines that feed that industry are nearly 80 years old. Average unemployment in the 18th District is 7.5 percent. We cannot afford to lose existing jobs because of insufficient existing infrastructure. If we expect to compete in the global world, we must have federal funds for infrastructure.

On December 21, 1987, the Belmont County Commissioners purchased 158 acres of land, 400 yards north of Interstate 70 for the purpose of developing an industrial park. During the past two and a half years, five potential developers have looked at the site and all have said no because the site lacks water, sewer and roadway into the park. Very few counties have the financial resources to develop green fields. Federal programs must be available if this industrial park is to succeed.

The federal government has drastically reduced the amount of money available for economic development projects. Programs such as UDAG, ARC, EDA and Farmers Home have either been eliminated or greatly reduced. The federalism program has put financial strain on both state and local governments. It is my honest feeling that this Public Works and Transportation Committee under the direction of Chairman Glenn Anderson plays the most important role to economic development growth and recovery.

Congressman Applegate, Congressman Mollohan, nobody knows our plight better than you, and we appreciate your concerns and look forward to working with you in the future.

Thank you.

The CHAIRMAN. I might start off with my first question. My question to this panel are what are the most critical capital investment needs for this area of the state, or for your area—you can do it any way you wish.

Mr. BECK. Transportation, sir. I think the critical need is transportation access. Probably second in line would be wastewater solutions. We have been very lucky with our water supply. It is coming to a cusp point though as we begin to dispose of some of our wastewater in some of the ways we have done in the past 100 years, we have damaged some of our underground water supply. We are soon going to have to have an effort in water supply as well. I think in that order. We will solve the solid waste problem here and perhaps for some of the surrounding communities of Ohio as well. And I think the emergency problems, the flood relationships, are going to be handled in the future. But I really think that transportation is the critical need.

Mr. LASLO. I agree with that, Mr. Chairman. I know there are hundreds and hundreds of acres of available land in the Short Creek Valley area along that—and of course, on the riverfront where the Short Creek Valley roadway ends, there are thousands of acres there. Most of the market area for the people that are manufacturing on the Ohio River industrial area, market areas in northern Ohio, and as I mentioned, in northern Illinois, northern Iowa and Minnesota and those areas. The monies that they can save through manpower, through oil and gas, whatever it takes to run their finished products into those market areas means a lot to them to survive.

We have, of course at one time, and I mentioned and Don mentioned briefly, on what the Wheeling Pittsburgh Steel, which is the largest employer in our area, employed let us say 10–15 years ago—at the present time they are in bankruptcy, they had financial problems, but they soon will be out of it and they are doing very, very well. But we want to keep them in business and get back to the amount of people that they once employed. They once employed 13,000 people in all of their plants, they are down between six and seven thousand right now.

We have lost some businesses, Tacoma Industries moved out of our area, Eastern Paying is done, we have lost any number of industries because of cost.

Transportation is our main problem and this highway means something to all of the people on the riverfront; the chambers of commerce, the boards of trade, all are hollering for a new highway from the riverfront on up into the northern part of the state and that is the Short Creek Valley area, the shortest route.

Thank you very much.

Mr. MYERS. Mr. Chairman, Belmont County is most fortunate, it has Interstate 70 that divides our county, State Route 7 will be soon completed and State Route 250, and both the state and federal government basically take excellent care of these three major arteries. Belmont County, believe me, with 50 percent of the people without sewerage and 25 percent without adequate water supply, that remains our basic infrastructure need.

The CHAIRMAN. Mr. Neff.

Mr. NEFF. Yes. I would just like to agree with the comments that have been expressed so far during the questioning session. And too, I think the major problems are transportation and water and wastewater needs.

This area, we do have Interstates 70 and 77 nearby, they are a blessing to us and we are very fortunate to have them. However, because of the topography that exists in this part of the country, aside from a few other vital routes that have been mentioned, there is very limited access to a lot of our areas and as a result, it is difficult for job creation.

Again, with water and wastewater needs, we have significant ones. It was pointed out in the Newtown area because of the flooding, the problems that they have, Adena and Dillonvale because of the flooding, problems that have existed there, as well as numerous other areas that maybe have not been flooded but still have drastic needs in this area.

I think this points out the limitations that many small rural local governments have in funding these type of projects, they just do not have the tax base, they are losing population and all it does is exacerbate the situation even further and again, I would like to point out that programs like EDA and ARC are essential for these local governments to be able to fund these type of projects.

Thank you.

The CHAIRMAN. Mr. Hileman.

Mr. HILEMAN. Mr. Chairman, you have probably heard it said there are three factors that greatly influence a prospect and that is location, location, location.

I think what has been said here today in response to your question, I would agree that overall in Congressman Applegate's District, transportation is the factor largely influencing the location. And there are some areas that you cannot get there from here. And so obviously that is a factor. Look at southern Ohio, what has been accomplished. I think that will point out what can be done.

So I would say overall, I would agree that transportation would probably be number one. However, as was also pointed out, in some counties we are blessed with highways. I happen to be in one—live in one, although I work in 18 counties, that is the crossroads, and that is not necessarily the major factor, but certainly wastewater I think would come in probably number two, if you were to rank them.

Thank you.

The CHAIRMAN. Thank you, Mr. Hileman. That covers everybody I believe.

Mr. Applegate, would you like to——

Mr. APPLEGATE. Well I again would like to thank the panel. This is the final panel. The information that we have received today by all who have been here has just been most invaluable. Because you people are the experts, you know all the local intricacies, you know exactly what it is that we need to make our area move and you have to try to exert all the influence and pressure that you can upon those who hold these elective offices.

We are here to listen and of course you know my feelings and where I am, but we have of course 435 other members of the Congress and 100 members in the Senate, so we have all of those individuals that we have to deal with, many of whom are clamoring for monies for problem areas that are much parallel with ours.

I would say this, that yes, I agree that transportation is of a critical nature. Some of those transportation needs are now being met in eastern Ohio. However, we have gotten so far behind over the years, that we still have need for additional improvements to our highway system in order to help to bring in new economic development and new jobs. But just as critical, I think was pointed out by Don Myers, and I think he used the example of the industrial park which is off of Interstate 70 and an excellent location and all, but he has lost four investors into that because of the fact that there is not any adequate sewer and water and they do not have the ability to be able to put that in. That too of course is very critical, and I think as Dan has pointed out how critical it is from not only an economic development point of view, but also because of sanitary or health-wise, in the smaller areas who cannot afford to be able to put in sewer and water areas in places like Dillonvale and Adena, Newtown and Dunglen and all those little smaller communities who have been hit hard by the flash flooding and who now cannot drink water in a lot of these areas and who come into the central location in Dillonvale, Ohio. I sat there the other day and watched people come in to pick up their two gallons of water, because it is contaminated and they just cannot drink it.

In this day and age, we are moving into the 1990s, with all the scientific knowledge, and what is it they always say, gee we can send a man to the moon but we cannot have clean water. And it is true too, we send pictures through the air to television sets and all that, but here we are, we are depriving so many of our needed areas who simply cannot afford it—we are depriving them of what every community should expect.

Certainly I think that is the direction in which we are going. And I think John Laslo pointed it out very succinctly, that over the years, we are going to be losing so much of our population because our young people are leaving and so we are left with a lot of older people, our senior citizens, who have worked to help to try to develop the area but now they do not have the funds to be able to keep up the tax base.

We need the economic development, we need the jobs, we need to keep our young people here. When I go into the schools, I go in to talk to them about how great it is to stay here and to help your community, and it is a pretty hard sell when they are looking to all these lush areas and wonderful places like California and areas like that where they all want to go. And when I was a young fellow too, Mr. Chairman, that was my dream, to go to California. But I stayed here and I am very happy for that.

But I just appreciate very much the fact that you are all here to point out to the Committee, and of course all of your testimony will be a part of the record and will be looked at. We will be looking at these things next year and hopefully we will be able to come up with something that will be constructive, that will be able to help alleviate some of the problems that we have here, and move forward into the 1990s.

The CHAIRMAN. Mr. Mollohan.

Mr. **Mollohan**. Mr. Chairman, I want to thank you and Congressman Applegate again for inviting me to participate in this hearing and for coming to our area to hold it.

While it has focused on eastern Ohio, you have very graciously allowed representatives from West Virginia to participate, the excellent testimony of Mayor Bowman and the excellent testimony of John Beck, who has responsibilities on both sides of the river, and I appreciate his being here and his contribution.

Infrastructure is a sleeping giant in this nation, and for you to come here and look at the specific needs of this area is very reassuring as this nation must, I think, begin to build roads, water and sewer projects, airports, and to do the infrastructure things necessary as these people know, almost better than anybody, for good economic development.

So again, thank you very much for allowing me to participate and I appreciate the testimony of all these excellent witnesses on every panel.

The **Chairman**. Thank you, Congressman Mollohan.

Mr. **Applegate**. Thank you very much, Al. And if I just may add, I want to just take a moment just to thank Glenn Anderson, the Chairman of the Public Works Committee, for his willingness to bring the Committee here, to bring the staff in. I certainly want to give my thanks to Alan Mollohan, my good friend and colleague from West Virginia for coming over and participating in this.

And let me just say that anybody that looks at the Committee and says well gee, you have a big committee and this is all you have—that does not make any difference. This is for the record. It is nice to have a whole roomful of all of the members of the Public Works Committee, but that is not the most important thing. The most important thing is that we will be able to review the testimony and the fact that the Chairman of the Committee is here, I think is very critical to what it is that we are trying to accomplish.

So I again want to thank you and your very, very able and capable staff and Alan Mollohan, and also my staff, who are here too.

Thank you.

Mr. **Laslo**. Mr. Chairman, on behalf of the people of the Ohio Valley and Martins Ferry in particular where I served for 24 years as Mayor, I want to express our appreciation——

The **Chairman**. How many years?

Mr. **Laslo**. Twenty-four.

The **Chairman**. Twenty-four. You did better than I. I was thinking well he is a former mayor, I am a former mayor. I was mayor for—elected for four years but that was in 1940, which is over 50 years ago, and I think in my third year they elected me to the legislature, so I had to resign as mayor to go to the legislature. I was there for many years, 10–12 years I think, and resigned there to become Lieutenant Governor and left there to become Congressman. This is my 51st year in government.

Mr. **Laslo**. Beautiful. Well I had ten years in council as president of the council or councilman-at-large, then 24 years as mayor and I figured that was enough.

The **Chairman**. That is a long time.

Mr. LASLO. But Congressman Applegate was very helpful to the city and to the Valley and to his District and we certainly appreciated that very much. A number of times I called on Congressman Mollohan when we were in programs that covered more than just the city, and we appreciated your help. But California, I always wanted to move back there. You know, I founded Colt League baseball and we had our world series in Ontario in 1957, 1958, 1959 and 1960. And I loved the place. They offered me a job there and I could run the program from there. But my wife would not move. So I stayed in Martins Ferry.

The CHAIRMAN. I will not comment on that.

Well, I will say as we conclude this hearing that we first of all thank Congressman Mollohan for taking time from his busy schedule to be here today and I want you to know a little bit about who is up here. Doug Applegate and I are on the same Public Works Committee and we are involved at different times—often I think we are in the most important Committee in the Congress, but there is another time that I think that the Committee that Mollohan is on is even more important, that is the Appropriations Committee, because when we do something, then we have got to get some money to do it and we have to go to his Committee. So you have got two very important guys here and I think you ought to be aware of that.

Mr. MOLLOHAN. Mr. Chairman, may I just interject there if the Chairman will yield?

The CHAIRMAN. Sure can.

Mr. MOLLOHAN. I think the importance is evidenced by my prayer to you five years ago to please make this Weirton bypass a primary priority and you agreed with it. I think that represents where the real power is. Thank you.

The CHAIRMAN. Well thank you. Remember that the next time I come asking for money. [Laughter.]

Also let me thank Jim Hart and Anne Grady of Congressman Applegate's staff and all the people of the 18th Congressional District for their hard work and hospitality in helping put this on.

And lastly and most importantly, I want to thank Doug Applegate for his commitment to infrastructure, both in Ohio and the Nation as a whole. And Doug, I want to say that when we get back to Washington, I look forward to working with you on two important issues; first on the clean air bill and your efforts on behalf of the Ormet Plant. Did I pronounce it right?

Mr. APPLEGATE. Yes.

The CHAIRMAN. And second, on the hazardous materials transportation, which is very important and of special concern to your district. Everyone here should know that Doug Applegate has been the champion in Congress on that issue.

In all, this has been a very informative hearing and I want to thank everybody for participating. And I am very pleased to have been here.

With that, the Committee is adjourned. Thank you very, very much.

[Whereupon, at 12:04 p.m., the Committee was adjourned.]

[The prepared statement of Mr. Hileman appears on p. 495.]
[The prepared statement of Mr. Neff appears on p. 553.]
[The prepared statement of Mr. Beck appears on p. 475.]
[The prepared statement of Mr. Laslo appears on p. 505.]
[The prepared statement of Mr. Myers appears on p. 550.]

STATEMENT

OF

JOHN R. BECK

EXECUTIVE DIRECTOR

BROOKE-HANCOCK-JEFFERSON METROPOLITAN PLANNING COMMISSION

to the

Subcommittee of the

Committee on Public Works and Transportation

United States House of Representatives

July 16, 1990

Mr. Chairman, Members of Congress, Ladies and Gentlemen: The Brooke-Hancock-Jefferson Metropolitan Planning Commission, an interstate organization created in 1969 by local governments, serves the Steubenville, Ohio-Weirton, West Virginia Metropolitan Area. We plan for all facets of government service, but we concentrate our planning on the most serious problem--the infrastructure of our own region.

We plan for transportation systems of all modes, water systems, wastewater systems, solid waste management systems, fire and other disaster response systems, and many more. Where possible, we focus funding for new and rehabilitated systems on user fees. In the case of Ohio, we assist local governments in their competition for newly-available Issue 2 Infrastructure funding.

We help our members compete for the bare remnants of formerly very successful U.S. Environmental Protection Agency §202 Wastewater Facilities grants. For eligible areas and populations, we assist with requests for U.S. Dept. of Housing and Urban Development Community Development Block Grants. These stripped skeletons of former Federal infrastructure programs still do what little they can to help our member local governments meet relatively smaller infrastructure investment needs.

Last week in our region, the U.S. Department of Transportation made possible the Ohio Department of Transportation's awarding the last two U.S. Route 22 bypass contracts for a total of $86.6 million. Hopefully, the last contract in West Virginia for a project worth over $35 million will be let soon. Regardless of when, such massive expenditures for vitally needed public works can be made only through a partnership which mobilizes Federal, State and local resources.

We urge you to retain that partnership in the surface Transportation Act of 1991. The combination of metropolitan area-wide, locally-based planning with State DOT administration and funding and U.S.D.O.T. standard-setting and funding, has worked extremely well in the transportation field. We hope to see its scope expanded rather than limited to some impossible to define Highway System of National Significance. We also urge you to restore the former U.S.E.P.A./State E.P.A./Local Government cooperative effort for wastewater infrastructure, and to broaden its scope to include water supply, solid waste management and emergency response systems.

Many of these systems now contain individual infrastructure projects which rival the transportation system in their need for large investments. Only the Federal government of the United States of America can mobilize such a massive infrastructure creation and rehabilitation effort. Only your Committee in the House of Representatives can begin the necessary authorization and appropriation actions to begin the effort.

We will assist you as we support our state and local governments in planning to ensure coordination, non-duplication and cost-effectiveness of infrastructure investments. Please make this important legislation a high priority during the Second Session of the 101st Congress.

* * *

If you have any questions or comments, I would be pleased to respond.

Sincerely,

John R. Beck

St. Clairsville, Ohio

July 16, 1990

Members of the Committee, I thank you, and I especially thank our Congressman Doug Applegate, for your willingness to come to Eastern Ohio to discuss the issue of infrastructure in general and to listen to state and local perspectives on the critical role the federal [illegible] effectively through the 1990s and into the 21st century.

My name is Robert Burch, and I live in Dover, Ohio (Tuscarawas County). I serve as an Ohio State Senator representing the 330,000 residents of Carroll, Columbiana, Harrison, Jefferson, and Tuscarawas counties, and I speak from the perspective of our State of Ohio in general and our needs in Eastern Ohio in particular.

Infrastructure--our highways, bridges, railroads, airports, ports, mass transit, solid waste disposal facilities, sewers, and waste treatment facilities--these are the systems that serve as the lifelines of modern society. They allow modern society to function effectively when adequately maintained, and the critical importance of this subject cannot be overemphasized.

You are well aware of the magnitude of our infrastructure needs as a nation. Estimates of necessary national infrastructure repair and replacement costs exceed $2 trillion. From an Ohio perspective, studies show that more than $2 billion must be invested in Ohio infrastructure to achieve the standards of quality that we must set for ourselves as a state.

Historically, Eastern Ohio has been one of the primary industrial engines that built the United States into the greatest economic power in history. Unfortunately, the last decade has been an economic disaster for Eastern Ohio, and we have not shared fully in the economic recovery that we have seen in other parts of our State and our country.

Speaking parochially, as an Eastern Ohio elected official, we need specific, targeted assistance from both federal and state government in many areas, and assistance with infrastructure development is perhaps the most important of these areas. There is no greater economic development tool than a well-placed highway, and railroads, airports, sewage systems, and waste treatment facilities are the building blocks of economic development.

Until recently, as in many other areas of public policy, we have had a federal/state/local partnership in the area of infrastructure construction and maintenance. Unfortunately, the decade of the 1980s has seen an accelerated federal withdrawal from this historic partnership as federal funding levels were cut significantly in one public works area after another. If we are to adequately respond to the crisis of our eroding infrastructure, the federal government must reclaim its role as a full partner with state and local government in jointly identifying and meeting our infrastructure needs. Most importantly, the federal government must put its money where its mouth is, and move to restore its traditional funding levels and percentages of funding participation in almost all areas of public works and infrastructure development.

Perhaps more than any other state, we in Ohio have done our share to plan and budget for our future infrastructure needs and to raise the dollars necessary to make our plans a reality. It has not been easy. First, in 1983, Ohio raised taxes to balance our budget and get our economic house in order, thereby providing a stable foundation for the future. Second, the Ohio General Assembly raised state gas taxes twice in the past 4 years, with an increased percentage of these funds going to local government, and we have provided local government with the ability to significantly increase their license plate revenue as well. As a result, we in Ohio have begun one of the most aggressive, and expensive, highway and bridge construction and maintenance programs in the country. Third, in 1987, Ohio voters overwhelmingly approved Issue 2, a constitutional amendment that authorized a $1.2 billion, ten-year program of infrastructure construction, repair, and replacement. We are now beginning the third year of this program, and I am unaware of any other state which has an infrastructure program comparable in either sheer size or in its exclusive focus on local government projects and priorities. In addition, we in Ohio have put in place a number of other funding mechanisms to provide for infrastructure development, particularly in the area of environmental protection, such as solid waste disposal facilities, waste water treatment facilities, and other water and sewer projects.

We in Ohio are doing our part, but we need the full participation of our federal partners if we are to accomplish the job that must be done.

Having outlined our Ohio accomplishments and my recommendation for full federal partnership in general, let me briefly state two specific areas where tough federal decision-making and realistic action at the federal level would be helpful to us in Ohio.

First, take action to address the federal budget deficit crisis which threatens our economic future as a nation. Decisive action in this regard will not only benefit and strengthen our country in the long run. In the short run, action to balance our federal budget should permit release of the tens of billions of dollars currently sitting idle in the highway and airport and other trust funds which, to some degree, are not being released in order to artificially mask the true size of our federal budget deficit. I assure you these funds are critically needed and will be well spent.

Second, where appropriate, take into consideration the economic distress of the region or State in determining where limited federal infrastructure dollars should be directed and the manner in which those dollars are made available. As I mentioned, we in Eastern Ohio need specific, targeted assistance, and this assistance should be in the form of grants or low interest loans, rather than market rate loans, where the project involves a political subdivision with significantly higher than average unemployment or poverty levels.

In conclusion, in Eastern Ohio, economic development and job creation must be our top priority, and infrastructure construction, repair, and maintenance is a critical factor in achieving our goal of economic development success. I appreciate the opportunity to share these thoughts with you. I look forward to working closely with your Committee and others as, I am hopeful, we move aggressively toward the full partnership with the federal government which we need if we are to advance and complete effectively into the 21st century. Thank you.

INFRASTRUCTURE: PROBLEMS AND NEEDS

JACK CERA, STATE REPRESENTATIVE
99TH HOUSE DISTRICT
BELMONT, MONROE, AND NOBLE COUNTIES

INFRASTRUCTURE: PROBLEMS AND NEEDS

I. OVERVIEW

The problems facing our infrastructure are great. The funding needs outweigh the amount of dollars available to address these needs. Ohio voters, by passing Issue II, have made a 10-year (over one-billion dollar) commitment to address infrastructure needs. However, this funding will fall way short of addressing all of the highway, bridge, water and sewer improvements needed around Ohio. The Ohio Legislature, by passing an increase in the gasoline tax, has provided additional funding to deal with state highway and bridge needs. The funding also helps local governments. Despite the increase funding for infrastructure in Ohio, many needs are not being addressed.

During the past years, many problems have been brought forward by constituents and various governmental bodies. I would like to point out some of these problems and possible solutions.

A. WATER

There are basically three areas which need attention in order to provide adequate water services to our citizens. First, is the need for an adequate water supply. Many communities have faced problems with their supply of water. Problems with reservoirs have lead to water shortage problems, especially for communities not located on the Ohio River. While some money has been secured for repairs to existing reservoirs, funding for development of new reservoirs is harder to acquire. While for some communities water sources are a problem, the most serious problem is the water delivery system.

Many communities have very old water lines which often break and require continual repair. Also, many of the existing lines cannot carry the volume of water necessary to service all residences adequately. Replacement of these lines are able to be funded through Issue II which will help, although again, there is a limit to the amount of funding available through that program.

Another problem exists in the area of new water line extensions. This is especially true in rural areas. Issue II money can only be used for existing systems and not to extend new lines. Many of us believe this is wrong and support H.B. 543 sponsored by Representative Tom Johnson which would allow Issue II money to be used to extend lines in the Appalachian counties in Ohio. While this bill has passed the House of Representatives, it has stalled in Senate committee. Therefore, counties trying to extend water lines still must rely on Farmers Home money to fund these projects. The biggest problem with this source is that in many areas where water lines are needed, the population is small, making the cost per customer too high for the project to be accepted. Often water lines are extended to within short distances of homes leaving some people high and dry while their neighbors enjoy the benefits of being on a public water system. Funding is needed to extend these lines the extra distance. We must continue to work for passage of H.B. 543 as a solution to this problem. While many people, especially in urban areas, may take public water for granted, it is absurd in 1990 that many rural Ohioans have to rely on wells and springs for water.

B. SEWER SYSTEMS

Many communities are facing the difficult task of upgrading their sewerage system and treatment facilities. The federal and state E.P.A. requirements have placed a severe financial burden on small communities and their citizens. The costs of these improvements are seldom under $1 million and the small population base in these communities mean that these high costs are spread over very few people. If a larger city has improvements to be made at least their cost are spread over more people reducing the financial burden on each individual. Communities which are required to make these improvements are faced with businesses closing and people leaving because of the increases in sewer and water fees.

The other problem with sewerage is acquiring funding for sewerage to attract business. I am sure that others will testify on this. Therefore, I will not take time to pursue this.

C. HIGHWAYS AND BRIDGES

Funding needs for state and local highways and bridges are still out of our reach even though the legislature has raised the state gas tax. The increase has permitted us to make some strides in our maintenance program and start new construction projects. It has also given additional money to local governments. Still, more money is needed, especially for bridge replacement and for rural townships which have many unimproved roads.

The President's proposal to place the burden of transportation improvement costs on the state is absurd. As I said, we already have increased our gas tax and I do not believe we will be able to pass further increases. What we need is for the federal government to release our gas tax money which is held in the Highway Trust Fund. It is my understanding that Ohio has between $300-$400 million of our money which has not been released. This money is being used to help mask the federal deficit and that is wrong. Finally, any proposal to raise the federal gas tax should give us assurances that this money is used for highway and bridge construction and repair and not to reduce the federal deficit. This tax is a user fee and should be used for repair of our transportation system. The gas tax should fix the holes in our roads not the holes in the federal budget.

TESTIMONY OF MONROE COUNTY COMMISSION PRESIDENT, MR. GLENN DIERKES
PUBLIC WORKS AND TRANSPORTATION COMMITTEE
HEARING ON INFRASTRUCTURE
MONDAY, JULY 16, 1990 ST, CLAIRSVILLE, OHIO

IT IS A TRUE PLEASURE TO HAVE THE OPPORTUNITY TO ADDRESS THIS COMMITTEE IN REGARDS TO INFRASTRUCTURE NEEDS OF MONROE COUNTY, OHIO AND THE SURROUNDING AREA.

IN MANY RESPECTS, THE INFRASTRUCTURE ISSUE HAS BEEN DISCUSSED, DISCUSSED, AND DISCUSSED. IN THE PAST FIVE YEARS A VARIETY OF GROUPS INCLUDING THE OHIO RIVERFRONT REDEVELOPMENT TASK FORCE, THE APPALACHIAN TASK FORCE, BUCKEYE HILLS-HOCKING VALLEY REGIONAL DEVELOPMENT DISTRICT AND OTHERS HAVE ISSUED REPORTS OUTLINING STEPS NEEDED TO REVITALIZE THE SOUTHEASTERN OHIO AREA. THESE PLANS AND REPORTS ARE READILY AVAILABLE AND SHOULD BE VIEWED TO SUPPLIMENT MY REMARKS.

MOST PROFESSIONALS CONSIDER ECONOMIC DEVELOPMENT TO BE DRIVEN BY INFRASTRUCTURE (OR THE LACK OF IT). A PARTICULAR COUNTY MAY BE DOING QUITE WELL, ITS NEIGHBORS MAY BE SUFFERING. MONROE COUNTY HAS BEEN SUFFERING FOR MANY YEARS. THE MOST RECENT ANNUAL AVERAGES PROVIDED BY THE OHIO BUREAU OF EMPLOYMENT SERVICES (1989) SHOWS MONROE COUNTY, OHIO TO HAVE THE HIGHEST UNEMPLOYMENT RATE IN THE STATE AT 11.3%. EQUALLY IMPORTANT IS THE FACT THAT THE COUNTY HAS LOST ALMOST 20% OF ITS WORKFORCE IN THE PAST FIVE YEARS AND THAT THE COUNTY IS PROJECTED TO LOSE GREATER THAN 10% OF ITS POPULATION BETWEEN 1980 AND THE CURRENT CENSUS.

TRANSPORTATION

WITHIN MONROE COUNTY THERE REMAINS A CRITICAL NEED FOR HIGHWAY IMPROVEMENTS. MONROE COUNTY HAS NO FEDERAL HIGHWAYS

WITHIN ITS BOUNDARIES. MONROE COUNTY DOES HAVE APPROXIMATELY 200 MILES OF STATE HIGHWAYS, 375 MILES OF COUNTY HIGHWAYS, AND 541 MILES OF TOWNSHIP ROADS. BASED ON A MEASUREMENT SUCH AS VEHICLE MILES PER HIGHWAY, DOUBTLESSLY, THE STATE ROADS ARE IN THE BEST CONDITION, THE TOWNSHIP ROADS, THE WORST. NO ACCURATE ESTIMATE OF COSTS NECESSARY TO REPAIR THE TOWNSHIP ROAD SYSTEM IS AVAILABLE. MOST OF THIS SYSTEM IS GRAVEL SURFACE. ANY SURFACE TREATMENT OF THIS SYSTEM IS LIKELY TO BE SHORT LIVED. PROBABLY LESS THAN 10% OF THE TOWNSHIP ROAD SYSTEM IS ASPHALT. SOME FUNDS HAVE BEEN AVAILABLE FROM THE COUNTY BUDGET TO ENGAGE IN A PAVING PROGRAM FOR THE PAST THREE SUMMERS. APPROXIMATELY 25 MILES OF COUNTY ROAD HAS BEEN PAVED ANNUALLY. IF THE COUNTY WOULD BE ABLE TO CONTINUE THIS RATE OF NEW WORK, EVERY COUNTY ROAD WOULD BE PAVED ONCE EVERY 15 YEARS. OF COURSE, THIS IS AN UNSATISFACTORY TIME FRAME. THE MOST RECENT COUNTY ENGINEER'S ESTIMATE OF FUNDS NEEDED TO COMPLETELY RE-VITALIZE THE MONROE COUNTY ROAD AND BRIDGE SYSTEM IS $8,750,000.00. BASIC MAINTENANCE ON THE STATE HIGHWAY SYSTEM HAS IMPROVED GREATLY IN THE PAST FEW YEARS, DUE NO DOUBT IN PART TO THE STATE'S NEW GASOLINE TAX. HOWEVER WITH THE EXCEPTION OF SEVERAL ROUTINE BRIDGE REPLACEMENTS/REALIGNMENTS, NO MAJOR STATE CONSTRUCTION WORK HAS OCCURED IN MONROE COUNTY SINCE THE 1955 - 1965 ERA.

THE STATE OF OHIO NEEDS COMPLIMENTED FOR PROVIDING SOME ADDITIONAL FUNDING TO COUNTIES AND TOWNSHIPS THROUGH THE INCREASE IN GAS TAXES. THE FULL IMPACT OF THIS INCREASED FUNDING IS SEVERAL YEARS DOWN THE ROAD.

THERE ARE SOME SPECIFIC PROJECTS THAT HAVE BEEN IDENTIFIED

FOR IMPROVEMENT ON THE STATE ROAD SYSTEM. IN MEETINGS WITH LOCAL LEADERS HELD IN 1988, FOUR PROJECTS WERE IDENTIFIED. THE MOST IMPORTANT PROJECT WOULD BE THE CONSTRUCTION OF A 4-LANE OHIO ROUTE 7 FROM I-70 IN BRIDGEPORT IN BELMONT COUNTY TO I-77 AT MARIETTA IN WASHINGTON COUNTY. THIS WOULD OPEN UP THE OHIO RIVER AREA FOR DEVELOPMENT. THE NEXT TWO PROJECTS WERE JUDGED TO BE EQUALLY IMPORTANT. FIRST, THE UPGRADING OF OHIO ROUTE 800 FROM WOODSFIELD TO BARNESVILLE (AND ON TO I-70). I AM PLEASED TO ANNOUNCE THAT THIS PROJECT IS CURRENTLY BEING LOOKED AT AGAIN BY THE OHIO DEPARTMENT OF TRANSPORTATION. AS AN ALTERNATIVE TO THIS PROJECT, IT WAS DISCUSSED TO DESIGN A BRAND NEW HIGHWAY BETWEEN WOODSFIELD AND ST. CLAIRSVILLE THAT WOULD CONNECT TO THE PROPOSED NEW U.S. 250 FROM CADIZ. SECOND, THE IMPROVEMENT OF OHIO ROUTE 78 FROM CLARINGTON TO CALDWELL, NOBLE COUNTY. THIS ROAD IS ALSO RECEIVING IMPROVEMENTS THIS SUMMER. THE FINAL PROJECT THAT WAS IDENTIFIED IN THIS SURVEY WAS FOR A BYPASS AROUND WOODSFIELD. THE PROPOSED BYPASS WOULD TIE STATE ROUTES 78 EAST, 26 NORTH, 800 NORTH, AND 78 WEST TOGETHER. THIS BYPASS COULD ALSO AID IN THE DEVELOPMENT OF THE MONROE INDUSTRIAL PARK NORTH OF WOODSFIELD.

A BRIEF MENTION OF SOME ROAD BUILDING PROJECTS OF REGIONAL INTEREST SHOULD ALSO BE MADE. THESE WOULD INCLUDE THE COMPLETION OF OHIO ROUTE 7 THROUGH BELLAIRE; THE COMPLETION OF THE ROUTE 22 BYPASS IN WINTERSVILLE; THE RELOCATION OF U.S. 250 MENTIONED EARLIER; THE COMPLETION OF THE APPALACHIAN HIGHWAY IN ATHENS COUNTY; A NEW MUSKINGUM RIVER BRIDGE IN MARIETTA; AND FINALLY THE EXTENSION OF ROUTE 48 FROM MORGANTOWN, WV TO EITHER MOUNDSVILLE, WV OR, PREFERABLY, NEW MARTINSVILLE, WV.

ONE FINAL THOUGHT ON TRANSPORTATION--SOME CONSIDERATION NEEDS TO BE GIVEN TO THE CREATION OF A MULTI-MODAL PORT ON THE OHIO RIVER. THIS PORT WOULD NEED TO BE ABLE TO HANDLE BULK AND CONTAINERIZED RIVER CARGO, PROVIDE BOTH RAIL AND TRUCKING ACCESS, AND PERHAPS TO EVEN HAVE AIR FACILITIES.

WATER AND SEWER

MONROE COUNTY'S WATER AND SEWER NEEDS ARE AS LARGE AS ITS TRANSPORTATION NEEDS. MONROE COUNTY HAS SIX PUBLIC WATER PROVIDERS, TWO MUNICIPAL SEWAGE SERVICES, TWO TELEPHONE COMPANIES, TWO GAS COMPANIES, AND FIVE ELECTRIC POWER PROVIDERS.

GREAT STRIDES IN PUBLIC WATER SERVICE HAS BEEN PROVIDED TO MONROE COUNTIANS IN THE PAST THIRTY YEARS. AT A MINIMUM, THREE OF THE EXISTING WATER COMPANIES WERE NOT IN EXISTANCE IN 1960. PUBLIC WATER IS MORE WIDELY AVAILABLE THAN EVER BEFORE IN OUR COUNTY. PROBABLY BETWEEN 1/3 AND 1/2 OF THE POPULATION OF THE COUNTY NOW HAS PUBLIC WATER. HOWEVER, FAR LESS THAN 1/2 OF THE GEOGRAPHICAL AREA OF THE COUNTY HAS WATER SERVICE. NATURALLY THIS LACK OF A BASIC PUBLIC UTILITY PLACES SEVERE CONSTRAINTS ON GROWTH IN LARGE AREAS OF THE COUNTY.

THE SITUATION WITH SEWER IS EVEN MORE PRONOUNCED. ONLY THE VILLAGES OF WOODSFIELD, BEALLSVILLE AND WILSON HAVE PUBLIC SEWAGE. THIS MEANS THAT 4/5 OF MONROE COUNTY'S POPULATION HAS TO DEPEND ON SELF-MAINTAINED AND OFTEN, NON-FUNCTIONING SEPTIC SYSTEMS. THE OHIO & LEE WATER AND SEWER AUTHORITY AND THE VILLAGE OF CLARINGTON ARE BOTH CONSIDERING MUNICIPAL SEWAGE BUT BOTH AGENCIES ARE STRUGGLING TO LOWER HIGH USER FEES. MONROE COUNTY'S HIGH PERCENTAGE OF FIXED-INCOME, ELDERLY RESIDENTS WILL

HAVE A HARD TIME JUSTIFYING THE 30 DOLLAR AND UP MONTHLY BILLS CONTEMPLATED BY THESE SYSTEMS. OVER THE YEARS FEDERAL PROGRAMS SUCH AS EPA GRANTS AND FHA LOANS HAVE HELPED MONROE COUNTY GREATLY. NEW STATE PROGRAMS SUCH AS THE ISSUE II PROGRAM HAVE ALSO BEEN OF SOME ASSISTANCE.

ALTHOUGH THE FEDERAL GOVERNMENT DOES NOT SEEM TO BE IN A MOOD TO EXPAND SOCIAL PROGRAMS, A PROGRAM MODELED AFTER THE RURAL ELECTRIFICATION ASSOCIATION, ONLY DIRECTED AT WATER AND SEWAGE NEEDS WOULD BE WONDERFUL. THE COST WOULD LIKELY BE STAGGERING.

CLOSING

I WOULD LIKE TO CLOSE WITH A WORD OF THANKS TO BOTH THE FEDERAL AND STATE OFFICIALS HERE TODAY FOR THE ASSISTANCE THAT YOU HAVE GIVEN MONROE COUNTY TO HELP US RECOVER FROM DAMAGES OCCURING AS A RESULT OF THE JUNE 14TH FLOODS. ALTHOUGH MONROE COUNTY, THANKFULLY, DID NOT SUFFER THE DAMAGE THAT MANY SURROUNDING COUNTIES HAD, STILL OVER $500,000 IN PUBLIC AND PRIVATE DAMAGES OCCURED IN OUR COUNTY. AGENCIES INCLUDING FEMA, THE CORPS OF ENGINEERS AND ODOT, ALONG WITH THE LOCAL MEMBERS OF THE OHIO AND U.S. LEGISLATURE HAVE EARNED OUR RESPECT AND THANKS FOR THE ASSISTANCE THEY HAVE GIVEN.

July 10, 1990

Glen Anderson, Rep. Ca.
Chairman House Public Works & Transportation Comm.

Testimony - by Stuart Henderson, President
Board of County Commissioners
Harrison County, Ohio

Hearing at the Days Inn
St. Clairsville
July 16, 1990
9:00 AM

Gentlemen:
My name is Stuart Henderson, I am president of the Board of County Commissioners for Harrison County, Ohio.

Harrison County is located in South-eastern Ohio in the Appalachian Region. The major economic activities are centered around Coal Mining and Agriculture, with the Coal industry declining due to high sulfur content of the coal and recent environmental constraints on its use.

The county's economic future is dependent upon the ability to attract a diversity of industries. In order to accomplish economic growth, the infrastructure must be improved, in particular, access to the interstate highway system. Harrison County has abundant water supply, and must be able to transport that water to potential industries. In addition, the County will have to provide sanitary sewers, roads and drainage systems.

Harrison County is not in a position to be able to finance any of the mentioned infrastructures. Financing must be provided at levels sufficient to complete major projects at or near 100% grant programs. Moreover, the time frame from application to funding must be 3 months or less.

Harrison County has abundant land to provide for industrial growth, but is lacking the adequate access to market areas and the major transportation systems. The county is located off the beaten path of Interstates 70 and 77. Federal Highway Route 22 from Steubenville to The Village of Cadiz (County Seat of Harrison County) is or will be sufficient as a four lane highway. However, US Route 22 from the Village of Cadiz (West) to the City of Cambridge (Intersection of IS 70 and IS 77) needs to be made into a limited access highway, and or a limited highway connecting Cadiz to St. Clairsville and IS 70 would provide the access to the interior of Harrison County.

Other highways within the County also must be upgraded in order to provide sufficient internal transportation needs. Funds could be made available to finance such projects at the State or County level.

There are suffix impounded bodies of water as well as ground water available to support residential, commercial and industrial development. The problem the county has is being able to transport water to potential sites that may be located long distances from existing facilities or that the existing facilities may be under-sized or insufficient to provide adequate water pressure. The topography of the county is such that building sites are located based upon available relatively level land, consequently, the distance infrastructure facilities must be placed in order to provide service to such locations can become too costly or prohibited for the county or the municipalities to finance such projects. Federal assistance would be required in order to provide such infrastructure to provide economic development in creating jobs for the county's high un-employment rate (10.7 May, 1990) or for its under-employed residents.

Infrastructure in place at the several county industrial parks is a must in order to attract industry to locate within the county. When an industry is contemplating a site for expansion or location, they are looking for sites that contain all required facilities, particularly water and sanitary sewer. Consequently, funding for such improvements must be made available without a commitment from an specific industry to locate there. Counties and communities need infrastructure financing in order to provide industrial sites complete, with all utilities intact. At this point, economic development can become a viable instrument to attract companies thereby creating the economic base and creating jobs for its un-employed and under-employed.

Harrison County's highway system and access to the State and Federal highway system is critical in terms of economic growth. The major access to the county, as mentioned above, must be provided in order to attract growth. This highway system must be placed upon a high priority now and funds be make available for implementation in the near future. Not only is the industrial aspects required, but recreation and tourism within Harrison County must also be promoted.

In summary, Political units such as Harrison County with weak economic activity, needs financial assistance to provide the basic needs in order to attract the growth necessary for economic survival. Federal assistance and financing must be targeted toward those counties and communities that have deficient or declining economies or have high levels of un-employment or under-employment. Financing levels must be provided prior to specific project commitments and at or near 100 % financing.

Dale Hileman - Cambridge
District Economic Development Manager - Columbia Gas of Ohio, Inc. Our Eastern District serves in 18 counties which includes Congressman Applegate's 18th District.

SUBJECT: INFRASTRUCTURE FUNDING

If a community expects to be competitive in the economic development world, they must develop their BEST industrial site or park complete with infrastructure (fully serviced - including: water, sewer, utilities, road and possibly rail). A plain "green field" will rarely attract prospective industry. Time constraints and known costs are a major part of the selection process.

Recently, Eastern Ohio formed a 13 county economic development region. All but one county included in Congressional District 18 is participating in this 13 county region.

A survey completed just last week with this 13 county region ranks infrastructure as first of three top priorities to enhance economic growth. Infrastructure is very critical to the development of industrial parks or sites. Industrial prospect competition is so keen today.

Permit me to cite just two specific examples:

Carroll County - Currently a major federal prospect is considering locating in Carroll County. This potential facility would initially employ approximately 700 with a possibility of doubling employment. The first major hurdle is to furnish the necessary infrastructure to service this facility. Funding must be available for this project.

Guernsey County - Recently a major industrial prospect even requested to located in Guernsey County. This company would initially employ approximately 700 to 1,000 employees. Once again, the first requirement was approximately 150 acres with the necessary infrastructure. Unfortunately, this was not available and the prospect was forced to continue looking outside the region.

May unemployment figures in Guernsey County were 8.7%. Harrison and Monroe are in double digits. Average unemployment in 18th District is 7.5%. We cannot afford to lose jobs because of insufficient infrastructure.

In the site selection process, potential industry is looking for reasons to eliminate a community. Eastern Ohio is not presently the hot spot for economic growth. Communities must start by having industrial sites or parks fully serviced (infrastructure).

Let me also add that approximately 70% of industrial prospects are looking for good available industrial buildings, naturally, including the infrastructure. Many communities in Eastern Ohio do not have available industrial buildings and cannot afford to construct even a spec building. Again, if we expect to compete in the economic development world, funding must be available for industrial spec building construction with infrastructure.

Thanks for permitting me to testify regarding the need for infrastructure funding and its important contribution to economic development growth.

WRITTEN TESTIMONY BEFORE:

THE HONORABLE GLENN M. ANDERSON, CHAIRMAN
HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
July 16, 1990 - St. Clairsville, Ohio

BY: BERNARD B. HURST, DIRECTOR, OHIO DEPARTMENT OF TRANSPORTATION

The efficient movement of people and goods is the backbone of our economy and the preservation of our nation's infrastructure is one of the gravest concerns facing America today. As we look toward the 21st century, we must realize that to stay competitive in the global market will require intense research and planning along with increased funding to provide the nation with a transportation system necessary to meet this goal.

However, federal budget deficits have significantly reduced the amount of federal funding channeled into needed infrastructure programs leaving state government with a burdening share. Common ground must be reached by state and federal government to rectify decades of deterioration and neglect adversely impacting our nations infrastructure.

The overall percentage of federal funds used in highway projects has declined significantly in recent years as state and local governments have picked up an increasingly larger portion of the share.

For example, during the current fiscal year 1990-1991, Ohio's highway maintenance needs far outweighed our budget. A shortfall of $223 million last year and an estimated $159 million this year put the biennium shortage at $382 million.

Ohio has 112,153 total miles of roadway of which ODOT is responsible for the preservation of 19,000. Our system goal each year is to resurface or rehabilitate 10 percent of our mileage. This means that 1,900 miles need to be programmed each year if we are to stay on top of system preservation. Our first goal has been to earmark as much of the budget as possible to this area, while at the same time, trying to meet the most critical of new construction demands. Since ODOT has been unable to keep up with this goal over the past several years, a back log is growing. We presently have nearly 300 miles of resurfacing backlog each year.

-more-

Take 2

Ohio bridges fare no better. Statewide there are 42,968 bridges of which 8,088 are structurally deficient or functionally obsolete. Of the 14,875 bridges that ODOT is directly responsible for, over 15 percent need to be rehabilitated or replaced. And for the 28,000 bridges on the local system, 20 percent need to be replaced or rehabilitated, local bridges top 20 percent in this critical category. Given a 50 year life span, 300 bridges on the ODOT state system should be replaced each year. Last year only 138 were replaced.

Little new construction could be accomplished in the future considering the costs of maintaining and improving all our existing roadway. In order to maximize existing funding, an efficient method of allocating highway funds was needed. In response, the department has instituted a pavement management system to prioritize rehabilitation and resurfacing projects along Ohio's multi-lane divided highways. We are also developing a bridge management system based on the same concept and goals.

Since 1983, ODOT has also made significant improvements in the quality of Ohio's highway system. These improvements were achieved through the Operation Jobs--Highways Program. Initiated in 1985, the program has been a key tool in spurring economic development by building and upgrading Ohio's transportation system. It has provided $1.9 billion in highway construction projects and has created more than 100,000 jobs for Ohioans. The Federal Highway Administration estimates that each $1 billion in highway construction generates more than 50,000 jobs.

By increasing the states gasoline tax, ODOT's primary source of revenue, the Ohio legislature has continued to support our efforts in maintaining and improving Ohio's roadways. In July 1989, the General Assembly approved a 5.2 cents per gallon increase over two years to provide more money for state and local highway and bridge construction. The third increase in three years, it brought the then current 14.8 cents per gallon to 20 cents this month. Ohioans now pay the sixth highest gas tax in the nation. The 5.2 cents increase will produce $297 million annually.

Under terms of the increase, revenue from the first one cent of the increase each year will be set aside for local governments. The rest of the increase is shared according to the traditional formula of 75 percent state and 25 percent local - with a requirement that all of the state's share be used for new construction and reconstruction projects over a two year period.

-more-

Take 3

As a direct result, Governor Richard F. Celeste and I spent the first half of 1990 traveling across the state to announce 88 new construction projects in 44 counties worth $1.1 billion. Many of the announced projects will provide a growth corridor for affected local communities and alleviate traffic congestion enabling existing roadway to serve the public better.

According to a 1986 study by The Road Information Program (TRIP), Ohio counties face a budgetary shortfall of $225 million a year to catch ~~up~~ with needed infrastructure projects from now until the year 2000. In order to help local governments meet the need, during fiscal year 1988 ODOT began giving 30 percent of our minimum allocation funds to supplement urban system funding. The money is distributed on a need basis to Ohio's 16 Metropolitan Planning Organizations representing large cities and 7 smaller cities with populations ranging between 25,000 and 50,000 people.

Ohio is also utilizing inovative funding techniques to compensate for lack of funding for highway improvements. By combining public and private monies, we have aided economic development and job opportunities while improving the surrounding transportation system.

In 1989, Ohio's first privately financed interchange - the Tuttle Road Interchange - opened in northwest Columbus at a cost of $3.5 million. Paid for entirely by the Edwards Land Company, the completed interchange was essential to developing surrounding acreage and creating several thousand new jobs.

Construction of a second privately financed interchange, this one on I-71 in Delaware County, will start this month. In addition to providing long desired access to I-71 in Southern Delaware County, the new interchange will spur economic development of 1,400 acre tract which will could ultimately provide as many as 30,000 new jobs. Although both interchanges will be built with private monies, ODOT has made them possible by agreeing to construct additional lanes on the interstate to handle expected traffic increases.

ODOT has also taken great strides to improve and emphasize multi-modal transportation in Ohio. The department has rail, air, transit, and water divisions that provide planning and technical assistance and guide funding to various communities for modal transportation development. Also, a Bureau of Bicycling assists many local communities in establishing bike trails.

-more-

Take 4

Public transit systems are integral in relieving traffic congestion into urban areas and are the only available means of transportation for many Americans. In 1989, ODOT's public transit section managed more than $30 million in state funds matched by federal and local dollars to aid our 58 public transit sytems - the fourth largest transit fleet in the country. Ohio also has numerous demand-responsive systems serving senior citizens and people with disabilities. However, in fiscal year 1990, the federal government cut transit funding by about 6 percent nationwide. While federal goverment scales back revenue, capitol and operating costs for transit systems across the country are rising.

Rail and water transportation funding has also incurred significant federal funding cuts despite its importance in shipping goods and enhancing economic development to Ohio. In 1989 ODOT's Rail Division helped retain or create 5,000 jobs in 10 Ohio communities by providing new track, switches and signals to eleven industries.

Highway and rail funds were used by ODOT to improve shipping capabilities in 1986 when the Honda Motor assembly plant doubled its facility in Marysville. The plant employs 8,000 people and represents an investment of almost $1.7 billion in the state of Ohio.

Despite Ohio's recent efforts to compensate for dwindling federal funding, we still remain far behind meeting infrastructure needs. And yet, the new transportation policy set forth by the Bush Administration argues that the responsibility of the nation's infrastructure program should be further shouldered by state and local government.

This year alone, Ohio taxpayers will pay approximately $531 million in federal gas tax, but will only receive about $496 million back in the form of federal highway and transit funds. Ohio will lose approximately $35 million. And spending of another $14 million of our fiscal year 1990 funding will be deferred while the federal government locks away $17 billion in Highway Trust Funds to create an apparent reduction in the federal deficit.

-more-

· As of June 30, Ohio's current unobligated balance in federal funding categories subject to the obligation ceiling is $365 million. Obligation Ceilings are constraining an otherwise successful transportation program and should be eliminated so Ohioans can put their investments to work. Let's put the "trust" back into the highway trust fund.

Reauthorization of the federal highway program in 1991 should also inlcude - at the very least - an increase of the 85 percent Minimum Allocation Program to 90 percent. As a donor state, the program assures that Ohioans get back a greater portion of the amount of funds we pay into the highway fund. A 90 percent return on our contribution is more reasonable.

Increased flexibility in federal funding procedures would also allow ODOT to allocate money more efficiently. An example is the popularity and success of the minimum allocation program. It hinges on its flexibility in allowing states to channel funding according to the infrastructure needs of each state.

In addition, federal funding should be maintained at the highest level possible for public transit, water and rail transportation - as well as highways.

Though we have made many accomplishments in the past eight years during the Celeste Administration, it is vital that we persevere in our battle in building better infrastructure. Ohio has worked hard to gain a positive reputation as an economic market leader, and we as public servants, owe it to our constituents--Ohio taxpayers-- to keep the door open.

The most neglected funding category for transportation is in the research area. Spending today for highway research is aplproximately 0.2% of our total highway expenditure. While successful private corporations allocate approximately 6% of their total budget to research and development, funds for highway research has steadily declined over the past several years. The need exists for us to provide better materials, better design and better construction techniques - all made possible through adequate research and development programs.

There is pressing need to combine the research for highways with all other modes in order to learn how to best connect the different modes in promoting a balanced transportation system. Problems exist today in combining research funds from the various USDOT Administrations. Intermodal connections between the various modes will present major problems that should be addressed now by proper research.

-more-

Take 6

While we all agree that highway and all other transportation systems need to be designed, constructed and maintained to provide safe facilities for the travelers, we have learned that even the safest of facilities will not protect the errant or inattentive driver.

We speend billions of dollars each year building and incorporating safety features into our highway systems, yet accidents and deaths continue on these safest of highways. There needs to be a better program aimed at improving these errant and inattentive drivers by an educational process that will improve their awareness and will eliminate their physical and mental deficiencies caused by substance abuse, tiredness and inattentiveness. I feel a substantial investment in this type of an educational program will save more lives than our highway safety improvement investments.

###

FACTS ON IMPACT OF OHIO FLOODING:

In the last six weeks, 16 Ohio counties have been declared disaster areas as a result of floods, tornados and severe storms. As a key member in the states disaster relief plans, ODOT immediately dispatched crews (men, women and equipment) to effected areas, such as Shadyside in which 26 people were killed.

Roads and bridges on ODOT's system suffered limited damage - State Route 147 required some repair. However, local road and bridge systems were impacted heavily.

The Federal Emergency Management Agency is presently surveying the damages. ODOT will have spent in excess of $1 million (ballpark figure) of our budget responding to the emergency. Provided the FEMA approves all our expenditures, we will be reimbursed for 75 percent of what we spent. Local government will receive 75 percent of approved expenditures, plus 12 and a half percent from the state.

INFRASTRUCTURE NEEDS FOR HARRISON AND JEFFERSON COUNTIES

State Representative Jerry W. Krupinski 98th Ohio House District
U.S. House Public Works and Transportation Committee Hearing
July 16, 1990 St. Clairsville, Ohio

DURING THE PAST DECADE, SOUTHEASTERN OHIO HAS BEEN BESET BY A VARIETY OF CIRCUMSTANCES WHICH HAVE CONTRIBUTED TO HIGH UNEMPLOYMENT, PARTICULARLY IN THE MINING AND STEEL INDUSTRIES, A CORRESPONDING DECREASE IN THE TAX BASE, AND A DRAMATIC DECLINE IN POPULATION. ANY ONE OF THESE FACTORS WOULD GENERATE A NEGATIVE IMPACT ON THE LOCAL ECONOMY AND A DECREASE IN REVENUE TO GOVERNMENTAL ENTITIES. HOWEVER, THE COMBINATION HAS PRODUCED A DEVASTING EFFECT ON THE COUNTY AND LOCAL GOVERNMENTS AND THEIR ABILITY TO MAINTAIN THEIR RESPECTIVE INFRASTRUCTURE SYSTEMS. THIS CERTAINLY LEAVES NO RESOURCES TO EXPAND SERVICES.

THE AREA IS NOW FACED WITH THE REALITY OF BEING UNABLE TO GENERATE REVENUE AS IN THE PAST. WITH LESS POPULATION, FEWER VEHICLES, AND THEREFORE LESS REVENUE FROM LICENSE PLATES AND WATER AND SEWER SYSTEMS, INFRASTRUCTURE BUDGETS HAVE BEEN DECIMATED.

HARRISON AND JEFFERSON COUNTIES BOTH HAVE APPROXIMATELY 260 MILES OF COUNTY ROADS TO MAINTAIN, AND 450-500 BRIDGES. MANY OF OUR BRIDGES ARE STRUCTURALLY DEFICIENT OR FUNCTIONALLY OBSOLETE, WITH WEIGHT LIMITS POSTED AT LESS THAN LEGAL LOAD. THE ROUGH TERRAIN AND TOPOGRAPHY TAX THE MAINTENANCE BUDGET. A SEVERE WINTER MEANS LITTLE FUNDS LEFT FOR A SUMMER RESURFACING PROGRAM. THESE MAJOR RESURFACING PROGRAMS ARE NEEDED FOR BOTH COUNTIES. THE BAND-AID REPAIRS ARE BEYOND BEING CAPABLE OF SUSTAINING THE ARTERIES OF THE AREA.

WATER AND SEWER SYSTEMS IN BOTH COUNTIES VARY FROM VIRTUALLY BRAND NEW SYSTEMS TO A FEW COMMUNITIES WITH WOODEN LINES, FREQUENT BOIL ORDERS, AND FAILED SEPTIC SYSTEMS. APPROXIMATELY FOUR VILLAGES IN HARRISON COUNTY ARE WITHOUT SANITARY SEWER SYSTEMS AND SIX VILLAGES IN JEFFERSON COUNTY HAVE NO SANITARY SYSTEMS. FOUR TO FIVE VILLAGES ARE IN NEED OF MAJOR UPGRADING OF THEIR WATER

SYSTEMS. ADDITIONALLY, VARIOUS RURAL SECTIONS OF BOTH COUNTIES NEED DRINKING WATER SYSTEMS. DUE TO THE SPARSE POPULATION IN THE RURAL AREAS, IT IS NOT ECONOMICALLY POSSIBLE TO DESIGN A WATER SYSTEM BASED OF FHA GUIDELINES. THIS, IN TURN, HURTS BOTH RESIDENTIAL AND ECONOMIC DEVELOPMENT.

A PARTIAL SOLUTION TO THESE PROBLEMS HAS BEEN THE STATE OF OHIO ISSUE 2 PROGRAM. DESIGNED PRIMARILY FOR REPAIR AND REPLACEMENT OF EXISTING INFRASTRUCTURE SYSTEMS, ISSUE 2 ADDRESSES ONLY 3 TO 5 PERCENT OF THE TOTAL INFRASTRUCTURE NEEDS. HOWEVER, ISSUE 2 IS HAVING A MUCH LARGER IMPACT IN HARRISON AND JEFFERSON COUNTIES. GREAT IMPROVEMENTS HAVE BEEN MADE TO ROADS, BRIDGES, WATER AND SEWER SYSTEMS.

ANOTHER PARTIAL SOLUTION IS UTILIZATION OF THE FEDERAL HIGHWAY TRUST FUND. HOWEVER, THIS SMALL ALLOTMENT, COMBINED WITH LOW REVENUE, MAKES IT VIRTUALLY IMPOSSIBLE TO MEET THE 25 PERCENT MATCH. ALSO, DUE TO OUR TOPOGRAPHY AND ALIGNMENT OF COUNTY ROADS, CURRENT FHWA REGULATIONS DRIVE THE COST PROJECTS TO AN UNAFFORDABLE STATUS FOR OUR COUNTIES.

HARRISON AND JEFFERSON COUNTIES ARE HELPING THEMSELVES. ENACTMENT OF PIGGY-BACK SALES TAX, HIRING FULL-TIME ECONOMIC DEVELOPERS, UTILIZATION OF EXCITING RESOURCES, ARE SOME OF THE TOOLS THEY ARE CURRENTLY USING.

SOUTHEAST OHIO HAS NOT EXPERIENCED THE ECONOMIC RESURGENCE THAT OTHER AREAS OF OHIO AND THE UNITED STATES HAVE REALIZED. I DO NOT WANT TO SEE OUR YOUTH CONTINUE TO LEAVE THE AREA. WE ARE FACED WITH AN AGING POPULATION AND AN AGING INFRASTRUCTURE.

I FEEL A WORKABLE SOLUTION WOULD BE A PROGRAM SIMILAR TO REVENUE SHARING. FUNDS WOULD BE DISTRIBUTED DIRECTLY TO LOCAL GOVERNMENTS FOR HIGHWAY, BRIDGE, WATER AND SEWER PROJECTS, WITH SIMILAR GUIDELINES TO THE ISSUE 2 PROGRAM. A PROGRAM WITH MINIMAL RED TAPE THAT WOULD BENEFIT LOCAL COMMUNITIES THE MOST.

UNTIL WE CAN UPGRADE OUR INFRASTRUCTURE, IT WILL BE EXTREMELY DIFFICULT TO BRING IN NEW PEOPLE AND NEW INDUSTRY,TO ONE OF THE MOST BEAUTIFUL REGIONS IN OHIO AND IN THE EASTERN UNITED STATES.

I AM JOHN LASLO, FORMER MAYOR OF MARTINS FERRY. I CHAIR THE SHORT CREEK VALLEY HIGHWAY COMMITTEE AND IN BEHALF OF OUR COMMITTEE WE THANK YOU FOR PERMITTING US TO PRESENT OUR PROJECT FOR YOUR CONSIDERATION.

I FIRST BECAME INVOLVED WITH THE SHORT CREEK VALLEY PROJECT IN 1963. AT THAT TIME I WAS EMPLOYED AT THE MARTINS FERRY PLANT OF THE WHEELING STEEL CORPORATION AS ASSISTANT SUPERINTENDENT OF THE SHIPPING DEPARTMENT. AT THAT TIME THE MARKET AREA OF OUR FINISHED PRODUCTS WAS ABOUT THE SAME AS IT IS TODAY.

OUR PLANT MANAGER HEARD OF MEETINGS THAT WERE BEING HELD IN ADENA, IN THE SHORT CREEK VALLEY. PURPOSE, THE SAME AS NOW, A NEW HIGHWAY THROUGH THE VALLEY. ONLY ONE DIFFERENCE. FIRST DISCUSSION CENTERED AROUND RELOCATING R250 FROM CADIZ THROUGH THE SHORT CREEK VALLEY TO ROUTE 7 AT RAYLAND. AFTER SOME DISCUSSION THE RELOCATION IDEA WAS DROPPED AND WE PROPOSED RE-REROUTING R150 FROM R250 TO ROUTE 7 AT RAYLAND.

AFTER A NUMBER OF MEETINGS, THE ODOT EMPLOYED RACKOFF ASSOCIATES, INC. OF COLUMBUS, TO PREPARE A LOCATION STUDY BETWEEN U.S. R250 AND RAYLAND. THE STUDY WAS PRESENTED TO MR. PHILIP RICHLEY, DIRECTOR OF THE OHIO DEPARTMENT OF TRANSPORTATION ON APRIL 5, 1974. I RECEIVED THE ATTACHED LETTER, DATED JUNE 25, 1975 SIGNED BY DAVID L. WEIR, ASSISTANT DIRECTOR OF ODOT. PLEASE NOTE THAT ODOT OFFICIALS AT THAT TIME, AT LEAST TO OUR UNDERSTANDING, MADE A COMMITTMENT TO USE ODOT STAFF TO DO THE NECESSARY ADDITIONAL STUDIES TO SATISFY THE FEDERAL HIGHWAY ADMINISTRATION'S REQUIREMENT.

THE STUDY CONTAINS FOUR CHOICES FOR ROUTES FOLLOWING APPROXIMATELY THE SAME LINE OF DIRECTION AND ACCOMMODATING THE SAME VILLAGES. PRESENT ROADS IN THE AREA, ACCORDING TO THE STUDY, ARE EITHER GRAVEL SURFACED OR DIRT. THE STUDY NOTES THAT COUNTY ROADS IN THE AREA ARE NARROW WITH LITTLE OR NO SHOULDER. THESE ROADS, THE STUDY STATES, ARE PAVED, BUT HEAVEY TRUCK TRAFFIC AND WINTER WEATHER KEEP THEM IN DISREPAIR.

ODOT, DISTRICT 11 HAD INDICATED THAT THEIR STAFF WOULD BE AVAILABLE FOR THIS STUDY UPON COMPLETION OF THEIR WORK ON THE JEFFERSON COUNTY U.S. R22, REED'S MILL TO THE OHIO RIVER, STUDY.

IN JUNE OF 1985, THE MAYORS OF SOUTHERN JEFFERSON COUNTY REQUESTED A MEETING AND DECIDED TO RESUME THEIR EFFORTS TOWARD CONSTRUCTION OF THIS HIGHWAY.

CONSTRUCTION OF THE SHORT CREEK VALLEY HIGHWAY WILL, (1) PROVIDE A HIGHWAY FOR GENERAL TRAFFIC WHICH HAS BEEN NEEDED FOR MANY, MANY YEARS. SECONDLY, IT WILL PROVIDE THE IMPETUS FOR INDUSTRIAL DEVELOPMENT, ALSO MUCH NEEDED IN SOUTHERN JEFFERSON COUNTY AND EASTERN OHIO. THERE ARE POTENTIAL INDUSTRIAL SITES IN THE SHORT CREEK VALLEY WHICH ARE RATED AS EXCELLENT.

ADEQUATE HIGHWAY TRANSPORTATION IS THE LIFE BLOOD OF INDUSTRIAL AND ECONOMIC GROWTH. THEREFORE, THE AVAILABILITY OF ADEQUATE ROADS TO MEET THE DEMAND OF TRANSFERRING MANUFACTURED GOODS IS ESSENTIAL. THE TIME IT TAKES FOR VEHICLES TO TRAVEL FROM THE MANUFACTURING SITE TO THE DELIVERY POINT MUST BE CONSIDERED. CONCERN IS NOT ONLY WITH SHIPPING TIME AND WAGE

EXPENDITURES BUT ALSO WITH THE AMOUNT OF GAS OR DIESEL FUEL CONSUMED.

THE JEFFERSON COUNTY INDUSTRIAL PARK SITE SURVEY PREPARED BY THE JEFFERSON COUNTY REGIONAL PLANNING COMMISSION AND FINANCED BY A GRANT FROM THE APPALACHIAN REGIONAL COMMISSION AND FINANCIAL ASSISTANCE FROM THE STEUBENVILLE AREA CHAMBER OF COMMERCE POINTED OUT THE TOP TEN INDUSTRIAL PARK SITES AND 25 ADDITIONAL SITES. FOUR OF THE TOP TEN ARE LOCATED IN THE SHORT CREEK VALLEY AREA AND OF THE REMAINING SITES POINTED OUT, SEVERAL ARE CLOSE BY. THE SURVEY IS A GOOD ONE AND POINTS OUT THAT "GOOD TRANSPORTATION" PLAYS AN IMPORTANT ROLE IN REGIONAL ECONOMIC DEVELOPMENT.

PEOPLE IN THE SHORT CREEK VALLEY ARE TRYING AND WORKING HARD TO REVITALIZE THE AREA. THE SHORT CREEK WATER SHED PROGRAM IS MOVING AHEAD. THIS PROJECT IS MEANT TO HELP CONTROL FLOODING IN THE AREA AND WILL ALSO PROVIDE ADDITIONAL ECONOMIC DEVELOPMENT LAND AREA AVAILABLE TO PROVIDE JOBS.

RESIDENTS OF THE SHORT CREEK VALLEY AND A GREAT PERCENTAGE OF THE PEOPLE IN THE OHIO VALLEY AREA SUPPORT THE CONSTRUCTION, OF THIS HIGHWAY. THE WORKING COMMITTEE INCLUDES MEMBERS FROM THE JEFFERSON COUNTY BOARD OF COMMISSIONERS, THE EASTERN OHIO MAYORS ASSOCIATION, THE BUCKEYE LOCAL BOARD OF EDUCATION, THE BUCKEYE LOCAL MINISTERIAL ASSOCIATION, VILLAGE COUNCILMEN, TRUSTEES FROM THE ABUTTING TOWNSHIPS, SCHOOL ADMINISTRATORS, JEFFERSON COUNTY ENINGEER, REPRESENTATIVES OF LOCAL ORGANIZATIONS, CHAMBER OF COMMERCE AND PRIVATE CITIZENS.

WE NEED A GOOD HIGHWAY FOR SAFE TRAVEL FOR ALL PEOPLE, PARTICULARY OUR SCHOOL CHILDREN WHO WILL BE TRAVELING FROM ALL SECTIONS OF THE SHORT CREEK VALLEY TO A NEW SCHOOL IN CONNERVILLE. WE NEED A HIGHWAY SO THAT WE CAN EXPAND OUR AREA-BRINGING TO IT NEW INDUSTRY AND BUSINESS, TO PROVIDE JOBS AND TO STOP THE OUT-MIGRATION OF OUR PEOPLE TO OTHER AREAS. WE HAVE HUNDREDS OF ACRES IN THE SHORT CREEK AREA FOR INDUSTRIAL, COMMERCIAL AND RESIDENTIAL DEVELOPMENT. I'LL SAY AGAIN, THE PEOPLE OF SHORT CREEK VALLEY ARE TRYING AND WORKING HARD TO REVITALIZE THE AREA.

WE RESPECTIVELY ASK YOUR CONSIDERATION OF OUR AREA AND IT'S GROWTH.

MUCH OF OUR EASTERN OHIO AREA IS A "DEPRESSED AREA". WE WERE BASICALLY A COAL AND STEEL AREA.

IN DISTRICT 6 OF THE U.M.W.A.

JANUARY 1, 1977 - 16,018 MINERS ACTIVELY EMPLOYED.

APRIL 1, 1989 - 4,040 MINERS WORKING.

IN DISTRICT 23 OF THE U.S.W.A.

1970 - 33,000 STEELWOKERS EMPLOYED.

1989 - 26,000 STEELWORKERS EMPLOYED.

THE FOLLOWING APPEARED IN A LOCAL NEWSPAPER.

HARRISON COUNTY RANKED THIRD AMONG OHIO'S 88 COUNTIES IN THE PERCENTAGE OF RESIDENTS LIVING BELOW THE POVERTY LEVEL IN 1988.

HARRISON COUNTY'S POVERTY LEVEL IS 29.4 PERCENT.

MOST EAST OHIO COUNTIES RANK IN THE TOP 25 IN POVERTY RATES AMONG THE STATES 88 COUNTIES IN 1988.

BELMONT COUNTY RANKS 23RD WITH 19.1 PERCENT, JEFFERSON COUNTY IS 21ST WITH 19.9 PERCENT.

EIGHT OF THE 12 COUNTIES WITH INCREASES OF AT LEAST 75% SINCE 1980 ARE IN EAST OHIO - BELMONT, MONROE, JEFFERSON, HARRISON AND GUERNSEY ARE LISTED AMONG THE EIGHT.

ARTHUR R. BOWERS
STATE REPRESENTATIVE –
STATEHOUSE
COLUMBUS, OHIO 43215

JUN 30 1975

June 25, 1975

Honorable Arthur R. Bowers
Ohio House of Representatives
State House
Columbus, Ohio 43215

Dear Mr. Bowers:

The need for an improved highway facility through the Short Creek Valley (corridor) has long been recognized by the Ohio Department of Transportation, and as a result, considerable study effort has been devoted to satisfy this need. Our files contain numerous letters and petitions dating back to the early 1960's, citing the local need and desire for such an improvement.

As you are aware, considerable local concern was expressed during the course of development of the U.S. Route 250 study, and as a result, the subsequent decision by the Department to relocate this facility southward from Cadiz to St. Clairsville rather than through the Short Creek Valley. This decision was of course based on the standards and needs of the Federal Route, but was in no way an attempt to overlook the economic well being of the Short Creek Valley area.

On July 2, 1971, the Department authorized the engineering consultant, Rackoff Associates, Inc., to proceed with an engineering report for S.R. 150 in accordance with the intent of the public hearing held on April 23, 1970 in Dillonvale and the subsequent entry on the Journal of the Director of Highways, Volume 55, Page 635, June 23, 1970. The intent here primarily being the establishment of S.R. 150 in the Short Creek Valley between U.S. 250 and S.R. 150 at Dillonvale subsequent to an accepted location determined through the State and Federal Transportation Development Processes.

The Federal Highway Administration on August 28, 1974 disapproved the consultant's final draft report for purposes of advancing the project to a location public hearing. From their viewpoint, the report by limiting all alignments within the valley proper did not address to all potentially feasible location alternatives. While FHWA acknowledges the unique problems for highway construction in this area, they concede the matter of alternatives could be readily handled. We concur this is the case; however, this will involve additional engineering and environmental study time.

Honorable Arthur R. Bowers
Page -2-
June 25, 1975

Since our consultant has nearly expended the allocations under his present agreements, the Department has concluded that because of our funding restraints, the necessary additional studies to satisfy the Federal Highway Administration's requirement should be completed by Departmental Staff. ODOT, District 11, has indicated that their staff would be available for this study upon completion of their work on the Jefferson County U.S.R. 22, Reeds Hill to the Ohio River, Study.

Basically then, the status of the S.R. 150 project development is awaiting further alternative studies necessary to satisfy the Federal Requirements.

We trust this status report will meet your immediate needs and wish to convey that the Department is also desirous of an early solution to the transportation needs of the Short Creek Valley.

If we can be of further service, please advise.

Very truly yours,

David L Weir

JIM BOWEN
DIRECTOR

SECOND FLOOR
2084 NATIONAL RD.
WHEELING, WV 26003
304-242-6544

July 13, 1990

Mr. John Laslo, Chairman
Short Creek Valley Highway Committee
1213 Indiana Street
Martins Ferry, Ohio 43935

Dear Mr. Laslo:

This letter is in support of the construction of a new federal highway between Cadiz and Rayland, via Foxes Bottom, Harrison County and extending through the Short Creek Valley in Jefferson County and connecting with State Route 7 at the Ohio River at Rayland, Ohio and extended into West Virginia with a highway bridge at Rayland to the Short Creek Valley in West Virginia at the Brooke-Ohio Counties boundary.

The Ohio Department of Highways should consider the construction of a new federal highway in the Harrison and Jefferson County area for the purpose of relocating and/or extending and improving the existing highway network between Cadiz and Rayland. The development of the Short Creek Valley area is of vital importance to the citizens of this region.

The proposed route would serve existing industries in Eastern Ohio and the Northern Panhandle of West Virginia, especially along the Ohio River, where steel mills, power plants, paper mills and chemical plants would be served. Currently, no highway bridge across the Ohio River exists between Bridgeport and Steubenville. A bridge in this area is of vital importance to the economic development of the Upper Ohio Valley.

New industry and commerce would be encouraged by a new federal highway creating more employment for the economically depressed area of Harrison, Jefferson and Belmont Counties.

The United Steelworkers of America has lost thousands of members in this valley and I feel that this transportation improvement would greatly enhance the area by improving present businesses and attracting new businesses. Our Union wholeheartedly endorses this project and urges those who can make it become reality to do so as soon as possible.

Sincerely,

Jim Bowen

Subject: Short Creek Valley Highway Improvement Project
Proposed Highway Extending From Rayland To Cadiz, OH

We have reviewed the possible effects that this construction would have on the transportation of products to and from our Ohio plants via motor carrier.

It appears that the effects would all be positive for our corporation. The potential benefits are discussed below.

1. Motor carrier operating costs would be reduced on steel shipments to our customers in Northern Ohio, Northern Illinois, Northern Indiana, and in the states of Iowa, Michigan, Nebraska, Minnesota, and Wisconsin.

2. Although the truck lines would only reduce operating distances by about six to ten miles depending on destination, operating time would be reduced by about one hour. In addition to the savings realized in time and fuel, there would also be a savings gained because the motor carriers could avoid the Ohio Turnpike which is a toll road. These cost savings would eventually be reflected in the transportation rates that Wheeling-Pittsburgh pays to the motor carriers.

3. An additional benefit that would accrue for our plants and, incidentally, for the motoring public in general, is that highway congestion would be reduced on Route 7 near Steubenville and to a lesser extent on Route 7 near Bridgeport, Ohio. This would occur because trucking companies now route their trucks to the territory discussed above either North or South on Route 7 to join up with efficient westbound highways. With opening of the proposed highway, these trucks would exit Route 7 at Rayland rather than passing through Steubenville or Bridgeport.

4. The above comments for outbound shipments of steel would also apply on motor carrier shipments of raw materials to our plants. These products woud include lime, coal, zinc, industrial compounds, etc., that are routed to us from Northern Ohio, Northern Indiana, Northern Illinois, and the state of Michigan.

On a monthly basis we estimate that there would be 2,600 truckload shipments of steel that would take advantage of the proposed new highway, and on inbound material we estimate that about 100 truckloads a month would take advantage of the proposed highway.

DATE: July 12, 1990

FROM: James R. Stevick

Subject: Short Creek Valley Highway Improvement Project

Relative to our various conversations concerning this project, the following facts are presented to lend our favorable support to this improvement.

If present business conditions continue, motor carrier equipment and drivers are expected to shrink over the next two years by as much as 20%. Reasons: Drug testing, Commercial Driver's License testing, Department of Transportation annual mandatory equipment inspection and low alcohol blood level restrictions for heavy duty truck drivers (.04) could go to .00 in the next few years.

Any road improvement resulting in route shortening will enhance our ability to attract trucks into the Ohio mills, hopefully diverting them from competitors in Western Pennsylvania and West Virginia.

A survey of only one of our major customer's tonnage indicates that we could expect a freight savings in the area of $150,000.00 per year under todays conditions.

I have personally interviewed several truck drivers (owner operators) who transport shipments from all three of our Ohio locations and they indicated that this road, if completed, would be used by them from each plant.

I believe Wheeling-Pittsburgh Steel Corporation should support the efforts of the group that is pushing for this improvement.

IN SUPPORT OF THE CONSTRUCTION OF A NEW FEDERAL HIGHWAY BETWEEN CADIZ AND RAYLAND, VIA FOXES BOTTOM, HARRISON COUNTY AND EXTENDING THROUGH THE SHORT CREEK VALLEY IN JEFFERSON COUNTY AND CONNECTING WITH STATE ROUTE 7 AT THE OHIO RIVER AT RAYLAND, OHIO AND EXTENDED INTO WEST VIRGINIA WITH A HIGHWAY BRIDGE AT RAYLAND TO THE SHORT CREEK VALLEY IN WEST VIRGINIA AT THE BROOKE-OHIO COUNTIES BOUNDARY.

We are requesting that the Ohio Department of Highways consider the construction of a new federal highway in the Harrison and Jefferson County area for the purpose of relocating and/or extending and improving the existing Highway network between Cadiz and Rayland.

The development of the Short Creek Valley area is of vital importance to the citizens of this region.

The proposed route would serve existing industries in Eastern Ohio and the Northern Panhandle of West Virginia, especially along the Ohio River, where steel mills, power plants, paper mills and chemical plants would be served. Currently, no highway bridge across the Ohio River exists between Bridgeport and Steubenville. A bridge in this area is of vital importance to the economic development of the Upper Ohio Valley.

New industry and commerce would be encouraged by a new federal highway creating more employment for the economically depressed area of Harrison, Jefferson and Belmont Counties.

The new highway would also serve to transport school pupils in the Buckeye Local School District which traverse the School District in an East-West direction.

We are asking you to allow us to use your name and/or the name of your firm or organization in newspapers and other media to publicize the need for the Short Creek Valley Highway and your support for this project.

If you will permit The Short Creek Highway Project Committee to use your name please sign the form below and return it to the Committee.

Sincerely,

John Laslo
Short Creek Valley Highway Committee

An Editorial

Worthy Project

RENEWED ACTIVITY toward the construction of an improved 17 mile highway extension from U.S. 250 near Cadiz through Fox's Bottom area, to Adena and Dillonvale and on to the Ohio River is timely.

The Jefferson County Planning Commission and the mayors and officials of Yorkville, Adena, Rayland, Tiltonsville and Martins Ferry should be commended for reinitiating the project.

THE SAME effort took place several years ago. Only then it was in the form of relocating U.S. 250 from Cadiz. That effort ended up in a hearing contested by another group which wanted 250's relocation to follow a path adjacent to Ohio 9 from Cadiz to St. Clairsville. The hearing resulted in a decision in favor of the latter. Despite the decision, however, 250 has not been relocated.

SINCE THAT time, two things have occurred to make an improved Cadiz-riverfront road through Adena and Dillonvale more timely. The first is the relocation and construction of a four-lane Ohio 7 which has opened up potential industrial sites along the river and in the Short Creek watershed area. And the second is the increasing importance of the Ohio River.

Annually, transportation tonnages on the river increase because it is the most cost efficient of transportation. Today imported raw material from all over the world flow to industrial plants by way of the Ohio River; likewise, exports both domestic and foreign flow out on the same river.

Access to the resources, including coal and potential industrial land sites, of the Eastern Ohio heartland through an improved Short Creek highway would help the area significantly.

The Honorable Richard F. Celeste
Governor of Ohio
State House
Columbus, OH 43266-0601

Dear Governor Celeste:

The Buckeye Local School District is moving forward in Eastern Ohio. In September, 1990, we will move nearly one thousand 9th, 10th, 11th and 12th grade students into a new State of the Arts High School. This is a dream come true for many of us and our parents before us, who have worked for over twenty-five years to make it a reality.

The new high school is located outside of Connorville on Route #150. We will bus students to the school from Adena, Dillonvale, Smithfield, Mt. Pleasant, Brilliant, Rayland, Tiltonsville and Yorkville.

My concern rests with the safe transportation of our children to the new high school. We desperately need a modern updated highway into the new Buckeye Local High School. As well as bussing a thousand students to and from this school daily, we will have continuous runs traveling Route #150.

I know you hear from people every day that say our Valley here in Eastern Ohio is dying. With the passage of our bond issue, Wheeling Pittsburgh Steel coming out of bankruptcy, and the new Tidd Demonstration Project in Brilliant, I feel we are just beginning to live again.

The Ohio Valley is a beautiful safe place to raise a family. There are acres and acres of land in our area that could be developed. We have a chance to survive if Ohio cares.

Please consider giving your support to a new highway through the Shortcreek Valley. The people of the Ohio Valley need a positive break. The children of the Buckeye Local School District need a safe modern highway to travel to school and home again each day. We need for someone to support Eastern Ohio and the people who are trying so hard. We border West Virginia and Pennsylvania. Our Valley could be a very inviting place to live - if people could only get here safely and in a reasonable amount of time. Our children and our Valley need your recognition and support.

Sincerely,

Anne Stephens

October 3, 1989

Mr. William McKenna
Mr. Rodney Wilson
Ohio Department of Transportation
P. O. Box 351
New Philadelphia, OH 44663

Dear Mr. McKenna and Mr. Wilson:

I am in receipt of your letter of September 29, 1989, concerning anticipated traffic flow to the new Buckeye Local High School.

Our study indicates the following increase in traffic along Routh #150, entering and leaving the high school beginning in late August, 1990:

Student Traffic	100 cars daily - about 60 will come from the West area and 40 from North and South Students on the OWE and DH Work Programs will enter and leave more than once per day
Bus Traffic	17 buses daily - all will enter at County Road #14 and exit onto Route #150 from the West driveway
Deliveries	UPS, Food to Cafeterias, Supplies - at least 4 to 5 trucks daily
Cafeteria	We anticipate 3 food trucks to deliver prepared food to other schools in the District
Sports Programs	In 1990, all baseball, softball, basketball games will be held at the new high school. The gym seats 2100 people and will be open for tournaments and hopefully some regional competition. During basketball season we anticipate over 1000 fans in attendance
Ohio University Jefferson Tech College	Evening classes will be held throughout the school year. This should bring at least 50 cars to the school three evenings per week
Adult Basic Education	Classes will be held from October through April two evenings per week. Anticipated attendance will be 50 persons

Parents Visiting School	Daily, it is anticipated that at least 75 cars will enter the school area other than those regularly scheduled. Parents will be picking students up from events and from regular school classes
Visiting Teams	Team buses will enter the school area almost daily for volleyball, basketball, baseball and softball games

The school will be open from 6:45 a.m. until 10:00 p.m. almost daily. The traffic flow coming from the West, South and North areas will be increased greatly. If you visit North H. S. and SouthWest H. S. now, you would see a steady flow of buses and cars transporting students and teams.

Should you have additional questions or need more information, please contact me.

Sincerely,

Anne Stephens

JEFFERSON COUNTY SCHOOL DISTRICT

2023 SUNSET BOULEVARD STEUBENVILLE, OHIO 43952

Craig A. Closser, *Superintendent*
Phone: (614) 283-3347

July 11, 1990

To Whom It May Concern:

The purpose of this letter is to support the proposed Short Creek Valley Highway. This highway would extend from Cadiz to Rayland, Ohio.

The proposed highway is vital to insuring the safe transportation of the nearly 2000 students transported daily to and from schools in the consolidated Buckeye Local School District. Buckeye Local, located predominantly in southern Jefferson County, also includes the Northeastern portion of Belmont County and an eastern portion of Harrison County. Prior to 1966, this area had seven (7) independent local school districts with seven (7) high schools and an enrollment of nearly 5300 students. In September of this year, Buckeye Local will open a new eleven (11) million dollar consolidated high school to serve this area. Consequently, safe transportion will be more important than ever.

Declining enrollment in the school district, because of the high unemployment in the region, has had a serious affect on the quality of education. This critical problem can be curbed with an improved highway which undoubtedly will stimulate economic development. With an expanding economic base, the region will experience a stemming of the out migration of young people.

The proposed Short Creek Valley Highway is a vital key to safe transportation and to positive economics in the area. I, therefore, support its development.

Yours truly,

Craig A. Closser

Local mayors continue to push for new highway construction

3-12-90

BRIDGEPORT — Local mayors hope to schedule a meeting soon with state officials to continue discussions about the Short Creek Highway project.

Plans for a new highway along U.S. 36 were discussed by local mayors at Saturday's meeting of the Eastern Ohio Mayors' Association.

The Short Creek Highway project calls for a new highway to be built along U.S. 36 and a bridge to be contructed between Rayland and Short Creek, W.Va., located below Beech Bottom.

Supporters of the highway project believe it would help the economy of the area. Mayor's Association President Charles Furbee of Bridgeport said the highway would "help to get the coal in and the steel out" to other parts of the country.

Furbee called the project a "great asset to the Ohio Valley area."

It was also pointed out that a new highway would make travel for students at the new Buckeye Local High School safer.

Spearheaders of the project, John Laslo and Martin McKim, will travel to Columbus to meet with legislators and officials from the Ohio Department of Transportation to discuss the highway proposal. No definite date for the meeting has been determined.

On hand for Saturday's meeting were mayors, concerned citizens, chamber of commerce representatives and school officials from Buckeye Local, Yorkville, Adena, Mt. Pleasant, Smithfield, Morristown, Dillonvale, Martins Ferry, Bridgeport, Tiltonsville, Barnesville and Warren Township.

Congressman Douglas Applegate, D-Steubenville, state Sen. Robert Burch, D-Dover, state Rep. Jack Cera, D-Bellaire, and state Rep. Jerry Krupinski, D-Steubenville, also attended the meeting.

"It is a good time to strike for the building (of the new highway,)" Applegate said.

He said he would push for federal funding of the project and added that plans for a new highway have been in the works since the early 1960s.

Applegate pointed out that $11 billion in highway gas tax funds are available for such an undertaking and estimated that if the highway is built, 90 percent of the cost will be borne by the federral government and the state will supply the other 10 percent.

Times Leader 2-7-89

Population loss

ACCORDING TO the Ohio Department of Employment Services, Eastern Ohio, the counties of Belmont, Jefferson, Harrison and Monroe, suffered a major decline in population between November and December.

Figures used by the state agency in reporting labor force estimates and unemployment rates estimated a total of 1,800 fewer residents in the four counties in December than in November.

Included was the loss of 400 people in Belmont, 300 in Harrison, 800 in Jefferson and 300 in Monroe.

The state estimate of population decline in the area is bad enough, but when the statistics indicate that most of those no longer in the local labor force had been recorded as employed in the November estimates, it raises serious concerns.

The estimates for Belmont County in December showed 600 fewer people working but only 200 additional unemployed when compared to November figures, while Harrison, Jefferson and Monroe Counties had their population declines represented in those employed, with the number of unemployed remaining the same as the previous month.

ACTUALLY, the change in numbers appears to be only an adjustment on the part of the OBES as the loss of population, as indicated by the number in each county's labor force, a total of those working and those listed as unemployed, is general for each area in the report.

However, there was no explanation included with the state release, which might lead some prospective employers to decide Ohio is a dying state, not a growing business area as our political leaders claim.

Across Ohio, the estimate in December was a labor force of [illegible], down from November's [illegible]. Given the fact that population figures, either estimates or from the last census, are often used by bureaucrats for dissemination of money or programs, we question the changes in Ohio's population on official reports without some explanation.

YOUR VIEW

Times Leader

10-31-90

Repayment due to Eastern Ohio

A federally constructed highway has been proposed for the Short Creek Valley. This highway would run from Cadiz through Adena and Dillonvale to Route 7 in Rayland. The construction of this highway has been endorsed by all of the mayors and councilmen of the villages in the area. Most businesses and organizations have endorsed it also. What is also needed is for everyone in the area to get behind the project. Everyone could help by talking to your elected officials and anyone running for office, writing letters to your elected officials, attending Short Creek Highway meetings, and circulating petitions in favor of the construction of the highway.

This highway could help bring some new industries and businesses to this depressed area, which would mean more jobs. Then instead of our young people having to leave the area for work, they would have jobs here. The most important assets we have are our young people. Why not keep them here and bring this valley back to being prosperous as it was for so many years before?

We have contributed a great deal to this wonderful state and now it is time our elected officials to do something for this area.

TESTIMONY OF MR. THOMAS J. LAUGHMAN GIVEN MONDAY JULY 16, 1990 BEFORE THE PUBLIC WORKS AND TRANSPORTATION COMMITTEE OF THE UNITED STATES HOUSE OF REPRESENTATIVES

GOOD MORNING, GENTLEMEN OF THE PUBLIC WORKS AND TRANSPORTATION COMMITTEE.

MY NAME IS THOMAS LAUGHMAN, PRESIDENT OF THE GUERNSEY COUNTY BOARD OF COMMISSIONERS. ITS MY GREAT PLEASURE TO APPEAR BEFORE YOU THIS MORNING, TOGETHER WITH MY FELLOW GUERNSEY COUNTY COMMISSIONERS, BUD LARRICK AND JEREMY BROCKWELL.

IT IS OUR UNDERSTANDING THAT THE PURPOSE OF THIS HEARING IS TO ASSIST THE COMMITTEE IN ITS INVESTIGATION OF THE NEEDS OF THE NATIONS INFRASTRUCTURE.

AS COMMISSIONERS OF GUERNSEY COUNTY, OHIO, WE DO NOT FEEL WE ARE QUALIFIED TO ADDRESS THE GENERAL NEEDS OF THE NATIONS INFRASTRUCTURE. HOWEVER, WE FEEL WE ARE QUITE WELL QUALIFIED TO ADDRESS THIS COMMITTEE CONCERNING THE NEEDS OF A RURAL COUNTY, FACING THE PROBLEM OF A DETERIORATING INFRASTRUCTURE AND THE LACK OF MEANS TO ADDRESS THAT PROBLEM. NOT ONLY DO WE IN GUERNSEY COUNTY HAVE A PROBLEM WITH MAINTAINING EXISTING INFRASTRUCTURE, WE ARE ALSO FACED WITH AN ERA OF MANDATES IN WHICH AUTHORITIES OF THE STATE AND FEDERAL GOVERNMENTS REQUIRE US TO MAKE LARGE ADDITIONS AND IMPROVEMENTS TO OUR INFRASTRUCTURE, FOR WHICH WE FACE THE SAME PROBLEM OF A LACK OF ADEQUATE FINANCING.

THE FIRST PARTICULAR ITEM OF INFRASTRUCTURE THAT I WOULD LIKE TO ADDRESS, IS ONE WHICH THE PEOPLE OF RURAL COUNTIES, LIKE

GUERNSEY COUNTY, OHIO, ARE ACUTELY AWARE OF. THE PROBLEM OF WHICH I SPEAK IS THE MAINTENANCE AND IMPROVEMENT OF A COUNTY ROAD SYSTEM.

GUERNSEY COUNTY, OHIO, PRESENTLY MAINTAINS 408 MILES OF COUNTY ROADS, 380 BRIDGES, AND DITCHES AND CULVERTS TOO NUMEROUS TO LIST HERE TODAY. AT THE SAME TIME, WE MUST PROVIDE FOR THE MAINTENANCE OF THIS EXTENSIVE SYSTEM OF ROADS AND BRIDGES WITH FUNDS DERIVED ALMOST EXCLUSIVELY FROM TAXES ON GASOLINE AND LICENSE TAGS.

THE PRESENT BUDGET FOR GUERNSEY COUNTY'S HIGHWAY DEPARTMENT IS APPROXIMATELY $2,260,000.00 OF WHICH ABOUT $890,000.00 IS DERIVED FROM THE GAS TAX AND $1,200,000.00 IS DERIVED FROM THE LICENSE TAG TAX.

THE GAS TAX IS COLLECTED BY THE STATE AND FORTUNATELY IS DIVIDED EQUALLY AMONG OHIO'S EIGHTY-EIGHT (88) COUNTIES. UNFORTUNATELY HOWEVER, THE LICENSE TAG TAX IS DIVIDED AMONG THE COUNTIES IN PROPORTION TO THE NUMBER OF TAGS SOLD IN EACH PARTICULAR COUNTY. THE RESULT IS A GLARING DISPARITY BETWEEN THE AMOUNT OF MONEY A RURAL COUNTY IS GIVEN TO MAINTAIN ITS ROADS AND BRIDGES COMPARED TO THE AMOUNT OF MONEY GIVEN TO URBAN COUNTIES TO MAINTAIN THEIR COUNTY SYSTEM OF ROADS AND BRIDGES. FOR EXAMPLE, AS I HAVE ALREADY MENTIONED, GUERNSEY COUNTY MAINTAINS 408 MILES OF COUNTY ROAD, 380 BRIDGES WITH A BUDGET OF $2,260,000.00 DOLLARS. IN COMPARISON, CUYAHOGA COUNTY WHICH HAS ONLY 40 MILES OF COUNTY ROAD TO MAINTAIN HAS TENS OF MILLIONS OF DOLLARS WITH WHICH TO MAINTAIN THOSE ROADS, BECAUSE THEY SELL

HUNDREDS OF THOUSANDS MORE LICENSE TAGS IN CUYAHOGA COUNTY THAN IN GUERNSEY COUNTY.

WE, GUERNSEY COUNTY COMMISSIONERS TOOK THE POLITICALLY RISKY STEP OF IMPOSING AN ADDITIONAL FEE ON THE COST OF LICENSE TAGS. BUT EVEN THIS GENERATES ONLY A SMALL AMOUNT OF ADDITIONAL REVENUE FOR THE MAINTAINENCE AND IMPROVEMENT OF COUNTY ROADS.

ALSO, STATE ISSUE 2, OHIO'S INFRASTRUCTURE BOND FUND HAS PROVIDED US WITH SOME SMALL RELIEF FOR OUR INFRASTRUCTURE FINANCING NEEDS, SOME OF WHICH WE USE ON COUNTY ROADS. THE PROBLEM REMAINS, HOWEVER, THAT RURAL COUNTIES LIKE GUERNSEY COUNTY, OHIO ARE FACED WITH THE PROBLEM OF MAINTAINING AND IMPROVING HUNDREDS OF MILES OF COUNTY ROADS WITH FUNDS GROSSLY INSUFFICIENT FOR THE TASK.

IT IS ALSO IMPORTANT TO SEE THE PROBLEM OF MAINTAINING A COUNTY ROAD SYSTEM FROM THE HUMAN PERSPECTIVE. THE PEOPLE OF GUERNSEY COUNTY DRIVE TO AND FROM WORK AND THEIR RECREATION AND TO AND FROM CHURCH AND TO AND FROM THE MANY HUNDREDS OF ACTIVITIES THAT PEOPLE ARE INVOLVED IN ON A COUNTY ROAD SYSTEM THAT IS BUMPY, AND OFTEN UNSAFE. THIS PROBLEM AFFECTS DIRECTLY THE QUALITY OF LIFE OF THE PEOPLE OF GUERNSEY COUNTY.

ANOTHER PROBLEM FACING RURAL COUNTIES, LIKE GUERNSEY COUNTY, OHIO IS THAT OF DELIVERING SAFE, QUALITY DRINKING WATER TO OUR RURAL CONSTITUENTS. PRESENTLY IN GUERNSEY COUNTY THERE ARE NUMEROUS VILLAGES AND HUNDREDS OF RURAL FAMILIES IN THE UNINCORPORATED AREAS WHO HAVE WATER WHICH IS DISTASTEFUL AND UNSANITARY, AND INADEQUATE IN SUPPLY. EVERYDAY WE HEAR FROM CITIZENS WHO RIGHTLY COMPLAIN THAT THEY HAVE A LACK OF WATER.

OR POOR QUALITY WATER FROM THEIR WELLS. WE AGREE WITH THEM, THAT IN MODERN AMERICA NO ONE SHOULD GO WITHOUT AN ADEQUATE SUPPLY OF SAFE DRINKING WATER. THE PROBLEM IS, HOW DOES A RURAL BOARD OF COMMISSIONERS FINANCE THE MILLIONS OF DOLLARS THAT IT COSTS TO EXTEND SAFE DRINKING WATER TO THE PERIPHERY OF THE COUNTY?

WE UNDERSTAND THAT THERE ARE PRESENTLY BILLS BEFORE THE CONGRESS TO PROVIDE FUNDS TO STATE GOVERNMENT WITH WHICH TO CREATE REVOLVING LOAN POOLS FROM WHICH COUNTIES MAY BORROW AT LOW INTEREST RATES TO FINANCE PROJECTS TO PROVIDE SAFE DRINKING WATER TO THEIR CONSTITUENTS

WE SUPPORT THESE PROPOSALS AND WOULD LIKE TO SEE FEDERAL FUNDING IMPROVED AND EXTENDED. IN ADDITION WE WOULD LIKE TO SEE THE FEDERAL GOVERNMENT GO BEYOND PROVIDING FUNDS FOR REVOLVING LOAN POOLS, TO PROVIDING GRANT FUNDS AS WELL. ONLY IN THIS WAY CAN THE COST OF RUNNING LONG LINES IN RURAL AREAS BE MADE AFFORDABLE TO THE CUSTOMERS OF RURAL WATER SYSTEMS. EVEN WITH LOW INTEREST, BORROWING MONEY TO PAY FOR RURAL WATER SYSTEMS IS UNAFFORDABLE WHEN THE COST OF REPAYING THOSE LOANS MUST BE COLLECTED FROM THE FEES THE CUSTOMERS PAY FOR THE WATER THAT THEY USE. ONLY A COMBINATION OF LOW INTEREST LOANS AND GRANT MONEY, WHICH NEED NOT BE REPAID, CAN POSSIBLY SOLVE THE PROBLEM OF MAKING SAFE DRINKING WATER AVAILABLE AND AFFORDABLE FOR OUR RURAL CONSTITUENTS.

A THIRD PROBLEM THAT WE FACE IN GUERNSEY COUNTY IS THAT OF WASTE WATER TREATMENT. RECENTLY, WITH THE ASSISTANCE OF OUR HEALTH DEPARTMENT, WE COMPILED A LIST OF WHAT WE REFER TO AS

"HOT SPOTS" - THOSE RESIDENTIAL POCKETS AND COMMUNITIES IN GUERNSEY COUNTY THAT ARE IN NEED OF WASTE WATER TREATMENT. THAT LIST PRODUCED MORE THAN 25 "HOT SPOTS" AND I KNOW THAT THERE ARE OTHER AREAS IN GUERNSEY COUNTY THAT WE HAVE NOT COUNTED.

RECENTLY, THE OHIO ENVIRONMENTAL PROTECTION AGENCY MANDATED THAT WE INSTALL SEWER SYSTEMS IN TWO COMMUNITIES IN THE UNINCORPORATED AREAS OF GUERNSEY COUNTY.

THE GUERNSEY COUNTY COMMISSIONERS DID NOT OBJECT TO THESE MANDATES BECAUSE ESSENTIALLY WE AGREE THAT THE NEED TO PROVIDE SEWER TO THESE TWO PARTICULAR AREAS EXIST. IN FACT, AS I HAVE ALREADY MENTIONED MANY MORE THAN THESE TWO AREAS ARE IN NEED OF SEWER IN GUERNSEY COUNTY. WE ARE PRESENTLY INVESTIGATING THE MEANS BY WHICH GUERNSEY COUNTY WILL FINANCE THE INSTALLATION OF THESE TWO MANDATED SEWER PROJECTS. WE FEEL THAT WE DO HAVE THE BONDING CAPACITY TO FINANCE THE~~SE TW~~O PARTICULAR PROJECTS. THE QUESTION REMAINS, HOWEVER, HOW WILL GUERNSEY COUNTY FINANCE THE MANDATES WHICH ARE SURE TO COME IN THE FUTURE TO PROVIDE SEWER TO THE OTHER AFFECTED AREAS IN OUR COUNTY, WHEN OUR BONDING CAPACITY HAS BEEN USED UP?

ON ANY WARM DAY, A PLEASANT DRIVE THROUGH RURAL GUERNSEY COUNTY WILL BE INTERRUPTED MORE THAN ONCE WITH THE UNPLEASANT SMELL OF UNTREATED SEWAGE. AGAIN, AS I MENTIONED IN RELATION TO SAFE DRINKING WATER, WE FEEL THAT NO CITIZEN OF MODERN AMERICA SHOULD BE COMPELLED TO LIVE WITHOUT ADEQUATE WASTE WATER TREATMENT. THE HEALTH AND QUALITY OF LIFE OF OUR CITIZENS DEMANDS THIS. THE GUERNSEY COUNTY COMMISSIONERS WOULD SUPPORT ANY EFFORT BY THE CONGRESS TO PROVIDE FEDERAL AID TO THE STATE AND LOCAL

GOVERNMENTS TO ASSIST IN MAKING SEWAGE TREATMENT AFFORDABLE AND AVAILABLE TO EVERYONE.

AGAIN, ON BEHALF OF MY FELLOW GUERNSEY COUNTY COMMISSIONERS, BUD LARRICK AND JEREMY BROCKWELL, I'M TOM LAUGHMAN AND I WOULD LIKE TO THANK THE MEMBERS OF THE COMMITTEE FOR THEIR PATIENCE IN HEARING ME TODAY.

Public Works and Transportation Committee

Honorable Glenn Anderson, Chairman

Hearing on Infrastructure
St.Clairsville, OH 43950
July 16, 1990

Testimony of Donald Myers
Director of Development
Community Improvement Corporation

Infrastructure Funding

Recently our office compiled a list of infrastructure needs for Belmont County. That list exceeded 175 million dollars with the completion of State Route 7 using 70 million dollars. Our County has 78,200 people and nearly half are without sewerage and nearly 25% without adequate water supply.

It is difficult to speak of new development of infrastructure when much of existing infrastructure is in such need of repair.

Our largest industry within Belmont County is Wheeling Pittsburgh Steel Corp. which employees over 600 people. This industry located in Martins Ferry, Ohio uses nearly 25 million gallons of water monthly. The water lines that feed this plant are nearly 80 years old. Average unemployment in the 18th district is 7.5%. We cannot afford to lose existing jobs because of insufficient existing infrastructure. If we expect to compete in the global world we must have federal funds for infrastructure.

On December 21, 1987 the Belmont County Commissioners purchased a 158 acre tract of land, 400 yards north of Interstate 70, for the purpose of developing an Industrial Park. During the past two and a half years five potential developers have looked at the site and all have said no because the site lacks water, sewer and roadway into the park. Very few counties have the financial resources to develop green fields. Federal programs must be available if this industrial park is to succeed.

Closing: The Federal Government has drastically reduced the amount of money available for economic development projects. Programs such as UDAG, ARC, EDA and FmHA have either been eliminated or greatly reduced. The Federalism program has put financial strain on both State and Local government. It is my honest feeling that this Public Works and Transportation Committee under the direction of Chairman Glenn Anderson plays the most important role to economic development growth and recovery.

United States House of Representatives
Committee On
Public Works and Transportation

Hearing:	St. Clairsville, Ohio
Date:	July 16, 1990
Testimony:	Daniel L. Neff, Economic Development Specialist Ohio Mid-Eastern Governments Association Cambridge, Ohio 43725

Thank you for this opportunity to testify about such a vitally important topic: the future of our nation's infrastructure. During the time allotted to me, I would like to briefly touch upon three significant areas of concern that I have in relation to this topic:

- the importance of adequate infrastructure in the economic development process
- the financial and technical limitations of many rural local governments
- the growing infrastructure crisis facing our country

The Importance of Adequate Infrastructure in the Economic Development Process.

The phrase "economic development" has a fairly generalized meaning and is used in connotation with almost anything that involves the employment base of an area. However, at the heart of any local economic development plan is the need for adequate infrastructure. Good highways and water and sewer systems with the capacity to handle increased loads are often key factors in attracting new industries to an area.

Federal programs such as the Economic Development Administration (EDA) and the Appalachian Regional Commission (ARC) recognize this linkage and were, in fact, created with infrastructure development being the major priority. In my role as an Economic Development Specialist with the Ohio Mid-Eastern Governments Association (OMEGA), I work with nine counties in the Appalachian region of Ohio. This has given me the opportunity to see just how effective both EDA and ARC have been in providing infrastructure development that creates jobs (despite the substantial budget cuts of the past decade.)

Funds from these programs have been essential in creating and retaining thousands of jobs in the nine-county OMEGA District alone. These projects have included such activities as industrial park development, downtown improvements, and the creation of regional shopping malls. They have not only provided the impetus for creating employment but have also played a significant role in improving the quality of life for area residents. While we are still considered to be a part of an economically distressed region, it is painful to imagine just how much worse the situation would be without these programs.

At the state level, there is also recognition of the special infrastructure needs of Appalachian counties. During recent forums conducted in southeastern Ohio by Ohio Department of Development Director David Baker and Governor's Office of Appalachia Director Randy Runyon, testimony was provided by local officials, area residents, and development personnel. Perhaps the most talked about issue at these meetings concerned the need for adequate infrastructure to encourage local economic development.

As a result of the input provided at these forums, a special report highlighting the needs of Ohio Appalachia was released. One of the primary strategic goals of this report is to "improve the region's ability to attract new firms by investing in infrastructure important to industry and increasing the region's ability to recruit new firms." In order to accomplish this, the Department of Development plans to:

* initiate a pilot speculative industrial building project
* develop a low interest, principal deferable, loan program for water and sewer extension to green field sites
* encourage the implementation of key highway projects in the region

The Financial and Technical Limitations of Many Rural Local Governments

A recent article in the New York Times examined the increasing difficulty of governing in small town America. It pointed out that many small local governments do not have the manpower, expertise, or financial capability to meet the growing responsibilities placed upon them by the state and federal governments.

While the Regan Administration emphasized decentralization, it also drastically cut funding for agencies whose programmatic directives were now to be carried out by local government. In addition, the General Revenue Sharing program was not re-enacted by Congress, thereby eliminating for many local governments their primary source of federal aid. This, coupled with increased federal and state regulatory requirements and declining tax bases (due to population losses) have left local officials struggling to find solutions to their growing list of problems.

A good example of this problem can be seen by examining the various health and environmental mandates being given to local governments to improve their present water and/or sewage systems. While a number of laws have been passed to improve standards, not nearly enough funds have been appropriated to complete the task. As a result, local governments often have to drag their feet (and face severe financial penalties) simply because they do not have the financial capability or expertise needed to comply.

The Growing Infrastructure Crisis Facing Our Country

During this hearing and others like it, this Committee has heard the call from concerned citizens and public officials about the need of the federal government to do more to preserve our nation's infrastructure. Numerous studies have shown that our highways and bridges are deteriorating and that our water and sewage systems just don't meet proper standards.

While the federal government can surely not solve the problem alone, neither can it completely back away and leave it up to the state and local governments to develop policy. The difficult task is determining what exactly should be done to deal with this issue, for money alone will not solve the problem. I urge this Committee to take the steps necessary to establish a national infrastructure priorities system and to do all it can to insure that necessary funds are appropriated.

We all know that this problem is not simply going to go away. It behooves all three levels of government to reestablish and strengthen the intergovernmental linkages necessary to meet this head on; in a timely fashion before the situation worsens.

In conclusion, I would like to commend this Committee for its efforts in keeping programs like ARC and EDA functioning, and encourage it to do all that can be done to increase appropriations to previous levels. (As indicated in Exhibit "A", the National Association of Development Organizations estimates that, when adjusted for inflation, federal rural and economic development programs have been cut more than 70 percent since 1908.) It is programs like these that can do much to help alleviate our national infrastructure problem.

Exhibit "B" provides a long list of the infrastructure needs for just OMEGA's nine counties. Similar needs exist across the country. With that in mind, I encourage this Committee to do all it can to insure that this growing problem is met in a decisive way. Thank you.

June 26, 1990

Editor
The New York Times
229 West 43rd Street
New York, New York 10036

Dear Editor:

Congratulations to the Times for identifying in "Strains of Governing Small Towns," (June 25) the problems facing rural governments. Throughout the country small towns, cities and counties are struggling to provide services to more than 65 million rural Americans. As your article pointed out, these rural governments face increased mandates with little or no help from the federal government.

When adjusted for inflation, federal rural and economic development programs have been cut more than 70 percent since 1980. First President Reagan and now President Bush have consistently sought to eliminate the few remaining programs which help rural governments with infrastructure and economic development, such as the Economic Development Administration.

While 20 percent of the urban population lives in poverty, 34 percent of all rural people are poor. Experts call attention to the problem of a bi-coastal economy, but in most states there is an expanding metropolitan economy and a declining rural one. As jobs and people leave rural communities, the ensuing urban overload will only increase the crises in our nation's big cities.

Your article makes clear that the days of the part-time, volunteer rural government manager are fast disappearing. The plain truth is that many rural communities need additional assistance to cope with increasing mandates as well as the provision of basic services. As the federal government continues to back away from the intergovernmental partnership, a regional approach to problem-solving becomes even more vital to the survival of rural America. We cannot give up on small town government, nor can we allow the federal government to forgo its responsibilities to serve the 25 percent of U.S. citizens still living in rural communities.

Sincerely yours,

Aliceann Wohlbruck

Explanation of Priority Rankings

Priority 1	An Immediate Need
Priority 2	Needed within two to three years
Priority 3	Needed within four to six years

HONORABLE BOB OLEXO
BELMONT COUNTY COMMISSIONER

INFRASTRUCTURE NEEDS
OF
BELMONT COUNTY

July 16, 1990

In order to serve the needs of the citizens of Belmont County, we have prepared a listing of some of our main infrastructure needs. These needs are primarily in the areas of water line facilities, sewers, bridges and roads. Our cities, villages and sixteen townships also have additional need for funding, but this report will concentrate on the overall infrastructure needs of Belmont County.

A. Relocate State Route 7 through Bellaire, Ohio. Present road winds through a large section of the downtown area, with numerous turns, traffic lights and bottlenecks. Present situation is a major problem for residents of Bellaire plus travelers of State Route 7, which is a major North/South artery of the heavily populated eastern portion of the county.

B. Establishment of a Port Authority for Belmont County. This agency would actively oversee the location of business and industry within Belmont County, thus creating much needed jobs within the area.

C. Construction of an access road(s) plus sewer facilities into the Industrial Park Complex in the Route 331 area. The roads and sewer facilities are urgently needed to attract light industrial firms to relocate into this area. These firms would also create employment.

D. Construction of road and sewer facilities into the new county jail site. Land has been designated for the construction of a new jail and detention facility. Present facility is approximately 100 years old and vastly out of compliance with state and federal regulations. The installation of road and sewer facilities would expedite the construction of this much needed facility.

E. Relocating of State Route 800 running north and south from I-70 through the Barnesville area. The present road winds and twists through the downtown area of Barnesville. The relocating of this highway would act as a better link in connecting traffic with the east/west flow of I-70.

F. Develop the area around Exit 208 of I-70 in the Morristown area. This is an excellent area to attract small business and light industry, with easy access to I-70.

G. Numerous additions and updating of the County Water and Sewer system. The Belmont County Sanitary Sewer District improvement and expansion is the key to the future development of commercial, industrial and residential areas of Belmont County. Currently the District has reached its maximum out-put potential in water production and distribution.

With the added demand for our service, water distribution and collection systems are an integral part for future development of Belmont County.

The District has a potential of treating three (3) million gallons of water per day, but can only distribute two (2) million per day with existing system. The water system has been evaluated by a professional engineer with the following recommendation and cost involved to increase production to meet future needs of the County.

1. Phase I Water System Improvement would consist of the installation of a 24" water line from the Water Plant to Neffs area and construct a two (2) million gallon water storage tank on State Route 331 to serve the Western part of Belmont County. The estimated cost is $2,600,000.00.
2. Phase II Water System Improvement would be the construction of a 24" water line from Neffs to State Route 9 South of St. Clairsville. Water Treatment Plant expansion to increase the treatment capacity to six (6) million gallons per day, estimated cost $ 4,900,000.00.
3. Well and pump renovation to increase the potential to pump raw water from the well to the Water Plant, estimated cost $ 700,000.00
4. Many residents of Belmont County must rely on wells and/or springs for their domestic water supplies. To extend water into the various areas of Belmont County the cost would be $3,000,000.00

   The Belmont County Sanitary Sewer District presently has only one source of obtaining funds to institute the water projects. The Farmers Home Administration has provided grants and loans in the past, however, with current guide lines of gross family income of $16,800, the District would not qualify for future grants and the loan program is a very slow procedure to initiate and too costly for the current water users to finance.

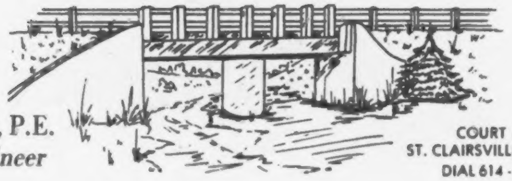
   Currently all sewer systems are on site disposal systems and have the potential for extreme stream pollution. The District has explored various funding sources to install collection systems and waste water treatment plants in various areas of Belmont County, but to date all systems are too costly for consumers.
5. The Fox Shannon Service Plant and Collection would service existing County, State and Federal facilities. The cost would be $1,200,000.00. With the cost to treat

and maintain the system the customer could not afford the facility without grant money that could be used for construction.

6. The area of Belmont County from St. Clairsville West to Morristown (I-70 and SR 40) has the potential for greatest development. The area does not have any type of central sewer system. Therefore, all the areas have on site sewer treatment. The system would cost $5,500,000.00.
7. Other areas of Belmont County that are currently in need of a central collection system and treatment facility include the Neffs area - $2,000,000.00 and Wheeling Creek area - $ 8,000,000.00. The area is currently served by septic tanks and/or discharged directly into the creeks.

To improve the water system to meet current and future needs the cost would be $11,200,000.00. The development of a central sewer system would be valued at $16,700,000.00.

H. County roads and bridges. See attached report from Belmont County Engineer Fred F. Bennett, P.E.



FRED F. BENNETT, P.E.
Belmont County Engineer

COURT HOUSE
ST. CLAIRSVILLE, OHIO 43950
DIAL 614 - 695-2121

July 16,1990

In late 1985 the County Engineers Association of Ohio began a study to determine if there were any needs in the County highway system within the state of Ohio. The study was divided into five sections which included Ohio county needs in comparison to other counties in other states, Revenue shrinkage due to inflation, Needs based on pavement management studies underway in selected counties, Roadway needs as expressed by County Engineers for their particular county,and The condition of bridges that are the county's responsibility.
The comments in this presentation are directed to the needs of Belmont County, what accomplishments can be achieved in meeting these needs and what Belmont County has done in attempt to provide funding for infrastructure improvements.

Belmont County has 297 bridges, of these 297 bridges, 259 are deficient, this is an 80% deficiency.In order to correct the bridge deficiency in Belmont County 22.4 million dollars is needed. If we compare O.D.O.T. bridges to County bridges we find that O.D.O.T. has 19,000 bridges compared to a total of 27,000 bridges in the counties throughout the state.Other statistics will show that there are
40,000 Miles of Township Roads in Ohio
30,000 Miles of County Roads
19,000 Miles of State Roads
23,000 Miles of City Roads
1,000 Miles of Park Roads

In 1987 the Counties were alloted 440 million dollars to maintain 30,000 miles of roads,compared to O.D.O.T.'s 1989 budget of 1.1 billion to maintain 19,000 miles of state roads.

There are 42,688 bridges in the State of Ohio and we are the second largest bridge statein the nation. Texas is number one.

Of the 42,688 bridges in our state, 27,000 are county bridges, that's more than 60%.

It is estimated that the cost to replace the deficient bridges in Ohio would be 2.2 billion dollars, and 1.7 billion is needed to upgrade county highways.

Recently the State of Ohio provided funding through Issue II to assist with the infrastructure problem, however this has provided only 2 to 3 percent of the needed funding for infrastructurepurposes.

Belmont County has incorporated a license fee to help defray some of the cost involved in highway and bridge maintenance.

With the declining economy in Belmont County and the loss of our basic steel and

DIAL 614 - 695-2121

coal industries we are experiencing a higher rate of unemployment in our population.

Belmont County decreased in population from 82,000 to 78,000 which is indicative of the fact our young citizens are leaving the area.

Belmont County's economic growth will depend largely upon local government's ability to improve roads and bridges. It is extremely difficult to maintain roads and bridges, perform snow removal in winter,which increases our labor costs due to overtime and the need to purchase necessary snow removal equipment and material with our present local available funding.

A 25% cost share will surely place us in a position economically in which we no longer perform maintenance and repair services at our present level, and could result in a reduction of our man power level to recoup some loss of revenue.

Belmont County is in dire need of federal dollars for infrastructure work

Talking Points
U.S. Congressional Hearing

OHIO STATE REP. JOE SECREST
95th House District

July 16, 1990

* Public works projects are critical to the 95th House District. Our economic vitality and future growth depend on them.

* Solid infrastructure systems bring and maintain business and industry.

* Economic development is contingent on the environmental and transportation infrastructure of a community.

Transportation Perspective

1. rural economic development relies on an efficient transportation system.
2. Appalachia Ohio does not have the extensive highway system required for growth.
3. the mobility to ship goods and products, as well as people, is crucial for productivity and quality of life.
4. federal involvement through the Highway Trust Fund could provide assistance.

Environmental Perspective

1. adequate fresh water supply treatment and distribution systems.
2. waste water collection and treatment facilities.
3. sewer systems.
4. public health and safety: protection of surface water, ground water, and drinking water supplies.

* Realize the importance of helping oneself. Ohio has done that.

* Ohio Legislature sought and successfully implemented an innovative way to assist and work with local governments to finance public works projects through Issue 2.

* Issue 2 is a ten year, $1.2 billion program.

* One aspect of the program to consider when talking about Southeast Ohio: moneys are used primarily to rebuild and improve the existing infrastructure.

* As stated previously, this area needs assistance and commitment from the federal government regarding public works and infrastructure framework creation.

* Closing: Thanks to Congressman Applegate and committee members.

TO EXAMINE THE FUTURE OF OUR NATION'S INFRASTRUCTURE NEEDS

MONDAY, JULY 16, 1990

House of Representatives,
Committee on Public Works and Transportation,
Youngstown, OH.

The Committee met, pursuant to call, at 2:38 p.m., at the Operating Engineers Hall, 291 McClurg Road, Youngstown, Ohio, Hon. Glenn M. Anderson [Chairman of the Committee] presiding.

Present: Representatives Anderson and Traficant.

The meeting will come to order.

The Chairman. Good afternoon, the Committee on Public Works and Transportation hearing on the future of our Nation's infrastructure needs will come to order. I want to welcome you here today and to thank you for taking time from your busy schedules to share with us your concerns, knowledge and perspectives about this important issue.

This year, the Committee initiated a series of events designed to give us a better understanding about our Nation's infrastructure crisis. At our first event in Washington, we looked at emerging infrastructure needs from a national point of view. Our second and third events focused on the impact of infrastructure on the productivity, growth and ability of the United States to compete in international markets. Future events will include hearings on infrastructure financing alternatives and new technologies.

It is important, however, for us to get a good look at the infrastructure problems encountered at the local and state levels. Our meetings today, here in the Youngstown area this afternoon and this morning in St. Clairsville, are the first of several planned at various sites around the Nation. We want to review infrastructure needs with the people most directly involved and to hear a broad range of ideas that can help resolve the problems.

I am especially pleased to be here in Jim Traficant's District. I want to thank him and the people of the 17th District for their generous hospitality. In my view, Jim is one of the most intensely committed members of Congress. He is a vigorous fighter on your behalf. And while he has, by his own admission, put law enforcement and the war on drugs among his top priorities, I think he has also worked effectively on issues designed to help the handicapped, veterans, retirees, senior citizens, students and the unemployed. And Jim has also been very vocal in expressing his deep concern about this area's crumbling industrial economy. He has crusaded for "Buy American" legislation and trade reform and has consistently supported economic development initiatives that would help to diversify and rejuvenate the local economy. This year, he has been especially successful in legislating highway and water projects that will be a tremendous boost to the economy of this area.

As Jim knows, when we talk about infrastructure, we are talking about the very cornerstone of our cities and rural communities. Now it may not be an exciting subject, but it is infrastructure that provides the foundation for a sound economy and is at the very heart of our standard of living and quality of life that all Americans enjoy.

From our hearings thus far, we know that not only do many problems exist with our public works facilities, but we have been shortchanging our public works investments for more than 20 years. The question today is: What about Ohio's infrastructure? How inadequate is its network of public facilities—roads, bridges, public buildings, sewers, wastewater treatment facilities, water supply facilities, dams and other public works?

In addressing this, we should all keep in mind that economic research in recent hears has tied the level of public spending on infrastructure to the productivity growth rate in the private sector. The United States productivity growth rate fell from 1.8 percent annually in the 1960s to less than one percent, to seven-tenths of a percent in the early 1980s. During the same period, the annual growth rate of investment in infrastructure fell from 4.5 percent to .8 percent.

Productivity in our country is growing much more slowly than in other developed countries such as Japan, West Germany, Canada, France, Italy and the United Kingdom. Some of which, incidentally, invest almost twice as much in their public works as does the United States. In fact, our nation ranks 55th in the world in capital investment in infrastructure. That is shocking. We should be number one. I mentioned some of these countries that are spending twice as much and I mentioned Japan. Actually Japan last year spent five times as much, in that little country, as our whole United States did. I know when you look on a map and you see the whole nation of Japan alongside of the United States on the map, you can put it in my State of California and lose it. And then when you think that they spent, in that little country, five times as much as the whole United States spent for infrastructure, you realize why they are able to do so much competitively, because they are eliminating much of the congestion and things that are costing us so much money.

Anyway, we do look for your help to gain further insight on infrastructure needs. What is the condition, what your suggestions are and what the needs are to meet the anticipated needs of this area.

And who do you think should pay for the necessary public works and the financing techniques that we need? And what do you think the federal role should be? And the state role? The local role? And lastly, what should our Committee be doing to resolve some of these problems?

As we continue our inquiry and debate on how to deal with the current and anticipated needs of our public works, we look forward to your answers and to questions that you may raise.

We are going to first hear from a man you all know, he is the man responsible for our being here today, the Honorable Jim Traficant, your representative in the House of Representatives, and a knowledgeable and effective member of our Committee on Public Works and Transportation.

Sometime ago, Jim asked me to visit the 17th District, and since we were down in southeastern Ohio regarding the recent flooding and to look at infrastructure needs, it seemed an opportune time to come to the Youngstown-Boardman area as well. Jim, it is a pleasure to be here in your District and I look forward to hearing your remarks. This would be a good time for us to welcome us here, if you do. [Laughter.]

Mr. TRAFICANT. Well Mr. Chairman, we do welcome you. We feel very sad that the unfortunate situation in southeast Ohio—Mr. Applegate's District—has forced such a real problem on the State of Ohio and such hardship. But the fact that you made yourself available and brought the Committee out at the expense of such, and brought your key staff out to put on record those particular problems, which is tantamount to having this type of a process be made available to other members in Washington, is to be commended.

We want to thank you. But I want to thank you for being more than just the Chairman of the entire Public Works Committee now. I want to thank you when you were Subcommittee Chairman of the Surface Transportation Committee. I want to thank you for supporting two of my amendments to the Surface Transportation Act of 1985; the first one, to make minimum allocations to donor states permanent and protected from cuts under Gramm-Rudman. If it were not for your help, Mr. Chairman, that would not have been successfully passed at the Committee markup. We thank you very much.

Second of all, as we also know, we were able to expand section 128 of the Surface Transportation Act for the first time in many years. Again, with your help, we made that possible. Under that Surface Transportation Act, section 128 deals with highway safety matters. We were able to update highway safety to make guardrails, bridge barriers, signs and lights a full 100 percent funded by the Trust Fund, and under the Act. That means that many states that were hurting for funds, would just not opt for highway programs where there were matching requirements, thereby safety requirements were not met. In addition to that, bridge barriers and guardrails are a major staple of our industrial infrastructure here and we have testifying today from one of the top industrialists, in my opinion, in the nation, Mr. Charles Syak of Syro Steel and his assistant David Lewis, to discuss some of their types of problems.

So I thank you for making that legislation possible. And then as a spinoff for that, I thank you for making it possible with the passage of that legislation. The State of Ohio was so enthralled that they came in and were able to work out agreements for the 711 highway construction, the Division Street Bridge as a shoot-off of that and eventually tie in our airport with the highway system at Kings Bridge Road, both of those have been scheduled.

Regarding those two amendments, Mr. Chairman, I thank you again, you were the staple for that successful development.

Specifically last week, which you are very well aware of, we were able to have funds appropriated for the startup, feasibility studies, engineering studies and procurement and land acquisition for two major highway projects. I want to again thank you, because these projects were not authorized by the Committee, but if Glenn Anderson from California did not want and approve these projects, they would not have become law—period. He allowed the Appropriations Committee to apply $3 million to start up the Hubbard Expressway that will connect the 680 system near Hemrod Avenue with Interstate 80 up near Hubbard. That will be a tremendous shot in the arm for this valley and Chairman Anderson's active participation in the process made the funds available.

Second of all, we have been working with the riverbend people in Struthers, Campbell, Lowellville and Youngstown on a project near old Center Street Bridge. About a year ago, we moved to develop a Riverbend Project Committee and Bill Fergus, Mr. Getchey, Jim Wells and all the respective public officials came together. In order to make that land at old Barron Steel Mill property valuable again, we need access from the highway system and then we are going to have to clean it up under EPA and we are going to ask that you help at another time on that issue. But specifically, the Chairman also supported us in developing the access ramp from 680 and provided $2 million for startup of that particular project, which will take the freeway system directly to that abandoned property.

So with that background, we want to say to Glenn Anderson, Chairman, from California, a motorcycle specialist—used to race motorcycles—we want to say thanks. And when it is all over, you will come in on one of your motorcycles and wrap around one of the access ramps and maybe even buy some property down there.

But I am completing my statement, Mr. Chairman, I am going to just be brief.

Mr. Chairman, there are a number of other things affecting this valley. We lost an awful lot of jobs in the steel mills and the steel industry took a nose dive. We have been slowly but surely trying, and having some success, at diversified opportunities outside of the realm of heavy steel manufacturing and development. Today, specifically, there are several other things that are very important and I know Bill Fergus and Mr. Ryser are going to bring those to our attention as far as targets are concerned.

Number one, we want to develop a new bridge at Center Street, which that new access ramp will focus around. We want funds in part of the next bills to come out of the Congress to develop that bridge in conjunction with the State of Ohio.

Second of all, as a priority, we want to ensure the protection of the water supply for a large part of the population in this particular valley; that being, the Neander Reservoir. We will be asking for specific structural enhancements and improvements to the bridge which transports passengers and commercial traffic across our drinking water and we have had some problems with spills. These matters will be brought in the form of spécific bills to the Committee and we are looking for help in the next years—five years—Surface Transportation Bill.

In addition to that naturally, we will be looking for more funds to augment and enhance the development of the two—the Hubbard

Expressway, the access ramps program and the connectors to a new bridge down near Center Street bridge crossing the Mahoning River.

Finally, there are a couple of other things, as some people will testify about them today, I was able to attach to the Economic Development Administration Bill an amendment that did pass and was accepted on the House floor after being originally rejected at the Committee level. It provides for a fund of money that can be used only when a bank or a group of banks in an economically depressed area, makes a private loan. Funds would be provided for the interest-rate buydowns within a given economic target area facing such depression.

I appreciate the fact that you have helped me so far, but the EDA bill has not been heard at the Senate yet and we continue to operate on appropriation level. Even though it is a shoot-off of our Committee, I am asking Public Works to support my measure coming up on the housing bill for economic development thrust at that particular level.

With that, Mr. Chairman, we have several communities with problem water supplies; one is Liberty township, they face a tremendous amount of problems—we will hear about that. And second, is a little community called Washingtonville, who has had a drinking water problem down there and a supply problem that is horrendous, and I am hoping that we can do something about that.

With that in mind, I want to thank you, your Committee staff, and Sante Esposito, who really put up with me on these last two projects. He was about ready to bail out. And Paul Schlesinger and Martie Downie is here, Susan Fry, and we are very thankful that you are here, and we have a group of witnesses that will explain our problems somewhat and attempt to put on record those particular issues.

So I thank you again for being here, Chairman.

The CHAIRMAN. Well thank you, Jim. I do not know whether I should say thank you for the nice remarks about me or give you heck.

Mr. TRAFICANT. Do not say it.

The CHAIRMAN. It is kind of interesting, he singles out—I was a professional motorcycle racer, I made money at it, but he singled that out to introduce me to you. He did not tell you that I was a rather successful businessman, so much so that the people in my District elected me Mayor of my city in 1940. From there they elected me to the State Legislature, then Lieutenant Governor and now Congress. This is my 51st steady year in government, and he singles out all my background to one little time when I was much younger than any of you here today, a professional motorcycle racer. So I just want to let you know——

Mr. TRAFICANT. I thought that that was unique on your record.

The CHAIRMAN. Well it might be unique.

Mr. TRAFICANT. It shows the bravado with which you handle this Committee.

The CHAIRMAN. We will stop on that right there. It is fun to be here and at this time I think we will call our first panel forward.

We have the Honorable Robert Hagan, State Representative; the Honorable Joseph Vukovich, State Representative; the Honorable

Sean Logan, State Representative; Jeffrey Chagnot, Chairman of Development, City of Youngstown, Ohio; Ken Gran, Clerk/Administrator, Mahoning County Commissioners, Youngstown, Ohio; Ivan Hoyle, Berlin Township Trustee, Berlin Center, Ohio representing Mahoning County Trustee Association and John Wargo, Chairman of the Columbiana County Commission. I think that is all the names there.

Because we have so many witnesses testifying, it will be impossible to ask questions of each individual and I would hope that you could make your remarks relatively short and I will assure you that if you have a full written statement, it will be printed in the record as part of the testimony, in its entirety. But we do have a problem because, after you, there are some other people. And I am also not going to tell you which ones come first. You can make up your mind, you can do it in the middle or each end or alphabetically or how ever you want to do it. I called Hagan, Vukovich, Logan, Chagnot, Gran, Hoyle and Wargo in that order. Now it is up to you.

Mr. TRAFICANT. Several state representatives are not here, but Representative Logan is here and perhaps we might start with Representative Logan, Mr. Chairman.

The CHAIRMAN. Okay.

TESTIMONY OF HON. SEAN LOGAN, STATE REPRESENTATIVE, STATE OF OHIO; JEFFREY CHAGNOT, DIRECTOR OF DEVELOPMENT, CITY OF YOUNGSTOWN, OHIO; L. KENNETH GRAN, CLERK/ADMINISTRATOR, MAHONING COUNTY COMMISSIONERS, YOUNGSTOWN, OH; IVAN HOYLE, BERLIN TOWNSHIP TRUSTEE, REPRESENTING MAHONING COUNTY TRUSTEE ASSOCIATION; AND JOHN WARGO, CHAIRMAN, COLUMBIANA COUNTY COMMISSION

Mr. LOGAN. Thank you.

I am State Representative Sean D. Logan from the Third Ohio House District, which includes all of and only Columbiana County, just south of here.

I would like to take this opportunity to thank Chairman Anderson and Congressman Traficant for the opportunity to present our testimony today. And I would like to speak briefly in support of this Committee's efforts to improve the area's infrastructure, including the proposed expansion and improvement of Ohio State Route 14 and United States Route 62.

In my District, Columbiana County, as in most areas of Ohio, job creation remains our highest priority. Its importance cannot be over-emphasized. Our unemployment rate still lags behind both national and state averages, as does our rate of business startups. While we have made progress in the last decade, too many of our people are still unemployed and under-employed. Our ability to attract and hold the jobs of the future will rest, in large part on our ability to provide business with a quality infrastructure.

Without sound infrastructure; without access to sound utility service, good roads and highways, good water and modern waste disposal facilities, no strategy for business development can be fully successful. I encourage and support any action that this Committee can take toward achieving these ends.

In this part of the state, we often take for granted our proximity to the Ohio River and its tributaries. Sometimes we do not fully appreciate the value of our water resource, nor do we often enough appreciate the importance that industry places on the availability of clean, plentiful water.

Many businesses that we lost to the so-called sunbelt 15 or 20 years ago, are now looking at the midwest with new eyes. The very attributes that once put us at the center of America's industry in the heartland are once again attracting the attention of business. I want to be sure that when businesses look to the midwest, we in eastern Ohio will be ready.

Thank you.

Mr. **Chagnot**. Thank you, Mr. Chairman, Congressman Traficant and staff people present.

The City of Youngstown—I am representing Mayor Ungaro and the City of Youngstown. We have submitted a brief written statement for the Committee's review and I will keep my remarks brief here today.

I think in terms of infrastructure and transportation projects, improvements to that system, I think that a greater consideration has to be given to areas like Youngstown, whose economies have undergone such a massive transition from its traditional economic base, being the steel industry.

The steel industry, historically grew up around the transportation system of railroads and lake transportation and was not as heavily reliant on the highway transportation as is prevalent in today's economy. I think when we talk about projects such as Congressman Traficant mentioned in his opening remarks, it is important that we keep in perspective that those were projects that probably should have been built 25–30 years ago when the interstate system was developed, but perhaps not developed because of the local economy's reliance on steel and heavy manufacturing and reliance on the rail system and other transportation systems. So I think it is extremely important that the Committee take back with it the historical perspective that areas such as Youngstown and other areas of the Mahoning Valley that were previously a steel-oriented infrastructure and transportation system, that that be recognized and taken into account in the development of programs that are meant to address the infrastructure problems of not only Ohio, but of the nation.

Thank you.

Mr. **Gran**. My name is Ken Gran. I am the Clerk/Administrator for the Mahoning County Commissioners who could not be here today because they are attending a NACO convention in sunny Florida, in Miami. But they asked me to be here to represent them, and, of course, my statement is very general, and I am going to read it rather quickly. It has been submitted for the record, but I will read it very briefly as best I can.

"A Mahoning Valley for Today, Tomorrow and the Future", I am very positive in this statement and of course it is from the heart and I hope you will appreciate that, Mr. Anderson and also our Congressman Jim Traficant.

It is often said that the Mahoning Valley is located in the most strategic area of the northeastern part of Ohio and the United States. It is midway between Cleveland and Pittsburgh and midway between New York City and Chicago. It is the center of a 75-mile radius population of 7.5 million people.

Once dominated by basic steel, the Mahoning Valley continues to be a factor in that business area, but its industry has been diversified and it includes automobile assembly and parts manufacturing, metal fabrication of various kinds and plastics. Mahoning Valley is fast becoming a service and distribution center. It is served by modern highways, notably the east-west Ohio Turnpike and Interstate 80, and the north-south Route 11 that connects the Ohio River to the south and Lake Erie, which lies 50 miles to the north of our area.

The community profile of the Mahoning Valley features modern, well-equipped and staffed health-care facilities; an outstanding urban university campus; visual and performing arts and cultural activities second to none; a treasure chest of community historical values; a progressive public and private educational school environment; a convenient and easily accessible transportation network; a dedicated and highly-skilled labor force; a sincere a diversified ethnic and minority population; a park and recreation system featuring the sensational Mill Creek facility—all in all, Mahoning Valley is a great place and it needs and deserves tender loving care.

It was good news to hear the announcement that federal funds are being considered for the Hubbard Expressway connector to Interstate 80 in Hubbard and the proposed improvement and ramping interchange connector at the Center Street bridge with the City of Youngstown 680 bypass. But, the Mahoning Valley has felt a tremendous financial pinch with the loss of the federal revenue sharing money, especially in our townships, our villages and our municipalities of Mahoning County. The State of Ohio has put their best foot forward with the passage of Issue 2 monies, House Bill 704. This provides for a state-local partnership to maintain and restore the essential service needs of our communities. It is designed to generate new investment in new and existing water, sewer, wastewater, road, bridge and solid waste programs. These are essential needs for us to be absolutely concerned about inasmuch as they are of absolute necessity for our growth.

In conclusion, it has also been said that prospective industries seek out the amenities of an area and evaluate and compare them to other prospective geographical site locations being considered for relocation. We strongly feel that we must continue to strive for infrastructure preservation and investment in order for us to preserve a competitive position in the competitive market of maintaining and attracting industry to Mahoning Valley.

The Board of Mahoning County Commissioners has demonstrated their positive approach for local funding with the various levies and taxation initiatives that have been implemented. These funds are available as matching funds for federal and state funding programs that can be utilized for the Mahoning Valley. We are firmly convinced that we are a "diamond-in-the-rough" from the standpoint of geographical location, but we need some funding assistance and help to polish that diamond in order for it to glitter and attract economic and community development growth for the future of our young people in the Mahoning Valley.

Thank you.

The CHAIRMAN. Mr. Hoyle.

Mr. HOYLE. Mr. Chairman, my name is Ivan Hoyle, I am President of the Mahoning County Trustees and Clerks Association.

With the loss of federal revenue sharing, townships felt a tremendous financial pinch and infrastructure was the top loser. The State of Ohio tried to help with this problem by passing Ohio House Bill 704, commonly referred to as Issue 2. This bill provides for a state-local partnership to maintain and restore the essential service needs of our communities. The program is designed to generate new investment in existing water, sewer, wastewater, road, bridge and solid waste projects and to have that new investment available to every governmental unit which has a need for assistance.

Although we have good cooperation between the townships, county, village and city governments in Mahoning County, the needs cannot possibly be met by the state programs. Ohio has done much to help its own communities, but most certainly more funding from the federal government for infrastructure is essential.

Another top priority must be the jobs that affect our very existence; especially that of our youth. If we do not provide job opportunities for our young people, they will leave our area and take with them their knowledge and work skills. Approximately 70 percent of property tax monies go for the education of our youth. This is a huge investment and we should spend more to create employment opportunities that will keep citizens in the townships, villages and cities of Mahoning County. Infrastructure and jobs walk hand-in-hand.

We can, and must, have preservation of existing jobs and infrastructure at the same time we are expanding into new areas of both. Federal and local governments must work as a partnership to maintain and restore the services that are necessary for business to invest in the Mahoning Valley.

Thank you, Mr. Chairman.

Mr. WARGO. Mr. Chairman, Honorable James Traficant and staff.

I have but two items to bring before the Committee today. Let me say first from a historic perspective, we are, Mr. Chairman, a community that was developed around the steel industry, including my family who were both steelworkers and railroaders. Our industry really does not exist as it once did, after having seen the ravages of economic turnover and after being plucked by the hide binders on Wall Street in the mergers that have taken place, we have little to nothing to show that we were once a steel producing area.

But we are not one to die, but believe that there is enough skill and enough talent here in the valley that we can do something to help ourselves. And if there is one thing I have learned in 30 years of being involved politically—and I think it has been taught to me, or the point has been driven home by Congressman Traficant—and that is, nothing comes to you, you must make it happen. And he has proven that time and time again.

The two items are both transportation related. The two are highways, as is indicated in the exhibit, and we have an occurrence happening just across the line in Pennsylvania which really makes some of this maybe possible to envision. When $600 million is being expended on an airport just a few miles away, the approachways to the airport alone are $60 million, and we have got highways here that are four-lane highways, that end and go nowhere. And we need to link those with Pennsylvania. That has been ongoing for 30 and 40 years and we are still nowhere. We need to develop the final links on those highways. Pennsylvania is way ahead of us, and I followed the Pennsylvania governors and lieutenant governors and Ernie Klein, Lieutenant Governor, when he came over and told us we are going to build a four-lane and we are going to replace this bridge at East Liverpool. And I thought "I will never live to see it." It has already been there a dozen years and Ohio has done nothing to connect into that system.

The second item is the seaway project which was not proposed by Mike Kerwin or it was not proposed by John Wargo or Jim Traficant, but by George Washington. When he surveyed the Wheeling-Baltimore Road, his project was to next develop a seaway project to the Great Lakes. It did not happen. Even after Roosevelt signed the authorization—Franklin Roosevelt, in the mid 1930s. And the war took the funds away. Our historical study and profile shows that some of the opposition at that time, which is not formidable nor valid today, also did some lobbying. And I think you and I both know what lobbyists are and how they operate. They did an effective job and here we are today proceeding to do an update on the Army Corps feasibility study.

This spinoff would not only impact on Youngstown, but probably over the entire—there probably would not be a state in the union untouched by such a project in some fashion, primarily in cost-savings and probably in the balance of trade.

And on that, Mr. Chairman, Congressman Traficant and staff, I thank you.

The CHAIRMAN. I will probably ask you one question and then I am going to turn it over to Jim to ask you some questions.

A general question for the panel is that clearly infrastructure problems exist nationwide, but the magnitude of the needs are not really known. On the one hand, older industrial areas with aging facilities, need substantial rehabilitation or replacement. On the other hand, growth areas must expand existing infrastructures to accommodate new residences and businesses. Even though this is a problem nationally, can you give us a local perspective, some idea of what steps you expect to take or should be taken to meet your particular infrastructure needs and what kind of help you can expect from the state and from the federal government?

Mr. LOGAN. Mr. Chairman, I believe we are getting a lot of help from the state, and as much assistance from the state as we can receive at this time. As the gentlemen said about Issue 2, it is a very good program, it is one of the largest in the country, but it does not do enough. Because we have been a donor state for so many years, and because we are in part of the rust belt, and our roads, our infrastructures take a lot more of a beating due to the weather and all types of other conditions, we need the help that the—as you said, developing areas also need—but we have a chance—or we need a chance to becoming developing areas just as the sunbelt region does also. We will not get this chance unless, as Commissioner Wargo said, certain projects that ended 30 years ago, and they go nowhere, unless those projects are completed. And that is the key. We can be developing centers just like anywhere else in the country, but we need projects like Hubbard Expressway, we need projects like improvement and expansion of State Route 14 through Mahoning Valley to Columbiana County. We need these projects and it takes, as you said, it takes a combination of local, state and the U.S. Government participation. But I believe that the state government has made some serious initiatives and that the federal government, I sincerely hope, will take a serious look at these areas that are donor states and are suffering.

We have the work force, we have the ability, but we need the opportunity. And while we are not just going to sit back and wait for handouts, we are going to do something about it. That has been Issue 2, and we are going to continue to do what we can.

The CHAIRMAN. What we want is you experts in each part of the country to kind of tell us what you think should be done, because almost every place is different. Some areas are undeveloped and have great potential. Others are older ones. I happen to have an area—this is kind of a twist around, but they all have problems. I have one where the interstate that is in my area was recognized as the most highly traveled section of interstate in the nation, but that brings congestion. And here just a few weeks ago, there were seven of the big industrial businessmen who are involved in import/export and delivery called a special meeting with me and they pointed out that this little road from the ports where the stuff comes in to where they have to take it to ship it out, and so on, where it used to take them 45 minutes to drive a truck and do it, today because of congestion it is two and a half and three hours. and when you pay a truck driver $25 an hour or whatever it is, you pay him for three hours instead of 45 minutes, it raises the cost of what you are trying to sell. And they said you have got to do something about that so it can move faster.

Every place in the country has a different idea, different problem. We think—you know, often you think a congested area is going to be easy and great, but you find they have problems too. But what we want to do is get the advice of experts in each part of the country to tell us what they think should be in their area and of course it will be their representatives like in this case, Jim Traficant, to help interpret that and work it in the legislation that we have.

Of course, Jim knows that I have plenty of meetings back in Washington. We want to hear from him, but we also want to hear from you people to kind of give us some guidance all over. As a matter of fact, you mentioned Pennsylvania awhile ago, they have also asked for some hearings there too, so we are going to be holding hearings there. I think there will be three different scheduled hearings in different parts. In that State, their problems are different. The problems in Youngstown, I guess, are different than the problems in Pennsylvania. So that is what we want to get from you.

Mr. LOGAN. I think basically our problem would deal with complete projects that have not been touched for quite awhile—specifically for Columbiana County. These projects are located in Mahoning County and that—I feel that is the biggest area. It is not so much I guess congestion. Right now we would kind of like to have that congestion I guess.

The CHAIRMAN. Yes.

Mr. LOGAN. I always thought that U.S. Route 62 between

Massillon and Alliance was the most traveled. But I—personally I feel that it is the completion of projects that can definitely be of a big benefit and big help.

The CHAIRMAN. Jim, why do you not give us your message.

Mr. TRAFICANT. Thank you, Chairman.

Just briefly, first, I did not hear any specific request for specific projects to be either initiated or completed. I ask unanimous consent that such requests that they may make specifically about specific projects and infrastructure needs, in writing and in detail, be submitted to me.

Second of all, rather than belabor and go back over that, I just have a couple of questions. I will direct the questions in general just to one individual and that will be Mr. Wargo. Mr. Wargo is a former state representative, very active state representative, and had very much to do with a lot of the improvements between Erie and East Liverpool. And we appreciate that, John.

John talked about a couple of projects, as well as Sean Logan from the state. Just real briefly, State Route 14 and State 62, these are the two that you would like to see that connection made with the greater Pittsburgh Airport, completion of those projects, is that correct, John?

Mr. WARGO. That is correct, but still we have Route 30 that comes in and is even closer, possibly shorter. And it is chopped and it goes nowhere. It exists. Canton, Massillon, Minerva are planning to bring 30 across. This is new continental 30 that runs across the United States.

Mr. TRAFICANT. Not to interrupt, but let me just say this. I have most of Trumbull County, all of Mahoning County and I have two townships in Columbiana County in my District. I have invited Columbiana County in because we make a conscientious effort not to forget those two townships, and to put on record their concerns.

But in these contiguous districts, after we have been impacted upon, Mr. Chairman, there are projects that will be successful for them which will also impact upon our area.

So you want to see 30 implemented and moved, even though that is not in my District, but that is a particular action taken by Columbiana County Commissioners.

Mr. WARGO. It will come directly through part of your District, yes, West Township—30 is the link to the Pittsburgh Airport.

Mr. TRAFICANT. Okay, 30 through West Township would be the link.

Mr. LOGAN. We are attempting to make a commitment.

Mr. WARGO. And so is——

Mr. LOGAN. Excuse me, John—in East Liverpool, but we need a commitment from West Virginia and Pennsylvania to finish their Route 30. That is the key to Pittsburgh.

Mr. TRAFICANT. In that regard, not to interrupt, but maybe the Columbiana County Commissioners could send an action or decree of the Board as to how maybe our Committee, John, might be able to get West Virginia, Pennsylvania and Ohio as a compact to sign off on your request. Would that make good sense?

Mr. WARGO. Yes, if it is agreeable, that is fine.

Mr. TRAFICANT. Second of all, John brought up the waterway. As you know, Michael Kerwin had that thing to a point where John Kennedy said he was going to build it and he said Mike, wait until my second term until I get through the election. Michael Kerwin, Congressman from this area, had the great waterway to be built. It came within a whisker of passing, it was defeated after much lobbying in those days, defeated as John said.

As you know, I was able to resurrect it because it was deauthorized in 1981. In 1985, I was able to get the Committee to resurrect it in the form of a new, updated study which would connect the Beaver River north of Pittsburgh with Lake Erie. We are beginning to draw down on that money, but there needs to be more appropriation from the Water Appropriations Subcommittee of the Appropriations Committee and Chairman Bevill will need the nudging of and the movement of our Committee to try and get the balance of those funds for such a study.

But that project—that project more than anything else, in my opinion, should be incorporated into an overall strategy dealing with, among other things, the movement of commodities, also the matter of trash and garbage and non-toxics that we are running of landfills to hold. And there have been a lot of good studies on that, and the movement of those, by taking them off our highways and perhaps using different methods of reducing those problems. Some of it deals with the waterway. I have that bill in.

I am not going to ask any questions, but ask for the Committee support. Mr. Wargo has brought it up and I deliberately did not, because I knew that he was making mention of that. I want to thank all the local officials that helped us because local officials have not really been proponents of this thing. Mr. Wargo has been one at the state level and now as Columbiana Commissioner, who has and that project as a public works project, in my opinion, would be the greatest public works project in American history—it is a great project.

So I am not going to ask any questions, I just want to say this. If you have a specific project you are going to be calling me about, I want it written down with a brief explanation and submitted to me and the Committee will take that and it will be incorporated into the minutes of this particular public works meeting here.

Mr. WARGO. Congressman, may I add just a word?

Mr. TRAFICANT. Yes.

Mr. WARGO. In visiting the Tennessee-Tombigbee, Mr. Chairman, I listened to the reports and I read the news articles that scoffed at the project. I went there, I met with the director, I traveled part of the Tennessee-Tombigbee and I saw the barges loaded with logs and gravel and lumber and coal. And that is being utilized and it is growing by the week and by the month. It is probably the most valuable thing that has happened in the south in probably 200 years. And it works.

But they are supporting us, of all things. And I asked them, I said, "How did you get this done?" They said, "Well years ago, we went up to Youngstown, Ohio and got ahold of an old fellow by the name of Michael Kerwin and we brought him down and we run him all over the bayous in a boat and we fed him and wined and dined him, and we made an honorary southerner out of him, and it worked." And now they have the canal, and we have nothing. But Mike did attempt to sell this, but he could not get local people to support it as well as he could some of the people outside the area. He was way ahead of his time, way ahead of his years in many respects and in other ways, he could not get a few of the key people that he needed.

But I would like to see a Jim Traficant and a Congressman Anderson come along some day and make this a reality. I hope that happens.

Mr. **Traficant**. And just moving off this, let me just reiterate something briefly to the Chairman, without taking too much time. They built the small locks down there. They built the small locks to hold down on money and that was a shame. Had they built 1,000 foot locks down there in Tennessee, perhaps they would have had more competition on the Mississippi. But with this last drought, you see how the Tombigbee has been paying for itself. But it can never be the waterway it should be, because of those small locks.

I want to make it clear here, we want a study that would be able to take barge traffic on the Ohio River and take that barge traffic all the way and put it on Lake Erie without anybody touching it. We are not talking about 700 foot locks, we are talking about the 1,100 foot locks that could take those big rigs. That is what Mike Kerwin was talking about.

John, I think is giving good historical perspective. We need a helping hand. The amazing thing is, Chairman, I know you have not been hit very much on this. You have been spared that from me.

The **Chairman**. You mentioned it to me.

Mr. **Traficant**. Yes, but Jim Howard, before he passed away, did make a commitment to give us a hand on that and he had. And I am hoping that Chairman Anderson will.

So again closing out, that is all the questions I have. I want specifically the projects or the continuation of projects or the type of money you have available for projects, the most pressing needs you have in each area of your jurisdiction, have that available to us and that will be incorporated as an adjunct to your particular testimony here.

That is all I have, Chairman.

The **Chairman**. Well thank you very much, panel. And we will call up our second group I guess. Thank you very much, we appreciate it.

Our next panel is the Honorable Daniel Sferra, Mayor of Warren, Ohio; Chuck Miller, Sanitary Engineer of Trumbull County, Warren, Ohio and Richard Orwig, Chairman, Trumbull County Trustee Association.

You may pick your own order. The way they are listed here is Sferra, Miller and Orwig.

[Prepared statement of Mr. Logan appears on p. 689.]

[Prepared statement of Mr. Chagnot appears on p. 666.]

[Prepared statement of Mr. Hoyle appears on p. 687.]

[Prepared statement of Mr. Wargo appears on p. 747.]

TESTIMONY OF HON. DANIEL J. SFERRA, MAYOR, WARREN, OH; CHARLES MILLER, SANITARY ENGINEER OF TRUMBULL COUNTY, WARREN, OH; AND RICHARD ORWIG, CHAIRMAN, TRUMBULL COUNTY TRUSTEE ASSOCIATION

Mr. **SFERRA**. Thank you. It is pretty good you pronounced my name all right. Most people have trouble with that name. Do not tell me you are Italian?

The **CHAIRMAN**. Thank you.

Mr. **SFERRA**. Good afternoon. It is an honor to be here today to testify before this Committee as the Mayor of the City of Warren. I have been the Mayor of Warren for 11 years now. I will not belabor you with a lot of the points that you have heard already and the points that you will hear later on.

Everyone is familiar with the loss of jobs and industry that hit Warren and the valley in the 1970s and 1980s. Warren lost population for more than a decade, and with the loss of people, Warren was hit with a decreasing tax base. We have the same areas to service, plus new areas that need services with a decreased tax base. It has been very difficult to maintain the old infrastructure while trying to attract new jobs and industry, which demand new infrastructure.

I have been watching closely, as we all did, the situation with the savings and loans in the southwest. Many of our Congressmen and the White House are saying that the rest of the nation, including our area, are going to have to pay for this bailout. Taxes from our area have been going for decades to develop the southwest. It is time that the Congress paid special attention to our area, the area that has been one of the industrial backbones of this country.

We have great infrastructure needs, not only for our bridges, but our water lines, with the new EPA requirements. The City of Warren will be making large investments in the water filtration plant. This water plant not only serves Warren, but also serves part of Howland, Champion, Bazetta, Warren Townships and parts of Lordstown. Even with the user fees that the city receives, it will not be enough to make major investments which will be needed in the system, especially the water line replacements.

We have some sewers in some areas of our town that are 80, 90, and 100 years old that as we dig down in troubled areas, we hit these areas that are 100 years old.

Streets and maintenance are a year-round effort, especially around this part of the country. We have enacted a $10 license plate tax to help fund the street maintenance program. We intend to use these monies to provide for the local match to generate funds for the State Bond Issue 2 program for maintaining our street infrastructure. The State Issue 2 requires a minimum of 10 percent local share. We have another program which we will be cutting out and replacing sections of concrete streets. These all take money.

Solid waste is an area not only of local concern, but national concern. The eastern seaboard states that have run out of landfills are now shipping their garbage west and a lot of that is ending up here in Ohio. We have our own sanitation service and we have served the citizens of Warren cheaply and effectively over the years.

As Mayor of the City of Warren, I am asking you as members of Congress to look at the infrastructure needs of our community. Our community shares the same infrastructure needs as other communities in Mahoning Valley. We are not in the position we were 20, 30, or 50 years ago. I ask your support for us, as we have long supported you in the economic development of our nation. Please do not forget us.

Mr. Chairman, I think just on a personal note, one thing that I see myself and as you talk to people all around my town and all around the city and the state, is I will never forget when revenue sharing ended in our community. I think it was the same day that happened, we seen the President Reagan at the time, I think was giving the President of Philippines Aquino $400 million to take back to the Philippines to help that part of the world. We are also spending hundreds of millions of dollars funding Europe. And what galls me is when we go to bomb Libya, France tells us to stay the hell out of their airspace. We are spending a billion or two billion dollars on the stealth bomber that is going to bomb Russia after we are bombed. After I am morgued, I really do not care what the hell we do with Russia.

But we have one or two billion dollars a copy and I look at that and that is one or two billion dollars we should be spending here in the United States. We want to send money to Poland, we want to send money all over the world, but if we keep this up, who the hell is going to want to conquer us. They will have to take over our old water lines, our old bridges, our old sewer plants.

And I think that is one of the problems that I have with the policies of the United States, is we should take care of ourselves first before we ship billions of dollars overseas, before we spend billions of dollars on weapons that God knows when we will use them, if we will have to use them. At the same time that we are doing that, we are struggling within. We all have problems in our communities with the cocaine and crack problems, we all do not have enough police to handle those situations.

I think—it is easy for me to say but I think we just have to have a new direction in our country as to what is our top priority. And our top priority should be taking care of our own streets, our own bridges, our own water needs. None of us can understand why we are sending tens of million dollars to South America to handle their water needs or sewer needs or whatever, and we are left begging. It is a difficult problem. I know it is a difficult problem for you. But just as Joe Citizen, as I look at this, I am trying to figure out why we send $400 million to the Philippines and they are shooting our guys over there and telling us to get the hell out. It was up to me, I would say okay, bye, we are out of here. We will keep the money, send it over here.

That is all of my rambling.

The CHAIRMAN. That is fine.

Mr. SFERRA. I have my technical guys right here, they will come up with something.

The CHAIRMAN. Mr. Miller.

Mr. MILLER. Mr. Chairman, in my capacity as the Trumbull County Sanitary Engineer, I am acutely aware of the public works infrastructure needs of Trumbull County in the form of water and sewer improvements and the impact of these needs on jobs in our area.

The grants program for wastewater improvements as administered by the United States and Ohio EPA through 1988 enabled larger communities and more densely populated areas to construct new and upgrade existing wastewater treatment plants, interceptor and collector sewers. I find, however, that many small communities and suburban areas with pollution problems and real needs for new or upgraded wastewater systems were unable to be funded due to competition for grant dollars. These needs still exist and are growing more acute each day. The current loan program, which was intended to replace the grants does not, in my opinion, provide enough assistance to the small communities to make these wastewater improvements affordable. Lack of these improvements has essentially prevented any commercial or industrial growth in these areas, resulting in a negative impact on the creation of new jobs. It has also left Trumbull County with many areas of failed or inadequate on-site treatment systems, resulting in the pollution of ditches, streams and water wells.

Trumbull County also has many areas which are in dire need of public water supplies. In most of these areas, water improvements are considered unaffordable due to geographics and location, population density and/or high cost of purchase of water from the supplier, or need to construct new sources of water and treatment facilities. Lack of public water supplies has also negatively impacted the commercial and industrial development of these areas and the corresponding creation of new jobs.

We have seen that areas where we have been successful in securing outside dollars to assist in constructing these water and sewer facilities, a mix of commercial and diversified industrial development has occurred.

I therefore urge the members of Congress to consider as a high priority the creation of additional programs to provide financial assistance for the construction of water and wastewater facilities in areas where the need exists and where it is currently not affordable.

In my written submittal, I have included tables which I have listed and prioritized numerous projects, both water and sewer, for Trumbull County.

I thank you, sir.

The CHAIRMAN. Mr. Orwig.

Mr. ORWIG. Mr. Chairman, I represent the 24 townships in Trumbull County, Ohio and most of what I have to say is a repetition of what my colleagues here have said, and the first panel. Briefly, I will go through a few things for you.

One item, culverts and sluice pipes are deteriorating faster than we have funds available for repair.

Roads are deteriorating faster than budgets can let them be repaired.

Our budgets have lost money in re-evaluation of property in the townships.

Levies are very difficult to pass for road improvements because of the school and fire department needs.

The big item is the elimination of revenue sharing has really put a crimp in our plans to improve roads and ditches. We ask that revenue sharing be implemented back in the program as soon as possible.

Machinery and equipment repair hamper our plans for the repair of roads and culverts and ditching programs.

The continuing escalating cost of insurance is a big item that is hurting townships, especially small townships. And also the continuing escalation of material and equipment.

I would feel that our number one priority in my township of Howland would be the need for water supply. We just had a thirty some million dollar project, a sewer project, funded by the EPA and locally, in our township but we certainly need water to go along with it.

Another big item is repaving in the townships. For example, in my township, we repave a road approximately every 16 years. We have 71 miles of roads. In Warren township, every 18 years; Bazetta township, 30 years; Weathersfield township can only afford to repave roads every 34 years. That is not acceptable. The State of Ohio says that paving should be done seven to ten years. Storm sewers in most areas were not designated to handle the size and quases prohibit future development.

We can handle some of the local funding, Mr. Chairman, but we cannot handle it all. We need help from the Federal Government, as revenue sharing was, and as Issue 2 is now being done by the state, and that is helping us tremendously but we still need more help because we are way behind—we are way behind.

Thank you very much.

The CHAIRMAN. Thank you. Thank you for your statements, they have been informative. I would ask a couple of questions and then I will let Jim.

I would ask the same question of you that I asked of the previous panel. From the local perspective, what steps do you expect to take to meet your particular infrastructure needs. What kind of help do you expect from the state and the federal government?

Mr. SFERRA. Well Mr. Chairman, we have enacted license plate—additional license plate tax just for our roads. The City of Warren has sold millions of dollars worth of bonds to take care of our infrastructure. As far as help from the feds, the 11 years I have been mayor and the eight years before—19 years I have been involved in politics, probably the best program the government ever had was revenue sharing because that money came directly to us to use for our needs for what we felt was important to our communities, without any strings attached. And I think all the cities in this area handled that money well. There were some areas in the country I know that did not need the money, I just wish the Congress would have looked at our areas and areas that needed it.

But give us the money and we can handle it ourselves. Like I said, the revenue sharing was perfect for us. We were able to buy police cruisers, fire cruisers—fire trucks and this sort of thing. Whenever you are dealing with the federal government or the state, there is a lot of red tape, but I think that we have faith in ourselves that we can handle it ourselves. Like I say, once again it is easy for us to say that and like you say, just knock out four of those stealth bombers and we can put revenue sharing back on the table.

The CHAIRMAN. My second question is how important do you believe the condition of your infrastructure is to the economic growth in this area?

Mr. SFERRA. Well we have one bridge in our city that the engineering report said it was scary and it is going to cost around $5 million to replace just that bridge. That is a vital link between two sides of our town. But I think especially in the townships and in the country, the infrastructure, if Mr. Miller wants to address that as far as bringing sewer—we have a lot of undeveloped land in this area but we cannot get sewers or water lines out that far.

Mr. MILLER. If I can, perhaps by example, pick one of the projects that I submitted. I have heard earlier mention of the proposed interchange at Kings Grave Road and Interstate 11 that is scheduled. That area is prime for industrial and commercial development; however, we find that we have an existing wastewater treatment plant which the county is currently leasing from the airbase out there, and operating in an attempt to provide limited capacity for some existing commercial and industrial development. With the interchange, we definitely need a sanitary sewer improvement stretched out to that area. We are talking about a million and a half dollar improvement, that currently, the only way we can finance is by adding this cost to the monthly sewer bills of the existing users in an assessment. This does not come close to covering that cost. If we start adding these type of capital improvement costs to the existing sewer rental charges, you are starting to make the cost of sewerage treatment unaffordable, based on median incomes and percent of that income that should be charged to wastewater treatment.

So with the coming of road improvements, you also need the water and sewer improvements so that the following commercial and industrial development can proceed in a normal manner.

Mr. ORWIG. Mr. Chairman, you asked what we specifically can do in our local communities. In my township, we have passed levies, bond issues to the extent that we are probably very closing to the highest taxing district in Trumbull County. We cannot go any further, we cannot ask the people for any more money. We have a budget of between three and four million dollars and we spend—we have about 20,000 population. We spend that money, every bit of it every year and we do as much as we can with road repairs, culvert repairs. We are not permitted to put water lines in, we are a creature of the Ohio legislature and we can only do what the Ohio revised Code permits us to do. There are some new bills that have come out that will permit us to do some things. It is new and we will be getting into that, but we just run out of money all the time.

By the time you pay your employees, your police, fire, road department people and your secretaries, you are spending 70–80 percent of your funds right there and what do you have left for lights, gas, telephone, those kinds of things. We just cannot go any further.

Thank you.

The **Chairman**. Mr. Mayor, on the bridge in Warren, what happens when you go to the State Department of Transportation and seek funding for its repair out of the state's apportionment of federal bridge replacement and repair program funds?

Mr. **Sferra**. Well we are currently on the list where the state will pick up 90 percent of the funding, but still for the City of Warren, we have to come up with $500,000, either in another user fee or we have to go out and sell bonds.

The **Chairman**. So you have to pick up ten percent of that.

Mr. **Sferra**. Yes. And $500,000 to us is a lot of money. If worse comes to worse, we will just have to go on the market and sell notes and get ourselves deeper in debt.

The **Chairman**. My next question is will not the state's program fund its repair and the answer is yes, but the problem is how do you get local matching funds to match that.

Mr. **Sferra**. Right, that is—with Issue 2 every year I think the percentage goes up too. It is a problem with all of us. Ninety percent is nice, but we still have to come up with our ten percent.

The **Chairman**. The matching funds, that is something of course that we all have to do, we have to require that the local people come up with something, some type of matching.

Mr. **Sferra**. Right.

The **Chairman**. And in every place—I know in one of my areas, which—right near mine—is an area that we normally think of as fairly well off, but they needed some road work there and they were not able to come up with their matching share, so they were turned down. Finally we got permission for them to institute toll roads, one for each place, to raise money locally, to match the federal and state funds that were available for the project.

Mr. **Sferra**. That sounds like a good idea, but I imagine they would probably drop a rope over the bridge with me on the end of it. [Laughter.]

The **Chairman**. There was lots of screaming about it.

Mr. **Sferra**. And if I go, Traficant is coming with me. [Laughter.]

Mr. **Traficant**. Nothing we can do about that, Mr. Chairman.

The **Chairman**. Okay. Well why do you not ask a question.

Mr. **Traficant**. The Mayor is, without question, hanging over the bridge holding on to the end of the rope. And we do not want that.

The **Chairman**. And you are on the other end of the rope?

Mr. **Traficant**. I do not know. I do not want to be on the other end with him. [Laughter.]

The **Chairman**. I was going to ask him why you did not let go. [Laughter.]

Mr. **Traficant**. I think that again, each—I know the City of Warren has come up with an extensive list of projects. These projects probably need some clarification for me, specifically, to know which ones the states have already agreed to participate in and maybe put on the schedule, even though it is a future schedule. And then I can look at ways and means to try and help in some of the areas where they have not seen acceptable or they have not approved anything at this point.

Let me just say this real briefly. We give money to you through the state. One of the witnesses formerly, and maybe I should come back to this so that we understand that or maybe reinforce it. The federal government returns money from the taxpayers to the communities, but through the state. And the state legislature and the Governor and the state senate, they make the decisions on what projects are worthy, and they have the federal money to apply for those local needs.

One of the things that we have to do is understand that when we say the state is helping us, we are not getting any help from the feds—the money that you are getting from the state is coming from the feds. We have to make sure that our projects are placed around and on a schedule and being prioritized so that we get those funds, number one.

But number two, there is no question that America needs specific federal dollars targeted towards infrastructure improvements. Now Chairman, one of the things we had is we had a call from the local newspaper and they asked my staff, they said what is that meeting about with the Chairman from California and they said well it is about our infrastructure needs. They said well that sounds a little boring.

One of the problems you have, you see, is everyone is talking about economic development, everyone is talking about all these sexy programs, but nothing happens unless you have the highways, nothing happens unless you have the water lines, nothing happens unless you have that water system. There is no economic development without transportation networking. So what seems to be boring is what has been holding our area back a long time. We seem to have not done it, no one seems to care.

Now we are going to have to do that. We will have a bill and we want to stay away from the words "revenue sharing" because those will kill it. But it will develop monies at the federal level specifically for the—at the discretion of local communities—for infrastructure and infrastructure only. This will not be to pay personnel or to run county government, absorb the cost. But that initiative is coming forth from me and other members, including our Chairman, and that will be a target or our particular Committee, of an infrastructure fund specifically geared toward your needs, money that would come directly to you in the form of what we used to call revenue sharing. So that is being done.

I will not take any more time, but again, we want your specific projects from each individual township submitted so that someone does not say we want help, we want help, everybody asks for help but they do not tell us what those specific things, by project number.

Mr. **Orwig**. You shall have them, Mr. Traficant.

The **Chairman**. Thank you very much for your presentations. I could ask you more questions but I have also got some other panels that I know we have got to get on here this afternoon.

Our third panel is William Fergus, Mahoning County Engineer; Edward Ryser, Trumbull County Engineer; Jim Wells, Manager, Transportation Program, Eastgate Development and Transportation Agency, the EDATA. The order was Fergus, Ryser and Wells. You can change it, but that is also pretty good.

And incidentally too, I would like to have you make your presentations relatively brief if you can, two or three minutes, and your entire prepared remarks will be made a matter of the record. So do not worry about it not getting in.

[Prepared statement of Mr. Sferra appears on p. 737.]

[Prepared statement of Mr. Miller appears on p. 690.]

[Prepared statement of Mr. Orwig appears on p. 717.]

TESTIMONY OF WILLIAM P. FERGUS, MAHONING COUNTY ENGINEER; EDWARD E. RYSER, TRUMBULL COUNTY ENGINEER; AND JAMES T. WELLS, MANAGER, TRANSPORTATION PROGRAM, EASTGATE DEVELOPMENT AND TRANSPORTATION AGENCY [EDATA]

Mr. FERGUS. Thank you very much, Chairman Anderson, Honorable Congressman Jim Traficant, thank you for the opportunity to speak and testify before this Committee today.

In order to address Mahoning County's needs regarding infrastructure management, a study was conducted. When the cost factor portion of this study was completed, it was difficult for our local officials to comprehend the amount of money needed to maintain the existing level of service, let alone finance any new or expanded projects. Furthermore, the magnitude of these costs is inconceivable to the general public.

As part of the study, the existing Mahoning County infrastructure has been prioritized according to the needs based upon separate pavement and bridge management systems. These managements systems are documented, and they refer to attachments in the summary I have given you, one and two, to summarize the bridge and roads under the jurisdiction of the Mahoning County Engineer.

The pavement management section details condition ratings for maintenance activity that is needed for each section of the county highway system and explains the necessary repairs and costs at today's dollar amounts. The total dollar amount for maintenance action for these roadways to make them acceptable and adequate is in excess of $185 million—again, for county maintained roadways alone.

To address Mahoning County bridges, a similar management system assigned a figure of an additional $70 million that is needed over the next ten years to get all 323 bridges maintained by the county up to an acceptable level. These projects include replacement, rehabilitation and general maintenance to all existing structures so that annual maintenance costs after the year 2000 can be maintained at a level that is suitable enough to support the ongoing cycle of maintenance.

To sustain the infrastructure, an efficient drainage system is needed. The present drainage system is inadequate, eroding and particularly deteriorating. In order to keep pace with growth and economic development, the widening of existing roads will be necessary, new and upgraded drainage systems will be coordinated with the pavement and bridge maintenance programs. This is a necessity because the condition of the drainage facilities is a contributing factor to the deterioration of the overall infrastructure system itself.

Present and future traffic safety needs are another issue and another fact. The increase in the volume of traffic not only abuses the roads that are not built to handle those amounts, but also creates unsafe conditions for the motorists.

The Mahoning County infrastructure system presently relies on its portion of state gasoline tax and license plate fees for revenue to maintain the system. Even with a recent increase in the license plate tax or fee, we will have to sell bonds in an attempt to match state and federal revenues to accomplish major construction for infrastructure projects.

I am confident that you can realize the vicious cycle that surfaces with retiring bonds with the hope that even if we can support our share of those much needed infrastructure projects, that federal revenue funding is readily available. For that funding to be readily available, I say this, that the federal Highway Trust Fund should stand alone and be released from the general federal budget. Secondly, that the federal highway funding, in particularly those areas where we in local government rely most heavily, must be reappropriated at levels which will at least give us the same level of participation. Third, it should be used only for one purpose—to improve the nation's transportation infrastructure.

Once again, I am confident that you can understand the severity of our situation and the need for your additional assistance regarding the Mahoning County infrastructure system.

And just a few other comments, I would like to say this, that the minimum allocation presently is set at 85 percent. The Congressman was very active in the last reiteration of the act to raise that so that the State of Ohio now has available to us minimum allocation funds under the Urban Highway System. The urban system is a system that we at the local level utilize the most as our bread and butter issues. That I believe is authorized at $500 million a year. That should be increased. There are a lot of areas that do not utilize those funds—we do.

Also, the participation in the federal system, federal highway system programs, based on individual projects, depending upon what percentage of federal aid funds there are, should not be reduced. We depend on them very heavily. We are developing programs in Mahoning County, most recently with the installation of an additional highway license plate fee increase, we are going to finance hopefully about $52–$53 million worth of projects, $40 million of that is federal aid money. Those monies are either urban highway funds, secondary funds, bridge funds and so forth. Those particular funds are being counted on now, they are very significant, we are going to need those when we go to the bank to sell the projects. Please consider that when you are reauthorizing the bill.

The Center Street project, very specifically as the Congressman indicated, is a very high ticket item. It includes at least three different sources of federal funding at the present time. We hope that we can depend upon that by the year 1996 when we hope to get the construction, or before 1996.

Thank you very much.

The CHAIRMAN. Thank you. Mr. Edward Ryser.

Mr. RYSER. Yes, sir. I would like to thank the Committee for the opportunity to be here today.

The office of Trumbull County Engineer has a severe funding problem.

Our office maintains 464 miles of road within Trumbull County and 515 bridges. The Ohio Department of Transportation has established an average life for bridges at 50 years. The average age of our structures in Trumbull County is 39 years of age. We are very rapidly running out of time. One fifth, or 20 percent of our structures are currently posted with a load limit of less than allowed legal load limit for vehicles. About one half of our bridges are structurally deficient either by load limit, narrowness, insufficient waterway, deterioration and so on.

Our 464 miles of county road are also in critical condition. The Ohio Department of Transportation recommends that asphalt roads be resurfaced on a ten year cycle. Past history tells us that our roads are being resurfaced on a 16 year cycle. This situation causes extremely rough roads, chuck holes, bad drainage, narrow and under-capacity roads making for an unsafe road system. Similarly, these impacts on signing, guard rail, signal systems, culverts, roadside drainage and pavement markings.

The above situation exists even though we have utilized an average of over $1.2 million of federal funding on our county road system per year.

I have enclosed a highway system needs booklet which was developed by our office when we attempted to secure additional automobile registration fees.

Hopefully your Committee could recognize local government's need for additional funding.

I would like to tell you that I think local government is being bypassed in one way or another by both state and federal governments in the area of funding. We are—especially here in Ohio, we are being tossed back to what they call permissive taxes to secure our funding. In some areas the permissive tax works. In other areas it does not because the official who has the responsibility for the road system may not have the support or the authority to put the tax on, so therefore, creating a very unusual crunch in my area where three Commissioners saw fit to put it on the ballot but not to adopt it themselves.

Other than that, I thank you, gentlemen.

The CHAIRMAN. Thank you.

Mr. Wells.

Mr. WELLS. I am Jim Wells from EDATA, the metropolitan planning organization, MPO, from Mahoning and Trumbull Counties.

Since our presentations will be read in, I will just keep this short and very informal.

I hope that Mr. Getchey's statement will also be read into the record.

Mr. TRAFICANT. I ask that Mr. Getchey, the Director of EDATA, statement be incorporated into the record as well, Chairman, along with Mr. Wells.

Mr. WELLS. He is out of town today and could not be present.

The CHAIRMAN. Mr. Getchey's statement will be incorporated into the record.

Mr. WELLS. Very good, thank you.

You have heard from Warren, you have heard from Trumbull Sanitary Engineer on the need for water and sewer lines. Trumbull County has presented an extensive list of projects. I believe Warren also has an extensive list of projects.

You have also heard of the state Issue 2 program, or the infrastructure improvement program. EDATA is the—administers this program for the two county area.

The needs that have been identified, infrastructure needs—wastewater treatment plants, sanitary sewers, roads and bridges, totals over $275 million. The state is providing $10 per person to each of the 19 districts in the state. That breaks down—with $10 per person we have needs identified by the local communities of $275 million, that breaks down to $522 per person of needs. The local communities are paying 10 percent, the state 90 percent for those infrastructure improvements.

We have—the disposable income of the population is also decreasing and they are paying for additional things, such as Mayor Sferra identified, the license plate tax that was implemented in the City of Warren. Mahoning County is also implementing a license plate tax and this is going on throughout the entire area.

But getting back to water, they have the same funding constraints. All water improvements are paid for by the users of the system. So for maintenance and repair, the users are paying for the system. For any expansion, it is the users that are paying for the system. I believe the Chairman asked at the beginning who does pay, and that is the answer, it is the local people that are paying for expansion of the systems.

We need additional appurtenances for the expansion of new systems. It is important to economic growth and development of this area. And it is not only in the undeveloped areas of the county. It is also within the old industrial areas of the county where water and sewer lines are needed.

The Congressman has developed a planning committee to develop land along the Mahoning River, the old mill properties. If anything should come about there for industrial development, they are going to need sewer and water lines in those areas. We are looking at an enterprise zone in that area, so that is another reason to look at some other program. I like the idea of an infrastructure program, maybe a categorical program for water, sewer, highway—well we have a highway program—water and sewer program, specifically water within Mahoning County and Trumbull County.

I have listed in my presentation the projected loss of population within the two county areas as prepared by the Ohio Department of Development. They show a loss of almost 100,000 people by the year 2010. Without the new infrastructure or without replacing infrastructure, this may become a reality—I hope not.

That is it.

The CHAIRMAN. I want to thank you gentlemen for your presentation. They are very helpful and we thank you for them.

My question is, given your engineering and transportation expertise, can you tell us what new technologies now exist or might be in the works that will help ease some of the problems we have with our public facilities? For example, are there techniques that would improve the capabilities of new or repair construction, perhaps reducing construction costs or lengthening the life of highways or bridges or airport runways, or even waterway systems for waste removal? Are there some of those kinds of things that we should know about?

Mr. FERGUS. From the standpoint of materials, there is a continuing evolvement in the marketplace for new or modified materials. This area of the country is very prone to freeze/thaw, cold/hot cycles. It is very disruptive to the pavements, the bridges and everything else that we have to try and move people with. The problem is that standards are such that they are slow in reacting to some of these new materials and new techniques.

Sometimes we feel like we are stepping back instead of forward. We are running now into situations where we are dealing with hazardous materials disposal and audits in some of our projects. They are slowing them down almost to a standstill. It is almost like reinventing the wheel.

From the standpoint of utility for most of our projects, by and large we agree that if 50 years ago a bridge was constructed over a particular ravine or particular facility and we can do away with it today, we are doing away with it. We are putting in fill material and putting a solid roadway over the top of it.

We are keeping up with technology as much as we can, but by the same token, sometimes technology does get ahead of us in this particular area. It is tough in this climate to introduce new materials.

Mr. RYSER. If I could just comment—I recently, with my wife and at my own expense, spent 17 days in six foreign countries in western Europe. I had heard this many, many times myself, as I am sure you gentlemen, being over there, have seen what I witnessed. Being from Ohio and chuck holes and cracks and pavement failures and one thing and another, I could not believe it. In those six countries, I traveled 3,000 miles by bus in that 17 days and that bus hit one chuck hole. They could not get out of Boardman and get to Hubbard without hitting 500. [Laughter.]

I guess what I am saying is that as an engineer, I feel like I have been defeated. I feel as though we do not know the first thing about building highways. With the exception that I did take note that western Europe does not seem to have our clay situation, or nice, soggy clay situation. They do have our freeze/thaw, but there is not the pavement swelling in the freeze/thaw cycle and the busting up. How we get around that as engineers—I do not think there is any way possible within a financial means. Sometimes we would be better off, I think, if we—I do not know how to say this, but go very slowly on our technical adjustments—sometimes, such as full depth asphalt we now know will not work in our area, but we have spent 15 to 20 years losing the ball on salt springs and some of the others where we are having trouble. But full depth asphalt will not work on a clay surface.

There are some others. Of course, if you go overseas, they use granite and nothing but limestone, and our slag we use with our bases here today, and Congressman Anderson does not even know what I am talking about, but mill waste that we use here for a road base, they would not even use it in a fill. And we are using it to build roads on, simply because we as engineers have been forced to design, because of price and not because of quality.

There is another thing that I think sometimes we have left the old style designs, the cold mixes, the seal coats, the slurry seals and some of that, we have failed to keep up with that simply because it is maintenance and we do not have money for maintenance—that type of money or that type of maintenance.

The CHAIRMAN. When you mentioned western Europe, west Germany was probably part of that.

Mr. RYSER. That is right.

The CHAIRMAN. That is one of the countries that is about the size of one of our states, but they spent, last year, twice as much as the entire United States on infrastructure. So when you get a little country that is about the size of one of our states spending twice as much as all of our 50 states put together, you get an idea of why they are able to out-bid us in some of our competition.

Mr. RYSER. Their roads are beautiful. They put in a—we build roads and we do not back them up. By that I mean by the edge, we do not back them up, unless we are going to have a regular curve. They will bury a curve to make sure that the base cannot spill out and push out beyond the thing. We could not even think of that financially. They are doing things over there that is unbelievable too—as an engineer and with a budget, I cannot comprehend it.

The CHAIRMAN. Mr. Traficant.

Mr. TRAFICANT. Just two things real brief. West Germany is the size of Michigan or the State of Washington, and the Chairman I think said it all there, they are investing their money.

Jim, I want you to submit specifically water projects. I know you have worked very hard on that and there are some specific needs, specific projects. I want you to identify them in writing by number.

Mr. WELLS. We will do that.

Mr. TRAFICANT. Second of all, I just have one question and statement for both of the engineers here from the respective counties, you are doing a real good job. You talked about the urban highway system and that particular fund that you particularly expend. I would like for you to submit specific needs under such a system and support your position and rationale for such expansion, and I will attempt to offer a legislative amendment to that fund for increases, if the Committee then could see those specific needs and you could specify in that regard—both of you fellows maybe. And I would make your recommendations in writing placed upon the record.

The CHAIRMAN. Thank you very much for your presentation. It is very, very helpful to us.

And now we will hear from our fourth panel. We have three more panels. Our fourth panel is Jim Abicht, Executive Director of the Warren/Trumbull Community Service Agency in Warren, Ohio; Van Nelson, Youth Director, Warren/Trumbull Community Service Agency, Warren, Ohio; Warren Harrell, President, Northeast Homeowners Association of Youngstown, and Mary Ann O'Neil, HOPE Coordinator, Catholic Service League, Youngstown, Ohio.

I read them Abicht, Nelson, Harrell, O'Neil, but that does not have to be the order. Take it any way you wish.

[Prepared statement of Mr. Fergus appears on p. 673.]

[Prepared statement of Mr. Ryser appears on p. 718.]

[Prepared statement of Mr. Wells appears on p. 755.]

[Prepared statement of Mr. Getchey appears on p. 678.]

TESTIMONY OF JAMES W. ABICHT, EXECUTIVE DIRECTOR, WARREN/TRUMBULL COMMUNITY SERVICE AGENCY, WARREN, OH; VAN NELSON, YOUTH DIRECTOR, WARREN/TRUMBULL COMMUNITY SERVICE AGENCY, WARREN, OH; WARREN HARRELL, PRESIDENT, NORTHEAST HOMEOWNERS ASSOCIATION OF YOUNGSTOWN; AND MARY ANN O'NEIL, HOPE COORDINATOR, CATHOLIC SERVICE LEAGUE, YOUNGSTOWN, OH

Mr. ABICHT. My name is James Abicht, I am the Executive——

The CHAIRMAN. I pronounced it wrong, did I not?

Mr. ABICHT. You were close. I am the Executive Director of the Warren/Trumbull Community Service Agency, which is the local community action agency for Trumbull County, Ohio, or as some other people call it, the "Anti-Poverty Agency". And I guess I am here to speak very briefly about the needs of the low income in Warren and in Trumbull County.

Whether it relates to infrastructure, I hope so. It certainly relates to the issue of transportation.

I come from a city which is the largest city in Ohio, largest county in Ohio that does not have any type of public transportation. In my written testimony, you will see the horrible statistics about the high rate of unemployment, like 25 percent in one section of the City of Warren, and also the lack of job opportunities in our community.

Now consequently, there have been some solutions put up. A tax levy for I believe it was two mills for the local share for public transportation, which would cover approximately 25 percent of the cost. People have been taxed and taxed and taxed to replace the federal and state funds that have been cut off and also, like I said, because of high unemployment, they do not have any more money to spare. So they have voted down repeatedly these tax levies.

What my agency has done, we have put together sort of a patchwork system that we do provide transportation for approximately 400 people in the community; however, according to our studies there is a need to provide transportation for at least 8,000 in the City of Warren, people who have no other way to get to jobs, job interviews or for that matter any type of social services.

I would hope, even though the Congressman has not asked the question yet, a possible solution might be that for high impact areas such as Warren, Ohio, that instead of the required 25 percent match, that perhaps for the first year or first two years, that could either be lessened to ten percent or five percent, or perhaps zero percent, so the system could be started up to show the public that it would be a great asset to the community and then perhaps it would be easier to pass a tax levy to provide public transportation.

Thank you.

Mr. NELSON. Thanks, Mr. Abicht, my boss, my friend.

The CHAIRMAN. Incidentally, I appreciate you making it shorter than what was presented here. We hope you can keep it fairly brief, but your entire written statement will be in the record.

Mr. ABICHT. Thank you.

Mr. NELSON. I would like to thank Congressman Traficant and the Committee for allowing us to testify today. As Mr. Abicht stated earlier, there are barriers to overcoming poverty like the absence of public transit access within the County of Trumbull and in the City of Warren.

In addition to transportation, one of the most pressing problems within the county and especially in the City of Warren is the lack of sufficient, adequate and affordable housing for many residents, a problem which is magnified for so many of the city's low-income residents. Because so much of what I have written here has been stated already by county and city officials, I am going to hit and miss around here, and if you have had a chance to look at my testimony, you will see that it would totally change the color of this conference today, and I do not want to do that.

According to the 1980 census, there are roughly about 84,000 housing units within Trumbull County with 22,354 in the City of Warren. Based on current housing data from the local MHA, there are 21 public housing projects within the county and assistance is provided to approximately 2,700 families, about 9,000 people. Yet again, based on this census data, over 12,000 families who are 35,000 people, are eligible for subsidized housing county-wide with nearly 5,000 people residing in Warren alone.

Accordingly, less than 20 percent of those persons who are eligible for subsidized housing actually receive it, leaving roughly 9,000 low-income families unable to receive any type of housing assistance. Unfortunately, many of these persons reside in the City of Warren and an unusually high proportion tend to be black and residing in the southwest and southeast sections of Warren, called the Sixth Ward. Not just the Sixth Ward, there are many Sixth Wards all over Trumbull County, all over Ohio, all over the nation.

Given the alarmingly high level of families who are eligible but do not received subsidized housing within the county, it is not surprising that many of these families are confronted by other barriers which effectively prohibit their own self-sufficiency.

Over the past two years, another potentially more serious problem has arisen in the Sixth Ward, or if I describe it you will know there is a neighborhood like this in every city that we all reside in—the franchising of youth gangs, drugs in many of these public housing units. The gang problem has been well documented in many larger metropolitan areas, but I am here to tell you now that the organized gangs, if you do not know, they are here in Youngstown and Warren and all these little towns here. And they tend to promote vacancy rates that have been estimated to approach 40 to 50 percent. Our people are afraid to live there any more because of the presence of these gangs.

I would like to take a moment to discuss a particular area of the City of Warren—again, the Sixth Ward. A copy of the Sixth Ward analysis developed by WTCSA is included with this testimony but I will just highlight it.

It consists of three basic census tracts, population of 6,000, over 80 percent residing there are black. Four major housing projects in the ward out of 21 in the entire county. Nearly 60 percent of all these residents are below poverty, nearly 40 percent of these households are headed by female and the unemployment rate within the ward is at least double the city's rate. All of the so-called barriers or problems that we have discussed here today are clearly evident and in fact magnified in the Sixth Ward or neighborhoods like the Sixth Ward. In one major project in the Ward which has 200 units, nearly half of them are vacant and boarded up due at least in part to the presence of organized gangs and a rampant drug problem, but that is a whole other conference. The ward has the lowest per capita income in the city, the highest unemployment rate and the highest poverty rate. Nearly 50 percent of all single-family dwellings in the ward are rentals. The median value of this ward's housing stock is less than 60 percent of the city's average and nearly one-fourth of all the vacant and/or dilapidated dwellings in Warren happen to be in the Sixth Ward or neighborhoods like the Sixth Ward.

Yet, despite the harshness of this data, the ward also has the highest per capita educational level of any area in the city, and the number of individuals who attended or graduated from college is double the city-wide average. We all know that poverty is an insidious disease that does not discriminate on the basis of race, religion, sex, handicap or education level, but once that disease is manifest, it is not easily eradicated.

The lack of subsidized housing, a deteriorating housing stock and the lack of serious homeownership investment in areas like the Sixth Ward has created an untenable and unmanageable situation. The entrance of franchised gangs and the high incidence of drug use and sales has compounded these problems.

The poverty in the Sixth Ward and in fact throughout the City of Warren and Trumbull County is very, very real. The paradox of poverty, gentlemen, ladies, is that poverty even exists in this, despite what everybody says and what I hear on the news, the most powerful and the richest nation on earth. The paradox is even more difficult to understand because we know that the tools and the strategies to eradicate it are present in our society. These solutions, I admit, are neither easy nor inexpensive, but in our opinion infrastructural improvements that have been mentioned by our county officials and city officials need to be implemented, as they may help to remove barriers—like transportation, employment, education and housing. That has to be our first step.

And I thank you for your time.

The **Chairman**. Thank you.

Ms. **O'Neil**. They asked me to go next. I am Mary Ann O'Neil and I am from Catholic Service League.

I almost feel like saying "ditto" to my fellow panelists as far as Mahoning County goes. But let us just listen to a few of the things that I have learned.

Our agency has seen an increase in people whose main focus has been their housing problem, especially people who are under-employed. We have two people working in a fast food restaurant, you add two children or three or four, no medical insurance, a car that is dilapidated and needs repairs and you have difficulty just surviving, let alone providing adequate housing for your family.

Twenty agencies in our surrounding area did a survey and we found that a third of those who were having problems were doubling up. Now a lot of you—and myself at one time also—saw the homeless population as those who lived in shelters or under our bridges or down around the town. But many of these are people who are doubling up with other families. Just think about it yourself, maybe all of you have had some relatives or friends come to visit on vacation for a week, and sort of toward the end of the week you were rather praying or hoping that the week would be over and they and their children could go home. But how would you like someone to move in with you and really not know when they were ever going home.

When you think about this, it is very serious. Almost 50 percent of the children in the surveyed group were—or 50 percent of the population were children ten years of age and under.

We need more subsidized housing and better monitoring of this housing. The government paid for it, they should monitor it more closely to make sure that it stays in good condition, that the families are adequately housed.

The government is already spending billions on this problem in its efforts. Let us go one step further, let us double the numbers of subsidized housing and monitor all of their care. If we do not, we are going to pay anyway in social services and the judicial system. The housing problem is the impetus which gives all other social programs a start. It is like an incubator just allowing them to fester and grow. The statistics are staggering, the money necessary is astronomical, I know that. But remember, no matter what numbers you believe are correct, these are people and as long as our citizens—our citizens in the United States are without adequate housing, our job is never going to be complete.

Now our agency does have a program that we hope—no pun intended—which stands for Home Ownership Protective Effort. These families who are living in government-insured, FHA homes, and there are also some banks in our area participating, if they are two or three months behind in their mortgage, we can try to help them by budget counseling, by working with the banks, by exploring other alternatives for money and providing social services from our agency. However, again, the hardest hit are the under-employed and the welfare recipients who really do not have enough money in their hands to make a house payment or to do what is needed to provide extra care and adequate housing for their families.

And I thank you all for listening too.

The CHAIRMAN. Thank you. And Mr. Harrell.

Mr. HARRELL. Mr. Chairman, Honorable Congressman Traficant and Committee members, I am Warren Harrell, President of the Northeast Homeowners Association, which is an organization comprised of homeowners, who own real property on the east side of

Youngstown, Ohio. The organization was formed to protect the mutual interests and the basic property rights of the homeowners on the east side of Youngstown.

The east side of Youngstown, Ohio is a predominantly black neighborhood highly impacted with public housing.

The Youngstown Metropolitan Housing Authority, contrary to the intent of the U.S. Housing and Community Development Act of 1980, violated the act to avoid building the units in other parts of Youngstown, Ohio, which are not racially impacted.

YMHA has built public housing on Woodside and Sunshine Avenue, which will serve to further concentrate predominantly black public housing in one area of the City of Youngstown, contrary to the intent of the Housing and Community Development Act, Equal Protection Act of the United States Constitution and the Public Housing Site and Neighborhood Standards Act.

In November and again in December, 1989, we appeared in the United States District Court, Northern District of Ohio, Eastern Division, Judge David D. Dowd, Jr., presided at a hearing which we were seeking permanent injunction against YMHA to prevent them from building on their designated sites. Judge Dowd ruled that YMHA could build the units, based on the Youngstown Housing Assistance Plan, and the Northeast Homeowners Association also had a right to pursue further court action as an organization.

It is our opinion that the HUD low income housing program must be more clearly defined, so that the Regional Administrators, Directors and local officials will be more responsive and sensitive to the needs of the residents of the community.

We further believe that the site selection process in its present form and as implemented by YMHA needs intensive monitoring by a federal auditing agency for compliance of their housing program.

In closing, let me emphasize that we are for low cost housing because there is a dire need, but they must be equally distributed throughout the metropolitan area.

We have documentation which was presented to the court to support our opposition to YMHA and their housing program, which has been unfair to the citizens of this community.

I want to thank you, Mr. Chairman, for the opportunity to present our viewpoint and well known facts to this Committee.

The CHAIRMAN. Well I want to thank you all for your enlightening comments.

Mr. Abicht, you testified that there is no public transportation. Has there been any attempt to attract private sector providers to come in and fill that void?

Mr. ABICHT. There has not been any public transportation since 1974. There have been two attempts, early 1980s and mid-1980s to extend the Youngstown/Mahoning transportation system into Trumbull County. As far as attempting to attract private contractors, I would imagine that my agency is probably the closest thing to that in that we are a private non-profit agency and we are operating, like I said, a patchwork system.

The CHAIRMAN. Mr. Traficant.

Mr. TRAFICANT. I would like to respond to that. I think the City voted down an effort of the WRTA to come up there on a regional basis. I think that a regional approach to that—I do not think that everybody, with the hardships that exist, is going to be able to provide their own. I think a regional measure is the only measure, and that has to be accomplished some way.

I have, Mr. Chairman, one particular point here I wanted to make. You talk about a match problem, Mr. Abicht and maybe waiving that 25 percent, 15 percent, 10 percent. I would like for you to put your ideas down in writing in short form and send them to me.

Mr. Chairman, this particular committee was asked to attend not because of their infrastructure input, but to place on the record of this particular hearing the fact that the hardship they represent. They have discussed housing, they have discussed poverty, they have discussed youth. The area here, both Mahoning and Trumbull Counties, would be a microcosm of the nation in those particular regards—tremendous unemployment, no opportunity for young people to get work. Housing is fragmented, some of the policies of housing probably should even be investigated. So even though it is not particularly an infrastructure concern specifically, I wanted the Northeast Homeowners Association problem placed on the record with Mr. Harrell and I wanted the respective information brought from each particular group that we selected to offer this testimony, to augment the need for jobs, commitment to infrastructure opportunities for industrial and economic expansion, as how those side effects will impact upon those areas.

So I do not have any specific questions for this group except I would like your—Mr. Harrell, about the auditing procedures, the monitoring, I jotted down a note there. I would like for you to send me your ideas on how the housing program must be more clearly defined, what you mean specifically by that, put it in writing for you and your organization. Second of all, about the auditing, even though this is a different situation and does not deal with this Committee here, the auditing and monitoring and some of the ideas you have there from a local perspective, and we will bring somebody in from HUD with your organization, since you have developed that, and we will tie it in with Catholic Services League.

So they are not here for more or less infrastructure, but I wanted their information on the record to document the hardship and how this infrastructure improvement would help to improve some economic climate that would impact on these areas, to show you the need of infrastructure.

The CHAIRMAN. Thank you, Jim.

Mr. HARRELL. Mr. Chairman, may I make one other comment? I want to thank our Congressman Traficant for setting up this type of hearing. This is the first, to my knowledge, that we have had an opportunity to present our views from this area and the City of Youngstown, and I want to say to Congressman Traficant we really appreciate it and keep up the good work.

The CHAIRMAN. I want to thank you for your enlightened comments.

I have one little thought I might just throw out. Although many of the issues and the problems that you have mentioned and that you deal with are not directly under the jurisdiction of the Committee on Public Works and Transportation, they are of course of concern to all of us. Still it seems clear to me that improved public facilities enhance the well-being of people generally and provide the foundation for economic growth and development, which in turn affects the work that each of you are doing.

Do you agree with me on that?

Mr. **Harrell**. Yes, definitely.

The **Chairman**. I realize that people who are without work or without jobs or have housing problems, when you get infrastructure there that brings activity to the area, you do provide jobs, you do provide some things that help the whole general situation.

Mr. **Harrell**. That is the sole core in my opinion, that is the sole core of the family structure, to begin there. Without that, we have a fragmented community and we have numerous problems that these social agencies will not be able to handle without financing.

The **Chairman**. Do you have anything else you want to mention?

Mr. **Traficant**. The other thing that I think is very important for the social service community and the providers of services and those people that work with those in the area that are impacting upon the hardship, that we look at larger types of problems or remedies. And I think transportation is certainly one that will affect everybody and I think that we have to look towards a regional mass transportation program and if we have to, we are going to have to sell it some way. That might be worthy enough to get everybody together on that issue, I think that would be very important, and we would look at match as well.

I have no further questions, Mr. Chairman.

The **Chairman**. Thank you all for your very good presentations.

We will get ready for our fifth panel. Our fifth panel includes Bernie Gunter, Director of the Social Security Office, Mahoning County, Youngstown, Ohio; John Emanuel, Director, Social Security Office, Warren, Ohio and Martha Murphy, Director of the Ohio Department of Aging, District 11, Youngstown, Ohio.

You can take that order of Gunter, Emanuel, Murphy or you can change it any way you wish. The floor is yours.

[Prepared statement of Mr. Abicht appears on p. 635.]

[Prepared statement of Mr. Harrell appears on p. 685.]

[Prepared statement of Ms. O'Neil appears on p. 696.]

TESTIMONY OF BERNIE GUNTER, DIRECTOR, SOCIAL SECURITY OFFICE, MAHONING COUNTY, YOUNGSTOWN, OH; JOHN EMANUEL, DIRECTOR, SOCIAL SECURITY OFFICE, WARREN, OH; AND MARTHA MURPHY, DIRECTOR, OHIO DEPARTMENT OF AGING, DISTRICT 11, YOUNGSTOWN, OH

Mr. **Gunter**. Thank you, Mr. Chairman. It is good to see Congressman Traficant with us today also.

My name is Bernie Gunter. I am District Manager, Social Security Administration in Youngstown. My district encompasses Mahoning County.

Naturally, you wonder what I am doing here talking about infrastructure. Really that is not my purpose. I thought rather you needed information about how the situation is in Mahoning County. You have heard many people say we need this, we need that. I can tell you some information which supports the comments that you have heard.

First of all, Mahoning County has a high rate of beneficiaries receiving social security. As of the 1980 census, there were approximately 289,000 residents in Mahoning County. There have been some losses since that time, but as of today—or as of December, 1988, we have roughly 40,000 retired workers and wives receiving social security. We have approximately 4,000 workers receiving disability social security.

If you take a look at this on a more simple basis, we can say that in Mahoning County, there is one social security beneficiary for each 4.9 residents in the area. That is more than one out of five people as you walk down the street. This compares to a national average of one beneficiary for each 6.5 residents. The point is that we are extremely heavy with beneficiaries, beneficiaries are not known as having high levels of income—although some do.

In turn, our beneficiaries over age 65, Mahoning County has one beneficiary for each 6.8 residents in the county. This compares to one beneficiary for each 8.8 on a national basis. Again you can see the trend, we are extremely high in the number of beneficiaries.

For disabled people, in Mahoning County, we have one beneficiary for each 71.9 residents, compared to a national average of one beneficiary for each 86.8 residents. In all three of our major categories, we are running a substantially higher number of beneficiaries who, for the most part, are low-income.

I took the liberty to do a little more research today and to give you an extremely brief picture. Considering that in 1980 we had 289,000 residents. If we add up the number of beneficiaries receiving retirement, survivors and disability social security, those receiving supplemental security income form social security—this program is designed for the extremely low-income—and if you add to that the number of people receiving aid for dependent children, aid for dependent children of the unemployed and general relief, the grand total will come to 97,955 people in Mahoning County receiving a government payment. I think this points to the reasons we hear with most of the presenters today saying we need funds from some source.

With that, I will close.

Mr. EMANUEL. Chairman Congressman Anderson, Congressman Traficant, thank you for having us here today. My name is John Emanuel, District Manager, Social Security Administration in Warren, Ohio. My service area consists of Trumbull County and Portage County; however, today I am going to devote my remarks to Trumbull County.

As my colleague, Bernie Gunter, has mentioned, I think that statistics sometimes are boring, but I also think that they very clearly often present a case and I think that the situation that we want to present here today is that both Mahoning and Trumbull County have an abnormally high number of retirees and disabled individuals, who have infrastructure needs.

These folks who are receiving social security, who are retired, who are over 65, who are disabled, have the need for roads, have the need for good water supplies, have the need for good sewer systems. They have all the needs that all the other of our citizens do but they are even perhaps more vulnerable, so they have greater needs in many of those areas.

In Trumbull County, there are over 40,000 people receiving social security benefits. If you stop to think that the county has about 240,000 people, that is one out of every six individuals. One out of every six is receiving a social security benefit.

There are 2,250 people getting SSI benefits and that is a benefit for extremely low level income individuals. When we relate that to the national population—and Mr. Gunter mentioned some of these figures and I wand to reinforce those—Trumbull County has a rapidly growing aged population, very rapidly growing aged population. Of the four surrounding counties, it is the fastest growing in terms of numbers of elderly. But in Trumbull County, one out of every 5.9—and I hate to get into decimals but when you are talking about large numbers, it is significant—one out of every 5.9 people gets a social security check; nationally one out of every 6.5 people get a social security check. But what we have done is combine Mahoning and Trumbull Counties because it constitutes most of Congressman Traficant's District. Combined Mahoning and Trumbull Counties, out of ever 5.3—and I do not know how you get 5.3 of a person, but out of every 5.3 people, one person is receiving a social security check and that means for his combined district, you are talking about approximately 20 percent of the people in these two counties receive a social security benefit.

How does that relate to infrastructure needs? The needs are there, the dollars may not be. Those are not people in the work force, those are people who are receiving a benefit of some type.

You get to over 65, the over 65 people, one out of every 7.4, every 7.4 people in Mahoning and Trumbull Counties, one of them is over 65 years old. Compare that to the national figure, it is one out of every 8.8. Now that does not sound significant, but that is a dramatically larger number of aged people in the population in these two counties.

Disabled beneficiaries—we are not talking about disabled people, we are talking about disabled workers, I want to make that point. These are people who have worked, contributed, paid into the taxes of this country. Disabled workers, Trumbull, Mahoning County, out of every 76 people in Trumbull and Mahoning County, one of them is a disabled worker. How does that compare nationally? Well nationally, one out of every 87—we have one out of every 76, the nation has one out of every 87 who is disabled.

These are people who have infrastructure needs. They need good water supplies and systems and so forth. And I think when we given you—you know, it is hard to talk about statistics, I think they are easy to look at. We have tried to summarize those in a fashion that would indicate that this district is unique in some of its needs.

With that, I thank you for the opportunity to be here today.

The **Chairman**. Thank you, Mr. Emanuel.

Ms. Murphy.

Ms. **Murphy**. Thank you, Mr. Chairman, Congressman Traficant, my name is Martha Murphy, I reside in Youngstown, Ohio and I am employed as the Director of District XI Area Agency on Aging.

Thank you for the opportunity to speak to you today in regard to some needs of older persons.

The 65 plus population in this country has increased more than twice as fast as the rest of the population in the past 20 years. It is projected that the old old, those 85 years plus, will quadruple in size between now and the year 2030. These figures indicate that we, as a nation, are not only getting older, but that older persons are themselves living longer.

A goal of the Older Americans Act of 1965, as amended, is to keep persons in their own homes as long as possible. In order to maintain proper living conditions and provide quality services, area agencies on agencies plan, coordinate and fund programs in cooperation with other federal, state and local programs. Area agencies devise plans to assess and meet needs to the best of their ability. Such needs are identified and determined as a joint effort of the older persons themselves, by surveys and information based on the local service statistics.

In our area, District XI, transportation continues to surface as the number one priority need. Homebound elderly, particularly the frail elderly, living alone must have dependable ways to get to physicians, to grocery stores and elsewhere. Low income persons do not have the ability to pay for taxi rides. Frail persons lack the physical ability to use public transportation.

For these and for others who have independent access, decent roads and highways are necessary, not just for reasons of safety but for a sense of security and yes, for lower repair costs for those on a very limited budget.

Additional needs of older persons could be met by in-home services such as chore, homemaker and home maintenance. Physical needs require availability of home health, nursing and nutrition services and in some cases day care and respite. Important to the well-being of our older constituents is also quality case management. The newly implemented PASSPORT program in Ohio will be a step in that direction, but the dollars slotted for us are only a beginning for the proposed seven percent Medicaid eligible clients.

The Older Americans Act reauthorization is scheduled to occur in 1991. At this time the allocations enabled by the current legislation have not kept pace with the growth in our numbers of older persons. This problem, coupled with the constraints imposed by Gramm-Rudman, have caused inadequacy for the aging network to meet its needs. It is urgent that the federal government meet the needs of its elderly constituents, particularly those low-income and minority individuals who must turn to us for help.

Congressman Anderson and Congressman Traficant, I plead that you consider older persons as a priority in your deliberations at the Congressional level and that you use your influence upon your colleagues so that they too will consider the needs and wants of this most deserving segment of our society.

And I thank you for your help in the past.

The CHAIRMAN. Thank you, Ms. Murphy.

I want to thank the entire panel for your presentation. I found your comments most contributing and interesting.

When speaking of infrastructure, we refer to it as being at the very core of our Nation's standard of living. There is obviously a direct link to public safety and to the creation of jobs and higher take-home pay. Do you see as clear a link between the need for more infrastructure investment and the benefits to be gained for the elderly and for those who are living on social security?

Mr. **Gunter**. If you do not mind, I will respond. Yes, I think there is a definite connection. I think infrastructure is really the basis from which most other things are built. Infrastructure leads to better jobs, more jobs, more employers and this in turn leads to better living conditions for anybody residing within a community. I think it all goes together.

Mr. **Emanuel**. I also would like to respond to that question just to say that certainly our senior citizens, our disabled people, have concerns, many concerns that the average American perhaps does not have. They are more vulnerable and certainly they worry about the safety of their roads and they worry about a safe drinking water supply and they worry about safe and adequate sewerage and they worry about safe bridges. Those are worries that they should not have in this society. We would hope that those things could be alleviated from them. Certainly if they have the means for transportation and the means for safe water and sewerage supplies, they are going to feel better about themselves and enjoy the years that they should be enjoying, their senior years, without worrying about whether there is going to be an adequate water supply or not.

The **Chairman**. Jim.

Mr. **Traficant**. I wanted to ask these witnesses here to let you know, in addition to the last panel, the high ratio of seniors receiving social security. Not all of them are that well off. To show you how impacted this area has been by the economic demise of the steel industry, showing that if you have this high a concentration of social security recipients—the Director of the local welfare department was not able to testify here, but it would also compound it and I want to place—keep open his statement for the record, Attorney Robert Douglas, helping the Services Director of Mahoning County, for this record, to show you the high number of welfare recipients, social security recipients, that there just is no tax base for match, there is no tax base for the contributions from the local community that many other areas are able to afford. Therefore, to show and to impress upon the Committee the need for specific federal response in an area like this. Both of these directors of the social security offices are doing a real good job, I have not had a complaint. I know some Members of Congress who get a lot of complaints. They do a good job and there are a lot of people who are concerned about social security. And District XI Area Agency on Aging, Martha Murphy for many years has been an advocate, and she knows the needs.

So the point I am making with infrastructure is we do not have the money for match, we need a special federal emphasis and I think that this is just supporting documentation of that economic hardship for local tax base and other incentives like that, Chairman.

I have no specific questions. I want to thank them for coming, I know they waited a long time, but I wanted them on the record.

The **Chairman**. Thank you very much for your presentations.

We are getting toward the end. Our sixth panel is Charles Syak, President and Chief Executive Officer of Syro Steel in Girard Ohio and David Lewis also of Syro Steel in Girard, Ohio.

TESTIMONY OF CHARLES SYAK, PRESIDENT AND CEO, SYRO STEEL AND DAVID LEWIS, SYRO STEEL, GIRARD, OH

Mr. SYAK. Good afternoon, Chairman Anderson, Congressman Traficant. My name is Charles Syak and I am Chairman of the Board and CEO of the Syro Steel Company located here in Girard, Ohio.

I thank you for inviting me to address you on the subject of our nation's infrastructure needs, but first let me commend this Committee for traveling throughout the country seeking a first-hand view of the economic fiber of the many diverse elements that go into building of one of the world's most prized public works projects—the self-funding interstate highway system.

I am especially pleased that the Congress would come to Youngstown, Ohio to personally view and hear from the people who make up one of the most potentially dynamic economic regions of the country. For many years this area was one of the nation's leaders in the production of steel and other basic building blocks necessary to create and maintain an economically viable infrastructure.

Mr. Chairman, the robust economy of the steel belt has turned into the sluggish economy of the rust belt.

Is it coincidence that our productivity and growth and economic expansion disappeared at the same time that the rate of our national public investment in the infrastructure fell?

I do not think so. There is a direct link between public investment in our infrastructure and our economy.

Mr. Chairman, infrastructure and safety are a part of our economic well-being. The Syro Steel Company has been involved in helping to build our nation's transportation infrastructure for over 35 years. Products such as guard rail, bridge rail, steel bin walls, corrugated sheets for overpass and underpass structures, crash barriers, sheet pile as well as specialty products for the nation's railroad car builders and barge builders have been an integral part of our nation's highway, bridge and transportation system since the inception of the interstate highway system. Further, an ongoing R&D program devoted to highway safety is a top priority at Syro.

Today, I would like to address our nation's infrastructure needs for highway and bridge safety.

Mr. Chairman, as you know, Title 23 of the United States Code governs the federal-aid highway program and section 152 was enacted to eliminate hazards associated with our highways. This safety construction program is appropriately known by this Committee as the hazard elimination program.

The hazard elimination program is designed to improve safety along public roadways and to reduce accident and fatality rates associated with general roadside hazards. It is comprehensive and authorizes a diverse set of projects. Section 152 carries out its mission through the use of several mandates. Since this Committee is aware of these mandates, they need not be addressed at this time.

As to the funding, let me say that this Commission has authorized $170 million per year to be apportioned to the states for section 152 projects. The federal share of costs associated with projects authorized in accordance with section 152 is 90 percent.

A disturbing fact is that some states have many, many millions of unobligated funds just sitting in these accounts. Other states have literally spent all of the funds appropriated to them under section 23, section 152.

What are the accomplishments of our safety programs including section 152, the hazard elimination program?

Truly incredible successes have resulted since 1974. FHWA estimates indicate that safety projects are responsible for saving over 55,000 lives and preventing over one million serious accidents. Additionally, fatal injury and fatal-plus-injury accidents have been reduced by 47, 22 and 23 percent respectively.

What is the cost?

It has cost approximately $338,000 per fatal accident and $13,600 for fatal-plus-injury accidents reduced. The surprising success of this program, combined with the relatively low cost of that success, makes you wonder why Section 152 funds sit idle in the unobligated account of some of the aforementioned states.

The Surface Transportation Assistance Act of 1986 expires at the end of fiscal year 1991. The interstate system will also be completed. New legislation, based on hearings just like this one, will reflect necessary changes in America's transportation needs. Without a doubt, the hazard elimination program reflects a wise investment that this Committee made to benefit our nation's roadway users. We have a good program that has saved lives, reduced serious injuries and personal property damage. I strongly recommend that this Committee extend this program, as is, in the forthcoming federal aid highway act of 1991. Gentlemen, it is working, it ain't broke, so let us not attempt to fix it. If anything, try to squeeze some additional dollars into the program so that the safety benefits we enjoy today may be further enhanced and shared by the highway using public.

The Secretary of Transportation Skinner has indicated that the new transportation policy should contain a highway plan designed to carry us into the next century. He advocates a plan that would eliminate the hazard elimination program and introduce a safety system with very little federal control.

Can we afford to eliminate section 152 program?

I think not. Section 152 is a highly successful safety program. The broad diversification of safety projects implemented under 152 make the program a linchpin to the entire highway safety movement.

To splinter our nation's highway safety into 50 individual programs would do irreparable damage to our nation's highway safety system. Federal control will provide a unified effort for research and development, reduce costs, and maintain the necessary state of the art as it is developed. As a manufacturer, I cannot conceive of 50 variations of a single specification achieving the desired results, including cost savings. The need to continue the program is illustrated by the constant reduction in accidents and deaths, combined with the ever-present need to upgrade and improve the roadways.

To allow section 152 to be dismantled would constitute a serious blow to this Committee's enviable record in support of highway safety.

I urge you to reauthorize the hazard elimination program and include highway safety at the top of your list of infrastructure needs.

Thank you, gentlemen.

The CHAIRMAN. Thank you. Mr. Lewis.

Mr. LEWIS. Mr. Syak has——

The CHAIRMAN. That was it. All right, then we will go to our questions.

I want to thank Mr. Syak and Mr. Lewis, we appreciate your comments.

First, as a manufacture of highway guard rails, your business might produce more rails and your revenues could increase as more and safer highways are constructed or rehabilitated. However, on the other side of the balance sheet, how important is adequate infrastructure to your cost of doing business and your ability to produce, compete effectively and earn a profit?

Mr. SYAK. Dave, could you help me out on that? Could I ask you to repeat that please? I temporarily got lost.

The CHAIRMAN. Sure. As a manufacturer of highway guard rails, your business might produce more rails and your revenues could increase as more and safer highways are constructed or rehabilitated. However, on the other side of the balance sheet, how important is adequate infrastructure to your cost of doing business and your ability to produce, compete effectively and earn a profit?

Mr. SYAK. Well to begin with, we feel that we have a very economical operation. We have been in the guard rail business for approximately 40 years. Let us say it has been the life of the highway act, and we feel that we have contributed and that there is an ongoing need for highway safety, of which we feel we are a great part of. And highway safety is not limited to guard rails, it is limited to roadside objects, it involves the potential of flooding, it involves the potential of saving lives with let us say barriers, it involves the potential of saving lives in the structures that we build such as corrugated pipe.

The CHAIRMAN. In other words, do you not depend on a good infrastructure as a manufacturer and businessman, irrespective of what it is you produce?

Mr. SYAK. Yes, we do.

The CHAIRMAN. You have to transport things and you want to do it economically?

Mr. SYAK. We do, we have to transport things and we have to ensure ourselves, number one, that we have products that will withstand the rigors of heavy traffic, floods, fire and what-have-you. And we feel that we are a contributor to the national highway program with the many areas in which we contribute in terms of safety on our highways—not necessarily only guard rails, but the many areas such as barriers, bridge railing, corrugated culverts.

I would like to defer to Dave, if he could elaborate a little bit.

The CHAIRMAN. Mr. Lewis.

Mr. LEWIS. Yes, Chairman Anderson. I was asked a question earlier today if I minded being last and I said no, I do not, because it was five years ago that I was last testifying in front of you for the current surface transportation bill.

The CHAIRMAN. Good.

Mr. LEWIS. And at that time we were asking for addition for a couple of other safety products. One being an impact attenuation device, one being an energy absorbing device that could be placed on our highways.

I must share with you now the Anderson story, because the first device that was installed or the first group of devices that were in the State of Indiana, it was hit a year or two later by a couple by the name of Anderson. He was a man that was 72 years of age, had just gotten married and at 12:00 noon, he and his wife were traveling, he drifted off the interstate, hit this product at high—posted speeds—and they both walked away from the accident.

So I guess the point that we are making is that these things do work. These things that we worry about and we concern ourselves with spending the taxpayers dollars, in fact do work when put out on the highway under the system that is presently there.

The CHAIRMAN. Mr. Traficant.

Mr. TRAFICANT. Mr. Chairman, this is perhaps one of the finest manufacturers of safety infrastructure devices in all of America. I asked them to come here, even though I know it is late in the day, because I wanted specifically on record the testimony of Mr. Syak. If we are able to expand section 128, that is going to safe an awful lot of lives. What Mr. Syak and Syro Steel, Dave Lewis, are concerned is the Secretary of the Department of Transportation has his eyes on eliminating section 152, the hazard elimination program. He wants to throw it over to the state and everybody is cutting back, everybody wants to deregulate, everybody wants to take the federal share out. We are talking about lives.

I wanted on record his particular testimony because I think that would be one of the worst policies Congress could let this administration proceed forward with, let along, God forbid, be successful with, to eliminate that program. I want to make sure—Mr. Esposito and I have already talked, that we look to see if we could safeguard to ensure that, get enough votes in the Committee to prevent that type of fragmentation. And second of all, maybe even to bolster that program, because number one, the bottom line, it has saved lives. And every time Mr. Syak has offered testimony through he or his staff, including Mr. Lewis, even though they deal in that particular regard, their information has served a practical purpose because it has helped in the long run to save lives—in a very cost-effective manner, I might add.

So I wanted them here because I am concerned about section 152. I think his testimony is not only appropriate, but I think it should be the yardstick by which Congress ends up evaluating that administration proposal.

That is really all I have to say, except I want to thank them for participating and helping to make an expanded section 128 be the law. They need a pat on the back for that, Mr. Syak and his operation. So that is really why I had them here, because Mr. Skinner is attempting to make that move and I wanted you as Chairman to understand that and understand the significance and how it is going to relate to the states. And I think that is a real important issue to be brought to our Committee. If we could get your support, it would be one tremendous shot in the arm.

So that is all I have to say, Mr. Chairman.

The CHAIRMAN. Well thank you very much, Mr. Syak and Mr. Lewis, for your presentation.

We have two more, one at a time here, our next witness is Jerry Bostocky, Vice President, National Sales of the B.T. Alan Fireworks.

[The prepared statement of Mr. Syak appears on p. 742.]

Mr. TRAFICANT. I would just like to say this, I have this panel here—this is unusual and kept to the end here and we have also a representative from labor that I think is important for you to understand. I have asked this group to come forward now, they have a specific problem within our area, that deals with specific policy and interpretation of law. This particular group is going to need an understanding by our Committee ultimately because I believe they reflect a problem which is a microcosm of greater problems that can affect individual companies involved with the transporting of sold goods.

We have here present today the Chief Executive Officer, Bruce Zoldan of the B.J. Alan Company and he is here represented with his counsel and his staff.

I just wanted to say that. We are working on this, we are trying to get the help, but I thought specifically I would like it incorporated into a committee meeting record.

With that, I turn it back over to you.

TESTIMONY OF JERRY BOSTOCKY, VICE PRESIDENT, B.J. ALAN CO., YOUNGSTOWN, OH, ON BEHALF OF BRUCE J. ZOLDAN, PRESIDENT, B.J. ALAN CO., ACCOMPANIED BY RICHARD STREETER, ATTORNEY FOR B.J. ALAN CO.

The CHAIRMAN. Well I introduced Mr. Bostocky. And Mr. Zoldan is the third guy?

Mr. TRAFICANT. Yes, this is the attorney.

Mr. STREETER. Mr. Anderson, I am Richard Streeter and I have represented this company for the last three years in a battle with the ICC which you are going to get to hear about now.

The CHAIRMAN. Very good, thank you.

Mr. BOSTOCKY. Mr. Anderson, also, Mr. Zoldan is just recovering from a bad cold, so he has asked me to state our testimony for you today.

As you stated, I am Jerry Bostocky, Vice President of B.J. Alan Company located here in Youngstown, Ohio, and obviously I would like to take this opportunity to first thank you, Chairman Anderson, and your Committee and Congressman Traficant for giving us the opportunity to address your Committee this afternoon regarding a significant problem our company has been experiencing with the Interstate Commerce Commission.

I was pleased to hear you reiterate to Congressman Traficant that besides your career as a professional race car driver, that you also had time to become a successful businessman in that period of time. We too have been striving to achieve that title and up until 1987 felt that we were doing a pretty good job in getting there.

Unfortunately now, we are faced with a very, very serious problem which I have prepared a written statement for your review and would briefly like to just acquaint you with the highlights of that presentation.

Although our company is a small family-owned company, we are recognized throughout the United States as one of the largest distributors of common fireworks in the U.S. By definition, Mr. Chairman, the common fireworks have been found by the United States Consumer Products Safety Commission to be suitable for use by the public.

From our beginning in 1973, our company had sales of around $3,000 in revenue with one employee and we have steadily expanded our sales and our abilities and through 1987, we have grown to a gross revenue of $23 million and well over 400 employees. And that is all located right here in Youngstown, Ohio.

Since that time, our company has experienced a series of setbacks and they are directly attributed to the refusal of the Interstate Commerce Commission to perform the enforcement functions that were given it by the Interstate Commerce Act. As a result of the Commission's failure to act and to enforce the provisions of the Interstate Commerce Act which contain the common carrier obligation, B.J. Alan, in 1990 has total gross revenues of only $11 million and our employment figure has dropped to under 200 employees. As you can see, we have experienced a 52 percent decline in our gross revenues and an almost equal, 50 percent loss of jobs in our organization.

Our wholesale operations, which involve sales, as an example, to many of the large retail establishments throughout the United States, such as Hill's Department Stores and Phar-Mor, Circle K Corporation, Southland's 7-11, has dropped from $15.3 million in 1987 to slightly over $10 million in 1990.

Our mail order business has dropped from $8.6 million to only $1.6 million. This represents a horrendous 81 percent decline in a four year period.

The reason for this drop is simply explained. B.J. Alan, like every other company which is involved in the American fireworks industry, built its service around UPS, United Parcel Service. Nevertheless, effective on the first of January in 1988, UPS abruptly refused to transport small parcels of common fireworks. Although members of this Committee as well as members of the U.S. Senate urged the ICC to suspend UPS' tariff and require it to perform services for the members of the fireworks industry, the ICC, under former Chairman Graddison, turned a deaf ear to our concern and our problem.

After we filed a formal complaint, the Commission initially ruled in our favor. However, by the time they were able to rule, the 1988 season, which is obviously up to July 4th, was over and lost. More importantly, after a change in the Commission's membership, UPS persuaded the Chairman, Commissioner Andrea and the new Commissioner Karen Phillips, to reopen. Although they found that UPS was discriminating against us, the Commission ruled against us when they employed a novel interpretation of the common carrier obligation which gives common carriers the discretion to pick and choose whom they will serve.

As we have repeatedly argued with the ICC, their test is an abrupt departure from the Supreme County's consistent interpretation of the common carrier obligation. In the first place, UPS was making a profit from the transportation of our common fireworks. Second, it clearly had the facilities to hale our traffic and in fact, it handled over 40 percent of our wholesale shipments and well over 90 percent of our retail sales prior to 1988.

Moreover, in years gone by, UPS has even solicited common fireworks shippers to support their applications for operating authority from the ICC.

Nor is safety an issue, Mr. Chairman. UPS has never experienced a safety issue in the transportation of common fireworks. Moreover, it continues to transport all other Class C explosives as well as black powder and smokeless powder. Black powder is a Class A explosive and smokeless powder is a Class B explosive.

UPS' nationwide embargo disregards the fact that the great majority of towns and cities and communities throughout the United States permit their citizens to use and enjoy common fireworks, especially during the 4th of July. That is a custom which dates back to our founding fathers.

More important, the test which the ICC employed in permitting UPS to abandon its service to the American common fireworks industry is contrary to the legislative history of the Motor Carrier Act of 1980. In fact, the leaders of this Committee made several explicit statements during the course of debate that the 1980 Act keeps the common carrier obligation and does not eliminate or weaken the carriers' obligation to perform the service they are authorized to perform under their certificate.

Simply stated, we have been devastated by the ICC's ruling. Not only have we lost UPS, but now we find that other carriers are taking the position that if UPS does not have to carry common fireworks, neither do they. This is the case throughout the United States and as a result of the ICC's handling of this case, I am aware personally of many companies smaller than ours that are on the verge of bankruptcy because of this ruling.

As a matter of public policy, I cannot understand how the ICC can permit a monopoly carrier like UPS to avoid its common carrier obligation. I am advised by my counsel that the Commission has never before permitted a common carrier to refuse a reasonable request for service when it plainly has the capacity and facilities to handle the request for service. I have also been told that the Commission has previously taken firm action to stamp out discrimination.

I must now as you why has the ICC taken this position. Did Congress change the law? My counsel advises me that the 1980 Act did not change the provisions of the Act which incorporate the common carrier obligation. If that is so, I must repeat my previous question. Why has the Commission taken this position?

Second, I must ask this Committee what can be done to convince the Commission that it has erred? Simply stated, if the UPS decision is not reversed, many in the legitimate fireworks industry will be ruined.

Today you have heard from a number of witnesses concerning the depressed nature of our area in Youngstown. Jobs are not available. Yet our company, B.J. Alan, is willing to employ twice as many and more employees than we have right now if we have the sales to justify it. Without adequate transportation for our small parcels, however, we will not be able to do so.

And for that reason, I request you to do what you can to remind the Commission that its duty is to protect shippers and consumers and not monopolistic carriers whose annual revenues exceed $12 billion.

Thank you, Mr. Chairman.

[Prepared statement of Mr. Bostocky (Mr. Zoldan) appears on p. 649.]

The **Chairman**. Mr. Traficant, would you comment on it?

Mr. **Traficant**. Yes, I want to say that this company has a real problem, a problem that we in our Committee have jurisdiction over, a problem that should be able to be resolved by bringing all parties together. One of the problems is it is very difficult to do that when it all occurs down in Washington. I brought them here to get your attention.

I am going to ask unanimous consent that it be understood that our legal staff would meet with their legal staff and meet with ICC to in fact attempt to resolve such an issue and that it be understood further that our legal staff or respective committees, in working with theirs, would work toward such result. Failing that, a legislative action if necessary could be taken, but to try and mitigate this. I ask unanimous consent that such close cooperation between counsel be established.

The **Chairman**. No objection, so ordered.

Mr. **Traficant**. I would also like to ask, Mr. Chairman—I know it is a busy schedule on the way back, before they leave they exchange cards, Mr. Esposito and staff here, to begin to work this out. I think that their record and what they submitted clearly clarifies for the record, but I think that if we are having this problem, here is what it means to us.

This is one of the largest companies of this nature in the country. Much of their activities is sparklers. These Class C fireworks pose no problem. By the nature of the position which UPS has taken, it hurts their viability of an open free marketplace and poses financial hardship which is not necessary—in my opinion. I could be wrong, but in my opinion at this point, certainly not.

What this means is here is a company that is creating jobs in a valley that is destitute. They could perhaps even double. They are going to be put in jeopardy of maintaining what they have, going from the number one robust company in the industry, in the country, so one that is going to suffer and perhaps be lost to us as a provider of jobs. So that is how important it is. It is a fine company, they want and need some help and Congress is going to have to provide it because UPS, ICC seem to be playing hardball and a little bit unreasonable at this point.

The **Chairman**. Mr. Esposito is our top counsel and he will work with you on that.

Mr. **Streeter**. Thank you. Could I point out that on Thursday I believe there will be a bill, H.R. 3243, which will be pending before your committee. We have taken the position before the ICC that the recent Supreme Court decision in *Maislin* v. *Primary Steel*, makes it very clear that the Supreme Court has told the ICC, where we, the Supreme Court, have interpreted a section of the Interstate Commerce Act for over 100 years and where Congress has not acted to change it, that the ICC may not come along and initiate its own policy statement to evade the will of Congress. And if we could get a statement to that effect, that this Committee stands behind the broad holding of the Supreme Court in that respect and that it expects the ICC to follow the dictates of Congress and not attempt to go off on its own, I believe that the new Chairman down at the ICC would get the message.

The CHAIRMAN. The meeting you referred to is a meeting, not a hearing, it is not a markup.

Do you want to comment briefly?

Mr. TRAFICANT. Are you scheduled to testify at that hearing?

Mr. STREETER. We are not scheduled to testify. I do have a statement that I have prepared for Mr. Zoldan, which I will be more than happy to present to you at that hearing.

Mr. TRAFICANT. Let me say this, Mr. Chairman, being it is a hearing and what might ensue from there—you know, there are an awful lot of hearings and a lot of meetings—I think this, regardless of what might transpire in that process, they need some address at this particular point now. I think what they are talking about is good and we will look into those efforts for you, but I want to see the legal groups together with ICC to try and remedy the problem that they face now with ICC. I think that is first and primary and second of all, as an adjunct to that, the types of things that counsel Streeter has brought forward. And I think it would be wise for their counsel to talk specifically with Mr. Esposito subsequent to this hearing.

The CHAIRMAN. Fine.

Mr. TRAFICANT. They need help, and I feel very, very concerned that we just cannot touch the magic wand, but we should be able to help them. I think UPS taking that stand is hurting us. And ICC should be a little more understanding here of the process.

I have no questions, Mr. Chairman.

The CHAIRMAN. Okay, thank you very much for your presentation.

Our final witness is Jack O'Connell, President of the Plumbers and Steamfitters Local Union 87, President of the Greater Youngstown AFL-CIO, Secretary of the Western Reserve Building and Construction Trades Council. Did I do all right there?

TESTIMONY OF MARTIN J. O'CONNELL, PRESIDENT, GREATER YOUNGSTOWN AFL-CIO COUNCIL

Mr. O'CONNELL. That is fine, Mr. Chairman. In fact, sometimes I have to look at my cards to see exactly where I am at.

I am Jack O'Connell, I am here as President of the Greater Youngstown AFL-CIO. I have submitted a written statement to your committee; however, I would just like to touch base on a couple of things.

Earlier in the day you made a statement that communities that deserve help, some were old and some have developing problems. I would like to point out to you that we are both. We are a community that has lost a steel mill, we have picked ourselves up by our bootstraps and have moved forward into the point that we are developing, we are developing in the transportation, the warehousing industry and other small programs. But we do need help, we do need help with the transportation system.

You know, Mr. Chairman, we tore down the rusting steel mills, but we need new highways now in that particular area to help us redevelop that land. We faced the problem that we had, we moved with it. You will notice, if you get a chance to look at the written report I did submit to you, that most every project I listed; the 7-11 connector, Kings Grave Road, et cetera, are regional projects. They are projects that benefit more than one community.

I would like to say that we in this community sometimes are at fault, we are at fault for our own parochialism and we have to look at the point that what is good for Trumbull County is good for Mahoning County, what is good for the City of Youngstown is good for the City of Warren.

I, with other speakers, would like to say that revenue sharing did help, taking it away from us did hurt. Also UDAG grants hurt our development in this community. But I think one message I would like to put to this Committee on behalf of organized labor in this valley, we have come back on concessions, we have come back by our bootstraps, we have moved various ways. But we have also realized that regionalizing our systems as we in the labor movement have had to make concessions, we believe that many of these cities, counties, many of the communities in the 17th District, have to look at regionalization. If they look at it as a form of concession, so be it, but we would like to urge your Committee to give priority to those projects that benefit more than one community. In other words, we are talking about the east end project in the City of Youngstown that has a direct benefit to the cities of Struthers and Campbell.

We are talking about an antiquated water system owned by the City of Youngstown, the City of Niles, that is going to require $165 million in order to upgrade it, to put it back in working operation, and we would like to say to this Committee that if that is one of the projects that is under consideration, we would like to see a string put on it that would regionalize the system and stop the debacle we had a year or so ago here where we could not send water to a project because we had a water line that was a quarter mile short and nobody was willing to move out there and it would have created approximately 600 jobs. That project right now is on hold. We do have to regionalize it, we ask your help in regionalizing this and helping us in that area, Mr. Chairman.

And that is it, sir.

[Prepared statement of Mr. O'Connell appears on page 694.]

The CHAIRMAN. Questions or comments?

Mr. TRAFICANT. Yes, I want to say this. Jack O'Connell has become a leader of the labor movement in this valley, and let me say something, he used a couple of words like "concession", like labor had to take look in real terms at some of the problems, and he has made some decisions and did some things that not everybody in labor liked, but he did things that were always, without question, for the betterment of this valley.

He has brought forward specific projects—and you know, I have seen all these public officials come through and all of them I had to ask for specifics, and I think this is why Jack has made such progress and has helped so much. He has listed a number of things for this particular valley that are integral to economic development and joining us in with the rest of this great nation. We are right in the middle of it. I think he specifies them, he listed them out and he is constantly working to make sure that the community supports a regional approach—what is good for one community is good for another community. And we have to prioritize.

So I wanted to make sure that you know that. And Jack has worked very hard to make sure the Hubbard Expressway, the access ramps, the University at Youngstown is moved forward, and I just wanted, knowing full well he put these things on the record, that is about it.

He has done a great job. Our labor people have taken it on the chin and they are trying to work, they are trying to mitigate this and he is trying to work to mitigate some of the problems between labor and management, and he has done a good job, Chairman.

The CHAIRMAN. I have one question for Jack. Jack, what is the union view of the roles of the federal, state and local governments and what kind of roles do you envision for the private sector in what we have been talking about here?

Mr. O'CONNELL. I have got to say I guess I do not understand your question, Mr. Chairman.

The CHAIRMAN. All of us are aware that in certain areas things are slow, in some places they are worse and they have all kinds of problems because of many things we have heard here today. There is always a question of what can we do to correct it and obviously we can spend more money, only we have to raise the money. So the question—I just thought that some of you might have some idea of what you thought we might be doing in the areas that would be of benefit to this type of an area.

Mr. O'CONNELL. I think you have benefited us in this valley in the past. You know, for many years in this valley, we contributed more dollars to the tax structure than we ever got returned. In the past few years, the government has stepped in and helped us. But we in the labor movement are firm believers that we have to do it ourselves. We in the labor movement are firm believers that where we need federal dollars, we need them for the overall benefit of the total community, not for the benefit of this city, this city, in competing one against another.

I think if I would say, as a person out of the labor movement and a taxpayer in this valley, that if the federal government could do one thing, it would be to abrogate their position on tax abatement to make it damned illegal all over the United States and maybe let the free market take us where it is going. We have taken an awful beating, we politicians in this area, we have taken an awful beating. You know, with tax abatement, we say yes to General Motors, we are going to give you some help, but we beat our own little buy that is going to build a corner grocery store, we beat him right over the head. You know, we do it in organized labor too. We give a 90 percent rate to General Motors for maintenance and some poor guy down the road is going to build a little building and we say you have got to pay 100 percent.

I think the government can help this valley and probably this whole country in general if we look towards expenditures as regionalized and also if we could look to some way to say that tax abatement, even though it is the only game in town and we do have to play that ball game, is a lousy ball game, sir.

The CHAIRMAN. Thank you. Do you have any comments or questions?

Mr. TRAFICANT. No. The only thing is this, looking at the revenue situation, Jack, and the read-my-lips reversal—from just briefly here, and I do not support new taxes, not income taxes. There may be some things there that they may look at. Could you speculate as to certain areas where they may look toward some revenue changes, that labor is looking at?

Mr. O'CONNELL. No, sir. The thing that labor fears the most is the word that seems to round every corner in Washington, that the gentlemen in Congress and the President is taking a long hard look at possible taxation of our fringe benefits in the labor movement. And I am going to tell you what, if you ever want to see a public uprising, you are going to see that if the health and welfare costs are taxed, if the pension benefits are taxed. We in the private sector and those that represent the individual and the little man have gone a long way in developing a pension plan that a man can retire in dignity, and it has always been structured on the point that when he receives that pension, he should pay for it.

The health care costs are going totally out of sight. The labor movement, I would say to you that if taxation comes upon the labor movement in the field of health care, that most of the people in the labor field, especially those in multi-employer plants, are going to say to hell with hospitalization, give the money back to the employer, let the hospitals and doctors chase them and let it go from there and see what is going to happen.

We in the labor movement are looking again for one thing, we are looking for guidance, some type of national health care. And I would point out to you that the five largest strikes in the past three years in the United States; Pittston Coal, et cetera, Ohio Bell, right on down the line, were—carried health care as probably the major issue in that contract. Yes, we do need help from the federal government in the field of health care, no question about it.

Mr. TRAFICANT. Well our Committee is not dealing with the health care issue, Jack, but in dealing with infrastructure and certain related things, I just wanted to make sure we put on the record your position. You have been pretty much on target with this valley—thank you. And I think if the Congress knew of your contributions, the nation would be thanking you as well.

I have no questions, Chairman.

The CHAIRMAN. Thank you, Jim. Thank you very much.

Mr. O'CONNELL. Thank you, Chairman Anderson and Jim.

The CHAIRMAN. And Jim, I want to ask this, I have been told that there is some other testimony that will come into the record and I want to just ask unanimous consent that the hearing record be kept open for three weeks, through August 6, for all statements or additional information.

So without objection, that is so ordered. We will take care of that part of it.

Mr. **Traficant**. John Ramun, President, Allied Erecting and Dismantling, Mr. Chairman, I ask unanimous consent that we extend an opportunity to an individual who is not scheduled here to testify, give him an opportunity to make brief comments to the Committee.

The **Chairman**. Will he make it brief?

Mr. **Traficant**. Yes, sir, he will have to, we have to catch a plane.

The **Chairman**. John R. Ramun.

TESTIMONY OF JOHN R. RAMUN, PRESIDENT, ALLIED ERECTING AND DISMANTLING

Mr. **Ramun**. Mr. Chairman, Honorable Traficant, this will be brief. I came here because I am interested in Youngstown and I am a local business operator, I am President of Allied Erecting and Dismantling on Poland Avenue in the area where the connector for 680 and the Center Street bridge is to be located.

I just wanted to—I could make a long story short by reading something that was in the paper Sunday. It is by an Ed Yusetsco, who runs Truck World, one of the major truck stops in the country on Route 80. And he said that he can check the pulse of the country's economy by watching the loads that pull through Truck World.

"Over the last year to 18 months, we have been seeing stuff from the Pacific basin. They used to ship through the Panama Canal and into the ports of New York and Baltimore. Now they dump everything in California and truck it across this country."

Well if you do that, you have got to go through Youngstown. And that is why infrastructure is so important to Youngstown. The only problem is you cannot get into Youngstown. You can get through it, but you cannot get to it. It is quite amazing. We have an area where there are several thousand acres of property where the steel mills were located on. And we are kind of unique because the private industry that owned them just spent about $50 million to remove them, so it is vacant land ready to be developed. And we need a half a mile road from 680 to connect them. And we could get 10,000 jobs in that valley if we could get the ramp.

And my comments are short and sweet, but the guys that have to truck out of that area right now, spend 45 minutes getting to 680 and just an hour from there to Pittsburgh, an hour and 15 minutes to Cleveland. We could be on that road in three minutes. We could get the warehousing that people want to put in this area located in our area. They want to be there, they just cannot get there.

That is why we need the infrastructure, that is why we need these roads.

The **Chairman**. Mr. Traficant.

Mr. **Traficant**. Mr. Chairman, this is a good local businessman and he is very familiar with the plight of our community's jobs. The corridor he is talking about is that old steel mill property which I addressed myself to trying to get the startup for the ramp back to 680. I have known John, I know his brother Michael and their family, they are very good people, and he is exactly right.

I just more or less, rather than ask a question—I do not know if John was here in the beginning when I thanked the Chairman, but we were able to get—and the Chairman did help—the startup money for the study to do the building plans, engineering design and to purchase the property to start to move that ramp from 680 down toward Center Street bridge. That is already—the startup money has been appropriated in a fund and also with the Hubbard Expressway startup. So we are also going to try and see if we can get some federal help for the bridge itself and other connecting links down there, and see if we can get, through the Superfund program, a look at the environmental concerns, so we can make that land attractive and get something done with it.

So I just would like to say, with the help of this particular Chairman, the Hubbard Expressway, we started out talking about it in 1952. We started on the riverbend project, trying to get ramps about a year ago, and with his help the money has been made available to get that thing moving. So there has been some start there, John. It is not going to be easy and it is not a done deal, but I would like you to know that.

I appreciate you being here.

Mr. **Ramun**. My only one item I would like to add is if we had that ramp next year, within two years you would have at least 5,000 people down there.

Mr. **Traficant**. Well I do not really think we will have it in the next two years, but I would say this, in the next few years we will be pretty much assured as to what that program will be. They do not develop all that fast, John.

Mr. **Ramun**. I understand that. I just wanted to——

Mr. **Traficant**. Let me tell you, the 12-month time period so far has been like a miracle and you can thank this Chairman for it, believe me. Without this Chairman, it would not have happened—period.

I would just like the record to reflect that, and I agree with him, Mr. Chairman.

The **Chairman**. Thank you.

Does that just about conclude it?

Mr. **Traficant**. Chairman, with that, I do believe that the Committee is finished.

The **Chairman**. Well as we conclude this afternoon's hearing, let me first thank the staff of Congressman Traficant and the people of the 17th District for their hard work and their hospitality. Most importantly, however, I want to thank Congressman Traficant, his dedication and commitment to infrastructure as it affects his district and the Nation as a whole is second to none.

When we get back to Washington, I look forward to working with him on what can be done to rebuild America and help the 17th District. Thank you, Jim.

The Committee is now adjourned.

Mr. **Traficant**. Thank you, Chairman.

[Whereupon, at 5:46 p.m., the Committee was adjourned.]

PREPARED STATEMENTS OF WITNESSES

TESTIMONY OF

James W. Abicht, Executive Director
Van D. Nelson, Associate Director/Youth Programs

WARREN-TRUMBULL COMMUNITY SERVICE AGENCY

FOR:

THE HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

Youngstown, Ohio

TESTIMONY OF JAMES W. ABICHT AND VAN D. NELSON
WARREN-TRUMBULL COMMUNITY SERVICE AGENCY

Before the House Committee on Public Works and Transportation

July 16, 1990
Youngstown, Ohio

GOOD AFTERNOON. IT IS INDEED AN HONOR TO TESTIFY BEFORE THE HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION, AND I AM INDEBTED TO THE HONORABLE JAMES TRAFICANT OF THE SEVENTEENTH DISTRICT FOR GIVING US THIS OPPORTUNITY.

MY NAME IS JAMES ABICHT, AND I AM THE EXECUTIVE DIRECTOR OF THE WARREN-TRUMBULL COMMUNITY SERVICE AGENCY, A COMMUNITY ACTION AGENCY THAT PROVIDES A VARIETY OF SERVICES TO THE LOW-INCOME POPULATION OF TRUMBULL COUNTY. THE AGENCY WAS FORMED AS PART OF THE SO-CALLED "WAR ON POVERTY" OVER TWENTY-FIVE YEARS AGO, AND ALTHOUGH WE HAVE MADE A GREAT DEAL OF PROGRESS, THERE IS STILL MUCH WORK TO DO.

FOR MANY YEARS, THE TRUMBULL COUNTY AREA WAS CHARACTERIZED BY A STRONG INDUSTRIAL BASE, ESPECIALLY IN DURABLE GOODS MANUFACTURING, BUT SINCE THE MID-1970'S, WE HAVE LOST LITERALLY THOUSANDS OF JOBS AND MILLIONS OF DOLLARS IN TAX AND RELATED REVENUES. WITH THESE LOSSES, THE NEED FOR PUBLIC IMPROVEMENTS, SOCIAL SERVICES, EMPLOYMENT AND TRAINING, AND RELATED EFFORTS HAS RISEN DRAMATICALLY. IN 1973, THE YOUNGSTOWN-WARREN AREA EMPLOYED ROUGHLY 92,000 PERSONS IN DURABLE GOODS MANUFACTURING, OR NEARLY HALF OF THE TOTAL EMPLOYMENT IN THE AREA. BY 1986, ANNUAL EMPLOYMENT IN MANUFACTURING HAD DROPPED TO 51,000 TOTAL WORKERS, A LOSS OF 41,000 JOBS!! BY 1990, ALTHOUGH MANY OF THESE JOBS HAVE BEEN REPLACED, MUCH OF THE REPLACEMENT HAS OCCURRED IN LOWER-PAYING, SERVICE-RELATED JOBS, MANY OF WHICH LACK HEALTH CARE AND OTHER BENEFITS. OVER THE FIRST FIVE (5) MONTHS OF 1990, WHILE UNEMPLOYMENT NATIONALLY AS AVERAGED ROUGHLY 5.2%, UNEMPLOYMENT IN TRUMBULL COUNTY HAS AVERAGED 9.1%, AND IN MANY OF THE LOWER-INCOME COMMUNITIES--SUCH AS IN THE SOUTHWEST SIDE OF THE CITY OF WARREN, UNEMPLOYMENT HAS AVERAGED OVER 25%, AND UNEMPLOYMENT FOR SPECIFIC SEGMENTS OF THE POPULATION, SUCH AS YOUTH AND MINORITIES, HAS AVERAGED IN EXCESS OF 50%!!!

TODAY, ALTHOUGH WE AT WTCSA ARE BY NO MEANS EXPERTS, OUR INVOLVEMENT IN THE WAR ON POVERTY IN TRUMBULL COUNTY ALLOWS ME TO FEEL COMFORTABLE IN PROVIDING YOU WITH SOME INSIGHT INTO A FEW AREAS THAT WE FEEL ARE RELEVANT TO BOTH LOW-INCOME RESIDENTS OF OUR COUNTY, AS WELL AS MEMBERS OF THIS COMMITTEE. THE FIRST AREAS DEAL WITH TRANSPORTATION AND GENERAL HOUSING, AND THE LAST AREA REVOLVES AROUND THE OVERALL NEEDS OF ONE (1) PARTICULAR AREA OF THE CITY OF WARREN. I WOULD LIKE TO BRIEFLY DISCUSS THE FIRST AREA --TRANSPORTATION--AND THEN I WILL INTRODUCE MY COLLEAGUE AND WTCSA'S ASSOCIATE DIRECTOR--MR VAN NELSON--TO DISCUSS THE LAST TWO.

THE WARREN-TRUMBULL COMMUNITY SERVICE AGENCY HAS BEEN INVOLVED IN THE FIELD OF TRANSPORTATION SINCE THE MID-1970'S, AND TODAY OPERATES A FLEET OF 12 VEHICLES PROVIDING TRANSPORTATION SERVICES TO OVER 15,000 COUNTY RESIDENTS ANNUALLY. THE REASON WHY WTCSA--AS WELL AS OTHER SMALLER TRANSIT PROVIDERS HAS ENTERED THE TRANSPORTATION MARKET IS BECAUSE TRUMBULL COUNTY IS THE LARGEST COUNTY IN OHIO--AND THE CITY OF WARREN IS THE LARGEST CITY-- THAT TOTALLY LACKS A PUBLIC TRANSIT SYSTEM. THE POPULATION OF TRUMBULL COUNTY TODAY IS ROUGHLY 250,000 PERSONS, AND THE POPULATION OF THE CITY OF WARREN IS AROUND 55,000. TRUMBULL COUNTY IS THE 2ND LARGEST COUNTY IN THE STATE IN TOTAL AREA, AND ENCOMPASSES 625 SQUARE MILES. THE TOTAL LACK OF A PUBLICALLY-FUNDED TRANSIT SYSTEM IN OUR COUNTY IS--IN OUR OPINION--AN ABERRATION THAT FREQUENTLY COMPOUNDS ALREADY SEVERE PROBLEMS IN JOB OPPORTUNITIES, AND ACCESS TO SERVICES, AND IS A PROBLEM THAT IS MOST DRAMATICALLY FELT BY OUR LOW-INCOME RESIDENTS. ACCORDING TO THE US CENSUS, TODAY THERE ARE ROUGHLY 35,000 TRUMBULL COUNTY RESIDENTS BELOW POVERTY, AND NEARLY 40% RESIDE IN THE CITY OF WARREN. IN 1988, WTCSA ESTIMATED THAT IN THE CITY OF WARREN ALONE, NEARLY 8,000 PEOPLE WERE IN NEED OF TRANSPORTATION SERVICES, WITH NEARLY HALF OF THAT TOTAL ENCOMPASSING LOW-INCOME RESIDENTS.

IN RESPONSE TO THAT DIRE NEED, WE CREATED THE COMMUNITY ACTION TRANSPORTATION SYSTEM--OR CATS--A FIXED ROUTE PUBLIC TRANSIT SERVICE THAT PROVIDES TRANSIT ACCESS TO 98% OF THE POPULATION OF WARREN, AND 99% OF ITS LOW-INCOME RESIDENTS. SINCE 1988-1989, CATS HAS PROVIDED TRANSPORTATION SERVICES TO 12,424 PERSONS, AND THROUGH THE GENEROSITY OF THE CITY OF WARREN, HAS RECEIVED FUNDING TOTALLING $30,000 TO OFFSET THE COSTS OF OPERATIONS. YET, SINCE CATS COSTS APPROXIMATELY $75,000 TO OPERATE PER YEAR, WE ARE LOSING MONEY, BUT AT LEAST WE ARE PROVIDING A VITAL SERVICE TO THE CITY. IN THE PAST, THERE HAVE BEEN MANY ATTEMPTS TO EXPAND MAHONING COUNTY'S PUBLIC TRANSIT SERVICES INTO THE AREA THROUGH WRTA, BUT FOR A VARIETY OF FACTORS--INCLUDING THE HIGH RATES OF UNEMPLOYMENT AND THE POOR ECONOMIC CONDITIONS OF THE COUNTY--VOTERS HAVE CONSISTENTLY DEFEATED LEVIES AIMED AT ESTABLISHING SUCH SERVICES, PRIMARILY BECAUSE THE REVENUES NEEDED FOR SUCH AN EXPANSION MUST GENERALLY COME--HISTORICALLY--FROM INCREASES IN TAXES. WITH THE SIGNIFICANT CUTS IN MANY FEDERAL PROGRAMS, COMMUNITIES LIKE WARREN HAVE LOST LITERALLY MILLIONS OF DOLLARS IN FEDERAL AND STATE ASSISTANCE, AND HAVE HAD TO INCREASE USER FEES AND OTHER TAXES IN ORDER TO OFFSET FEDERAL AND STATE INCOME LOSSES. CLEARLY, SUCH LOSSES, AND THE LACK OF PUBLIC TRANSIT, CREATE EXTREME BARRIERS TO OVERCOMING THE "PARADOX OF POVERTY", BARRIERS WHICH MOST OF US SIMPLY DO NOT UNDERSTAND. IN THE ABSENCE OF FUNDING FOR TRANSPORTATION PROJECTS THAT ARE TRULY GRASS-ROOTS IN ORIGIN AND THAT PROVIDE CLEAR AND DOCUMENTED SERVICES TO NEEDY RESIDENTS, THE "WAR ON POVERTY" CAN NEVER BE TRULY OVER, AND AS WE ENTER THE 1990'S, THE NEED FOR INNOVATIVE AND CREATIVE PROGRAMS LIKE CATS--IN TRUMBULL COUNTY AND ACROSS AMERICA, IS AS GREAT AS EVER.

AGAIN, I AM GRATEFUL TO THE HONORABLE JAMES TRAFICANT FOR GIVING ME THIS OPPORTUNITY, AND NOW I'D LIKE TO INTRODUCE TO YOU MY COLLEAGUE AND THE ASSOCIATE DIRECTOR OF WTCSA--MR VAN NELSON.

THANK YOU MR. ABICHT, AND I WOULD ALSO LIKE TO THANK CONGRESSMAN TRAFICANT AND THE COMMITTEE FOR ALLOWING US TO TESTIFY TODAY. AS MR. ABICHT STATED EARLIER, THERE ARE MANY BARRIERS TO OVERCOMING POVERTY--LIKE THE ABSENCE OF PUBLIC TRANSIT ACCESS--WITHIN THE COUNTY OF TRUMBULL AND THE CITY OF WARREN. IN ADDITION TO TRANSPORTATION, ONE OF THE MOST PRESSING PROBLEMS WITHIN THE COUNTY--AND ESPECIALLY IN THE CITY OF WARREN--IS THE LACK OF SUFFICIENT, ADEQUATE, AND AFFORDABLE HOUSING FOR MANY RESIDENTS, A PROBLEM WHICH IS MAGNIFIED FOR OUR CITY'S LOW-INCOME RESIDENTS.

ACCORDING TO THE 1980 CENSUS, THERE ARE ROUGHLY 84,000 HOUSING UNITS WITHIN TRUMBULL COUNTY, WITH 22,354 IN THE CITY OF WARREN. BASED ON CURRENT HOUSING DATA FROM THE LOCAL METROPOLITAN HOUSING AUTHORITY, THERE ARE 21 PUBLIC HOUSING PROJECTS WITHIN THE COUNTY, AND ASSISTANCE IS PROVIDED TO APPROXIMATELY 2,700 TOTAL FAMILIES, ENCOMPASSING NEARLY 9,000 TOTAL PERSONS. YET, BASED AGAIN ON CENSUS DATA, OVER 12,000 FAMILIES--35,000 PERSONS--ARE ELIGIBLE FOR SUBSIDIZED HOUSING COUNTY-WIDE, WITH NEARLY 5,000 PERSONS RESIDING IN WARREN ALONE. ACCORDINGLY, LESS THAN 20% OF THOSE PERSONS WHO ARE ELIGIBLE FOR SUBISIDIZED HOUSING ACTUALLY RECEIVE IT, LEAVING ROUGHLY 9,000 LOW-INCOME FAMILIES UNABLE TO RECEIVE ANY TYPE OF HOUSING ASSISTANCE. UNFORTUNATELY, MANY OF THESE PERSONS RESIDE IN THE CITY OF WARREN, AND AN UNUSUALLY HIGH PROPORTION TEND TO BE BLACK AND RESIDING IN THE SOUTHWEST/SOUTHEAST SECTION OF WARREN CALLED "THE SIXTH WARD".

GIVEN THE ALARMINGLY HIGH LEVEL OF FAMILIES WHO ARE ELIGIBLE BUT DO NOT RECEIVE SUBSIDIZED HOUSING WITHIN THE COUNTY, IT IS NOT SURPRISING THEN THAT MANY OF THESE FAMILIES ARE CONFRONTED WITH OTHER BARRIERS WHICH EFFECTIVELY PROHIBIT THEIR OWN SELF-SUFFICIENCY. CLEARLY, IF ALL OF YOUR INCOME MUST GO TOWARDS PROVIDING A ROOF OVER THE HEADS OF YOUR CHILDREN, YOU CANNOT AFFORD CONTINUING YOUR EDUCATION, BUYING FOOD, OBTAINING TRANSPORTATION SO THAT YOU CAN GO TO WORK, GETTING GOOD MEDICAL CARE, AND EVEN PAYING YOUR

UTILITIES. WTCSA CAN PROVIDE LIMITED AMOUNTS OF ASSISTANCE TO HELP WITH SOME OF THESE PROBLEMS OR BARRIERS, BUT THEY ARE FREQUENTLY ONLY TEMPORARY SOLUTIONS OR BAND-AIDS TO THE REAL PROBLEMS.

OVER THE PAST TWO (2) YEARS, ANOTHER--AND POTENTIALLY MORE SERIOUS PROBLEM HAS ARISEN IN THE "SIXTH WARD" WHICH ONLY COMPOUNDS ALREADY SEVERE HOUSING AND ECONOMIC PROBLEMS: THE FRANCHISING OF YOUTH/DRUG GANGS INTO MANY PUBLIC HOUSING UNITS. THE GANG PROBLEM HAS BEEN WELL DOCUMENTED IN MANY LARGER METROPOLITAN AREAS ACROSS THE COUNTRY, BUT I AM HERE TO TELL YOU NOW THAT WELL ORGANIZED GANGS ARE HERE--IN YOUNGSTOWN AND IN WARREN. THEY COME FROM DETROIT, OR L.A., AND EVEN FROM JAMAICA, AND THEY ARE HERE. IN ONE HOUSING PROJECT ALONE IN WARREN, THE VACANCY RATES HAVE BEEN ESTIMATED TO APPROACH 40% TO 50%. PEOPLE ARE AFRAID TO LIVE THERE BECAUSE OF THE PRESENCE OF GANGS. GIVEN THE ALREADY SEVERE SHORTAGE OF PUBLIC HOUSING IN OUR AREA, THE PROBLEM ONLY BECOMES WORSE, BECAUSE THE PEOPLE WHO ARE MOST AT RISK FOR BECOMING HOMELESS ARE LOW-INCOME, AND MANY ARE CHILDREN. IN 1990, WE AT WTCSA ESTIMATED THAT AT LEAST 25% OF ALL LOW-INCOME FAMILIES WHO DO NOT RECEIVE HOUSING ASSISTANCE OR SUBSIDIES ARE SEVERELY AT-RISK FOR BECOMING HOMELESS, OR OVER 3,400 PEOPLE IN THE CITY OF WARREN ALONE. THIS IS ANOTHER PROBLEM THAT HAS BEEN WELL DOCUMENTED IN LARGER CITIES ACROSS THE COUNTRY, AND IT IS ANOTHER PROBLEM THAT IS HERE, IN THE WARREN-YOUNGSTOWN AREA.

FINALLY, I WOULD LIKE TO TAKE A MOMENT TO DISCUSS ONE PARTICULAR AREA OF THE CITY OF WARREN THAT I MENTIONED EARLIER--THE SOUTHEAST/SOUTHWEST SECTION OF THE CITY CALLED THE "SIXTH WARD". IN 1986, WTCSA PRESENTED A STUDY OF THE SIXTH WARD TO LOCAL OFFICIALS, AND I HAVE INCLUDED A COPY OF IT TO BE INCLUDED IN THE RECORD. RATHER THAN REVIEW THE ENTIRE STUDY, I WOULD LIKE TO TAKE A MOMENT TO HIT THE HIGHLIGHTS.

THE SIXTH WARD CONSISTS OF 3 BASIC CENSUS TRACTS, AND HAS A POPULATION OF ROUGHLY 6,000 PERSONS. OVER 80% OF ALL PERSONS RESIDING THERE ARE BLACK, AND OVER HALF OF THOSE PERSONS ARE CHILDREN. THERE ARE FOUR (4) MAJOR PUBLIC HOUSING PROJECTS IN THE WARD--OUT OF 21 IN THE ENTIRE COUNTY--AND NEARLY 60% OF ALL THE RESIDENTS ARE BELOW POVERTY. NEARLY 40% OF ALL THE HOUSEHOLDS WITHIN THE WARD ARE HEADED BY A FEMALE, AND THE UNEMPLOYMENT RATE WITHIN THE WARD IS AT LEAST DOUBLE THE CITY'S RATE.

ALL OF THE SO-CALLED BARRIERS OR PROBLEMS THAT WE HAVE DISCUSSED HERE TODAY ARE CLEARLY EVIDENT--AND IN FACT MAGNIFIED--IN THE SIXTH WARD. IN ONE MAJOR HOUSING PROJECT IN THE WARD--WHICH HAS 200 UNITS--NEARLY HALF ARE VACANT AND BOARDED UP, DUE--AT LEAST IN PART--TO THE PRESENCE OF ORGANIZED GANGS AND RAMPANT DRUG PROBLEMS. LAW ENFORCEMENT CAN ONLY ACCOMPLISH SO MUCH THERE, BECAUSE THE ECONOMIC REALITIES OF POVERTY ACTUALLY ENCOURAGE SUCH ILLICIT ACTIVITIES. THE WARD HAS THE LOWEST PER CAPITA INCOME IN THE CITY, THE HIGHEST UNEMPLOYMENT RATE, AND THE HIGHEST POVERTY RATE. NEARLY 50% OF ALL SINGLE FAMILY DWELLINGS IN THE WARD ARE RENTALS, THE MEDIAN VALUE OF THE WARD'S HOUSING STOCK IS LESS THAN 60% OF THE CITY AVERAGE, AND NEARLY ONE-FOURTH OF ALL VACANT AND/OR DILAPIDATED DWELLINGS IN WARREN HAPPEN TO BE IN THE SIXTH WARD. YET, DESPITE THE HARSHNESS OF THIS DATA, THE WARD ALSO HAS ONE OF HIGHEST PER CAPITA EDUCATIONAL LEVELS OF ANY AREA IN THE CITY, AND THE NUMBER OF INDIVIDUALS WHO HAVE ATTENDED OR GRADUATED FROM COLLEGE IS DOUBLE THE CITY-WIDE AVERAGE.

POVERTY IS AN INSIDIOUS DISEASE THAT DOES NOT DISCRIMINATE ON THE BASIS OF RACE, RELIGION, SEX, HANDICAP, OR EDUCATIONAL LEVEL, AND ONCE THE DISEASE IS MANIFEST, IT IS NOT EASILY ERADICATED. THE LACK OF SUBSIDIZED HOUSING, A DETERIORATING HOUSING STOCK, AND THE LACK OF SERIOUS HOME-OWNERSHIP INVESTMENT--IN AREAS LIKE THE SIXTH WARD--HAS CREATED AN UNTENABLE AND UNMANAGEABLE SITUATION. THE ENTRANCE OF FRANCHISED GANGS--AND THE HIGH

INCIDENCE OF DRUG USE AND SALES--HAS COMPOUNDED THESE PROBLEMS. THE POVERTY IN THE SIXTH WARD--AND IN FACT THROUGHOUT THE CITY OF WARREN AND THE COUNTY OF TRUMBULL--IS VERY REAL. THE PARADOX OF POVERTY IS THAT POVERTY EVEN EXISTS, IN THIS, THE RICHEST AND MOST POWERFUL NATION ON EARTH. THE PARADOX IS EVEN MORE DIFFICULT TO UNDERSTAND BECAUSE WE KNOW THAT THE TOOLS AND STRATEGIES TO ERADICATE IT ARE PRESENT IN OUR SOCIETY. THESE SOLUTIONS ARE NEITHER EASY NOR INEXPENSIVE, BUT IN MY OPINION, INFRASTRUCTURAL IMPROVEMENTS THAT MAY REMOVE BARRIERS LIKE TRANSPORTATION, EMPLOYMENT, EDUCATION, AND HOUSING, MUST BE THE FIRST STEP.

THANK YOU.

SUMMARY AND METHODOLOGIES

The purpose of this analysis is to provide a useful data base for local officials of the City of Warren in order to ultimately generate an assessment of local conditions and needs. This analysis is limited to the geographic area of the City of Warren which comprises Ward 6. Located in the southwestern section of Warren City, Ward 6 is comprised of Census Tract areas 9205, 9206, and part of 9207. However, due to the inability to "break-up" census areas, only data from 9205 and 9206 are included in this analysis. The key indicators of this analysis include population, race and sex, poverty and income, age, education, employment and employment type, and housing. All information contained within this analysis has been obtained from the 1980 Census of Population, U.S. Department of Commerce, Bureau of the Census. For purposes of comparison, data compiled for the 6th Ward of the City have been compared to City-wide data for comparable characteristics.

GEOGRAPHY AND VOTER REGISTRATION

The 6th Ward of the City of Ward (the City is comprised of eight (8) wards) consists of ten (10) politically subdivided precincts located in the southwestern section of the City of Warren. As stated above, the ward is comprised of slightly more than two (2) census tracts. Approximately 5% of the total area of the ward is contained in tract 9207, with 95% contained within 9205 and 9206. The 6th Ward is roughly bounded by Market Street in north, Sixth Street in the south, Niles Road in the east, and Tod Avenue & Palmyra Road in the west. The 6th Ward also border some relatively unpopulated areas outside the City of Warren in the south-east and southwest, areas which are part of Howland, Warren, and/or Weathersfield Townships respectively.

According to the Trumbull County Board of Elections, the 6th Ward is comprised of roughly 3,676 registered voters, out of an approximate eligible population of 3,906. Thus, roughly 94.1% of all eligible voter living in the 6th Ward appear to be registered to vote. 52.9% of all registered voters are Democrats, totalling 1,945 persons, while 56 person or 1.5%, are registered Republicans. 45.6% of all persons living in the 6th Ward--or 1,675 persons--are registered as Independents.

OPULATION

FACTOR	WARD 6 TOTALS		WARREN CITY TOTALS		WARD 6/WARREN
	TOTALS	%	TOTALS	%	%
WHITE	1,167	18.9%	45,937	81.1%	2.5%
BLACK	4,970	80.4%	10,266	18.1%	48.4%
AMER. IND.	7	0.1%	54	0.1%	13.0%
ASIAN/P.I.	12	0.2%	180	0.3%	6.7%
OTHER	27	0.4%	192	0.4%	14.1%
TOTALS	6,183	100.0%	56,629	100.0%	10.9%

Summary: The 6th Ward has an approximate total population (1980) of 6,183 persons, or roughly 10.9% of the total population of the City of Warren. Of the total population of the Ward, 80.4% are black, while 18.9% are white. The total black population of the Ward--totalling 4,970 persons--is equal to nearly half of the total black population of the City of Warren as a whole (48.4%)

Key Indicators: Over eight (8) out of every ten (10) persons in Ward 6 are black; nearly ½ (48.4%) of all black residents of the City of Warren live in the 6th Ward.

AGE

FACTOR OR CHARACTERISTIC	WARD 6 TOTALS		WARREN CITY TOTALS		WARD 6/WARREN
	TOTALS	%	TOTALS	%	%
0 - 5 YRS OLD	603	9.8%	4,131	7.3%	14.6%
5 - 19 YRS OLD	1,957	31.7%	13,612	24.0%	14.4%
20 - 54 YRS OLD	2,512	40.6%	24,966	44.1%	10.1%
55 & OLDER	1,111	17.9%	13,920	24.6%	8.0%

Summary: Nearly one-half of all individuals who live in the 6th Ward are below the age of nineteen (19) years old, and nearly 60% of all residents are either below 19 or older than 55 years old. In short, the 6th Ward is comprised of either very young, or elderly residents.

Key Indicators: Nearly 15% of all city children below the age of 5 years old reside in the 6th Ward.

ITY

FACTOR OR CHARACTERISTIC	WARD 6 TOTALS		WARREN CITY TOTALS		WARD 6/WARREN
	TOTALS	%	TOTALS	%	%
IND. BELOW 125%	2,840	45.9%	10,420	15.4%	27.3%
IND. BELOW 150%	3,091	50.0%	12,665	22.4%	24.4%
PER CAPITA INCOM	$ 4,680	.....	$ 7,166	.....	65.3%
MEAN INCOME	$14,460	.....	$19,133	.....	75.6%
TOTAL HOUSEHOLDS	2,003	.....	21,027	.....	9.5%
HH W/SOCIAL SECUR	521	26.0%	6,101	29.4%	8.4%
AVE.ANNUAL $ (SS)	$ 3,843	.....	$ 4,232	.....	90.8%
HH W/WELFARE	620	31.0%	2,370	11.3%	26.9%
AVE.ANNUAL $	$ 2,048	.....	$ 2,843	.....	143.2%
FEMALE HEADS/HH	661	33.0%	2,804	13.3%	23.6%

Summary: Based on 1980 Census data, the 6th Ward consists of the two (2) highest poverty populations not only in the City of Warren, but in the entire county. Nearly ½ of all residents of the ward (45.9%) are below 125% of poverty; exactly 50% (3,091 residents) are below 150% of poverty, and thus are eligible for most anti-poverty services of WTCSA.

Key Indicators: NearLy 28% of the poverty population of the City of Warren reside in the 6th Ward, despite the fact that the Ward encompasses only 10.9% of the city's population. The per capita income in the ward is 65% of the city-wide average. Nearly 60% of all households in 6th Ward are receiving some type of governmental assistance, including either social security or welfare. In fact, nearly 27% of all families who receive welfare assistance within the City of Warren reside in the 6th Ward. Households who are headed by females (no male present) comprise 33% (1/3) of all 6th Ward households.

EDUCATION

FACTOR OR CHARACTERISTIC	WARD 6 TOTALS		WARREN CITY TOTALS		WARD 6/WARREN
	TOTALS	%	TOTALS	%	%
PERSONS 25 & OLDER	3,094	50.0%	33,682	50.5%	9.2%
0 - 8 YRS	803	25.9%	5,367	15.9%	15.0%
HIGH SCHOOL GRAD	1,408	45.4%	21,768	64.6%	6.5%
SOME COLLEGE	313	10.1%	1,858	5.5%	16.8%
NON-HI SCHOOL GRAD	1,896	61.3%	11,927	35.4%	15.4%

Summary: Over ½ of all ward residents over the age of twenty-five (25) do not possess a high school diploma, and nearly 1/3 possess less than nine (9) years of formal education.

Key Indicators: Despite the rather high levels of lack of formal educatio within the 6th Ward, oven 10% of all ward residents have attended or grad ated from college. This statistic is nearly double the City-wide rate, which indicates that on the average, roughly 5.5% of all Warren residents have attended or graduated from college.

EMPLOYMENT/EMPLOYMENT TYPE

FACTOR OR CHARACTERISTIC	WARD 6 TOTALS	TOTALS %	WARREN CITY TOTALS TOTALS	%	WARD 6/WARREN %
ELIG. LABOR FORCE	4,194	67.0%	42,916	75.0%	9.8%
ACTUAL LABOR FORCE	2,241	53.4%	24,735	57.6%	9.1%
EMPLOYED	1,666	74.3%	21,682	87.7%	7.7%
MANAGEMENT/PROF.	148	8.9%	3,699	17.1%	4.0%
SALES	199	11.9%	5,151	23.8%	3.9%
SERVICE	343	20.6%	3,328	15.4%	10.3%
REPAIR	119	7.1%	2,209	10.2%	5.2%
LABORER	846	50.8%	7,096	32.7%	11.9%
FARMING/FISHING	11	0.7%	119	0.5%	9.2%
NOT IN LABOR FORCE	1,953	46.6%	18,178	42.3%	10.7%
UNEMPLOYED	575	25.6%	3,053	12.3%	18.8%
UNEMPLOYMENT RATE	25.6%	-----	12.3%	-----	208.1%

Summary: There are roughly 4,194 persons in the 6th Ward who are eligible and "able" to work (age 16 and older), but only 2,241 actively participate in the labor force (53.4%). Thus, nearly ½ of all labor-force eligible residents choose to work, which may be indicative of a severe problem in the ward, such as "discourgage worker" syndrome. Similarly, the unemployment rate for Ward residents approximates 25.6%, which is roughly double the City-wide rate.

Key Indicators: As stated above, the high rates of non-participation in the labor force may be indicative of more serious, structural problems in the local labor market. Similarly, of those persons who do participate in the labor force in the ward, over half (50.8%) are employed in a labor-intensive industry, thus extremely vulnerable to cyclical economic changes Only 9% of all ward residents are employed in a management or professional environment or skill, as compared to 17.1% city-wide.

HOUSING

FACTOR OR CHARACTERISTIC	WARD 6 TOTALS	TOTALS %	WARREN CITY TOTALS	TOTALS %	WARD 6/WARREN %
TOTAL DWELLINGS	2,133	-----	22,354	-----	9.5%
OWNER-OCCUPIED	956	44.8%	12,992	58.1%	7.4%
RENTALS	1,021	47.9%	8,076	36.1%	12.6%
VACANCIES	156	7.3%	1,286	5.8%	12.1%
MEDIAN VALUE	$ 24,656	-----	$35,400	-----	69.7%

Summary: Despite having 9.5% of all dwellings within the city in the ward, the ward comprises nearly 13% of all rented dwellings in the city. This may be indicative of problems in the areas of development and investment in ward property and homes (absentee landlords).

Key Indicators: The Ward possesses the highest vacancy rate for dwellings within the City of Warren, and over 7% of all dwellings are vacant. As stated above, this could be indicative of a more serious "disinvestment" problem. Similarly, the median value of ward dwellings is about 70% of th city average.

Conclusions

Although it is extremely difficult to accurately analyze a specific segment of the population, with the assistance of 1980 Census data, voter information, and other available information, it is possible to create generalizations as to the nature of the population.

Based on the above sources, the "typical" resident of the 6th Ward of the City of Warren is probably black and female, and between the ages of 19 and 30 years of age. She is probably employed in a sales, clerical, or labor-related position, is unmarried or divorced, and has at least one (1) small child. She is also a high school graduate, and may have attended college, although she may not have a college degree.

In comparison to the City of Warren as a whole, Ward 6 is poorer, has a higher incidence of unemployment, has an older and less valuable housing stock, and has a higher percentage of youth and senior citizens than the City.

PRESENTED BY JERRY BOSTOCKY

STATEMENT OF BRUCE J. ZOLDAN
PRESIDENT, B. J. ALAN COMPANY, INC.
PRESENTED TO THE
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
OF THE HOUSE OF REPRESENTATIVES OF THE
CONGRESS OF THE UNITED STATES OF AMERICA
AT A PUBLIC HEARING HELD AT YOUNGSTOWN, OHIO
ON JULY 16, 1990

I wish to welcome Chairman Anderson and members of the Committee on Public Works and Transportation to Youngstown, Ohio and to thank Congressman Traficant for providing me with the opportunity to address this Committee.

My name is Bruce Zoldan and I am the President of B. J. Alan Company, Inc. ("B.J. Alan"), a small family business, which is headquarted here in Youngstown, Ohio. B.J. Alan is one of the nation's largest distributors of common fireworks. Its wholly-owned subsidiary, Diamond Sparkler Company ("Diamond"), is one of three remaining manufacturers of wire sparklers in the United States.

I became involved in the common fireworks industry in 1973 while I was in college. In my first year in the business, I realized sales of $3,000. From that point on, B.J. Alan experienced a steady growth in its sales until 1987, when it had overall sales from wholesale and retail operations of nearly $23 million. In 1987, B.J. Alan employed over 400 individuals in its Youngstown operations. During the height of the fireworks season, we even ran two full shifts to meet the demands of consumers who wished to purchase common fireworks for the Fourth of July.

In stark contrast to the above, in 1990, because B.J. Alan was unable to obtain reasonable, adequate transportation of its small parcels of common fireworks, its gross revenues fell to a little over $11 million and employed only 128 individuals. This drastic decline of $12 million in annual sales from 1987 to 1990 can only be attributed to the refusal of the Interstate Commerce Commission to enforce the provisions of the Interstate Commerce Act which require common carriers to provide service upon reasonable request, without discrimination. Instead, the Commission has turned its back on the American fireworks industry and relegated it to carriers whose rates effectively embargo the movement of small parcels of common fireworks.

B.J. Alan is engaged in both the wholesale and retail distribution of common fireworks. Thus we sell to retail establishments such as Hills Department Stores, Phar-Mor, Fishers Big Wheel, General Merchandise Services, Food Marketing, Hart/Big Bear, Holland Oil, Jaydon, Cotter & Company, Circle K, Southland Corporation (7-11 Stores), E. Z. Gregory, Associated Grocers, Assoicated Foods, Super Value, Louisville Toyhouse, K&I Toyhouse and others. In addition, we have a mail order catalogue which is directed to individual consumers.

While we have some shipments of large quantities to our wholesale accounts, the overwhelming majority of our shipments weigh less than 70 pounds. Because of the weight of our average shipment, we have always found that most common carriers are not interested in our shipments. While they will gladly take the large shipments that weigh in excess of 200 pounds, there was only one carrier that handled small parcels at reasonable rates, namely United Parcel Service ("UPS"). As a result, B.J. Alan effectively built its entire operation around UPS and depended heavily on it for the transportation of small parcels of common fireworks.

B.J. Alan has made major capital investments based on its reliance on UPS and projections of increased sales. The following briefly describes some of the expenditures and investments that were based on the continuing availability of UPS. Indeed, the physical plant and equipment for B.J. Alan's distribution business have been custom designed to mesh with UPS' service: (1) approximately $250,000 for a computer system that was custom-designed for the UPS computer shipping program; (2) approximately $17,000 for a Pitney-Bowes shipping computer which has the UPS manifest system installed in its software and was intended for UPS shipments; (3) a $64,000 telephone system installed to handle customer orders for UPS shipments; (4) $30,000 for a system of metal racks designed for handling UPS shipments; and (5) $300,000 for an enpanded loading dock.

In addition to these capital expenditures, B.J. Alan had over $4,000,000 in expenditures for the 1988 July Fourth fireworks season, including: $100,000 in advertising featuring UPS delivery service; $200,000 in catalogues; $30,000 in UPS shipping boxes; $6,000 in UPS labels and paper supplies; and approximately $4,000,000 in inventory.

Our projections, however, were not met. In November 1987, UPS published a tariff at the Interstate Commmerce Commission ("ICC") in which it announced that it would no longer transport common fireworks. It continues, however, to transport all other categories of Class C explosives, as well as black powder and smokeless powder. The latter commodities are classified generally as Class A and Class B explosives. UPS transports them as "flammable solids" under an exemption granted by DOT.

Even though various Members of Congress joined with the fireworks industry in voicing concerns with the discriminatory treatment afforded common fireworks, by a two-two vote, with one Commissioner abstaining, the ICC refused to suspend UPS' new tariff. As a result, B.J. Alan was forced to attempt to find other carriers. The search for a replacement for UPS, which is now in its third season, has consumed a tremendous amount of time, energy and resources. As of this date, no adequate replacement has been found.

UPS' withdrawal of its services has nearly destroyed the mail order portion of our business in its entirety. Our mail order business dropped from $8,568,859 in 1987 to $4,471,250 in 1988. Although the ICC required UPS temporarily to reinstitute service in 1989, our business failed to recover fully and mail order sales totalled only $3,493,620. In 1990, following UPS' renewed embargo of common fireworks, B.J. Alan's mail order business dropped to $1,605,050 in sales.

The decline in business can also be measured in terms of shipments. In 1987, B.J. Alan had 53,850 shipments. In 1988, this number decreased to 22,700 shipments. While the number of shipments decreased slightly to 18,265 in 1989, in 1990, we had only 7,786 shipments.

The loss of UPS' service also had a devastating impact on our wholesale business. In 1987, B.J. Alan enjoyed gross revenues of $15.3 in its wholesale business. In 1988, this fell to $14.3. Because of the problems encountered in 1988, the following season continued to experience difficulties as sales in this side of our business fell to $11.1 million. In 1990, we anticipate that wholesale revenues will be slightly in excess of $10 million.

In the past, UPS has handled about forty per percent of our wholesale business. This included most of B.J. Alan's sales to small retail establishments. In addition, UPS was used nearly exclusively to handle samll parcels of common fireworks destined to merchants who had run out of a particular firework.

In all instances, the contracts with the retail outlets are based on a guaranteed sales program. This means that B.J. Alan agrees to ship specific products according to state laws to each store that is signed up for the program. This is called a direct store delivery program. Product is placed in the store starting in May and any product that is left over following the

4th of July is returned to B.J. Alan. Thus the retail outlet pays only for the product it sells. B.J. Alan is responsible for all freight charges for all shipments to and from the stores. Also during the selling period, namely May through July, the stores often request additional shipments to replenish the items which have been sold. This is the restocking program. These orders were traditionally shipped via UPS. Now, B.J. Alan increasingly finds itself in the position of having to decline such orders because of the extremely high charges assessed by the LTL carriers and because those carriers, unlike UPS, will not move individual parcels in an expedited fashion.

As matters now stand, B.J. Alan cannot get its product to many of the retail merchants who have previously purchased common fireworks from B.J. Alan. For example, while Federal Express will handle a shipment to Hills Department Stores in Indiana, they will not handle a shipment to Hills in Michigan even though both states permit the sale of common fireworks by authorized retail establishments. This discrepancy is repeated throughout the United States.

Because of these problems, B.J. Alan has lost a significant amount of business to retail outlets which order limited quantities each year. For example, it no longer sells to J. C. Sales which was a major supplier to the Hook's Drugstores, Peoples Drugs, Super X Drugs and others. Under the arrangement with J.C. Sales, B.J. Alan would ship directly to the above-listed drugstores via UPS. When UPS withdrew its services, B.J. Alan attempted to create an alternative shipping pattern. However, this attempt failed when no alternative was found to replace UPS. Thus, B.J. Alan has lost this business.

All shipments to retail outlets are carefully monitored both by B.J. Alan and its wholesale and retail customers to ensure compliance with local fireworks laws. There is simply no way that either company will take the chance that shipments do not conform to the local regulations. However, because some states do not permit the full range of common fireworks or else have some local ordinances limiting common fireworks, Federal Express will not handle any shipments to such states. Thus, B.J. Alan is not able to satisfy its contractual agreements with its customers because it cannot find a replacement for UPS.

In addition, B.J. Alan is no longer able to provide samples to its prospective retail customers. In order to explain this further, it is noted that B.J. Alan has a national sales organization made up of independent sales representatives. In order for them to be effective in their sales presentations, actual samples must be presented to their clients. Given the broad geographic coverage that is entailed in this program, it is essential that B.J. Alan be able to economically distribute small samples. At the present time, B.J. Alan is unable to do this because of the lack of a carrier.

In addition, B.J. Alan and fifteen other major fireworks companies have formed an association called the American Fireworks Standards Laboratory. The purpose of this organization is to develop safety standards for all fireworks in tandem with the Consumer Product Safety Commission and the Department of Transportation. Under this program, product from both China and from domestic producers will be sent to the association's laboratory for testing. These shipments of samples will plainly involve small parcels for which no carrier is presently available. Also, the Consumer Product Safety Commission and many local and state fire marshals request B.J. Alan to send samples of various items to them for testing. Because of the inability to obtain reasonable and economical carriage, these voluntary efforts which are designed to enhance the safety of common fireworks are being hampered.

The adverse impact can also be demonstrated in terms of employment. In 1987, we employed over 400 individuals and had two full shifts a day during the season. This year, during the height of the season, we employed only 154 individuals. By the last week of the season, this number had dropped to 128 individuals. As reflected by the letter that was sent to the ICC by the National Association for the Advancement of Colored People, which is attached hereto, B.J. Alan has made a strong commitment to hiring minorities in Youngstown, Ohio. As a small family business, we feel that it is important to do everything we can to improve the community, especially hire young people who would otherwise be unemployed. Unfortunately, the ICC' refusal to require UPS to honor its common carrier obligation has prevented us from being able to hire as many individuals as in the past.

The problem is that the retail merchants, as well as individual consumers, are unwilling to pay the freight minimums that are assessed by most carriers. When they ship a small parcel, they expect to pay no more than the charge that UPS assesses. When they discover that a 10 pound parcel containing $25 worth of common fireworks is going to cost them $70 in transportation charges, when a similar parcel shipped via UPS would cost less than $5, they refuse to purchase.

As we have discovered, in the past when the ICC granted UPS operating authority, it often predicated its grant on the fact that the rates charged by LTL carriers effectively embargoed the shipment of small parcels. In addition, the ICC recognized that the higher rates of the LTL carriers were "prohibitively" high and discouraged the development of commerce.

The much higher rates also apply to Federal Express. In fact, the disparity between UPS and Federal Express has been admitted by UPS spokesmen. In the course of another, unrelated proceeding, UPS' counsel commented that one would have to be crazy to ship by air at a cost of $11.50 and above, when you could ship by UPS for $2.30. I hasten to add that to ship even the smallest parcel of common fireworks via Federal Express costs us in excess of $23.00. That same shipment via UPS would cost less than $4.00.

Even though we have presented the above facts to the ICC for its consideration, the ICC has refused to require UPS to reinstitute service. Although UPS has never claimed that it is not making a profit from the transportation of common fireworks, the Commission, after first finding UPS' refusal to transport to be unlawful, reversed itself and sanctioned UPS' embargo. In so doing, the ICC observed that the case involves discrimination. However, the Commission excused UPS from rendering service on the grounds that the common carrier obligation, in the eyes of the former majority, was modified by the Motor Carrier Act. According to the ICC majority, UPS now has the discretion to pick and choose among the shippers it will serve.

B.J. Alan respectfully submits to the Members of this Committee that the legislative history of the Motor Carrier Act of 1980 will be searched in vain for any indication that Congress intended to alter the common carrier obligation and to leave it to the discretion of common carriers to discriminate beteen the various shippers who are dependent upon a common carrier. To the contrary, nothing in the legislative history of the MCA indicates an intent to change either §§ 11101(a) or 10741(b). Rather, the legislative history affirmatively indicates that Congress did not intend to eliminate or weaken the common carrier obligation. Speaking in support of the House bill which became the 1980 Act, Representative Howard, the Chairman of the Surface Transportation Subcommittee, stated that:

> None of these provisions [of the 1980 Act "which provide for increased entry opportunities and removal of wasteful operating restrictions"] eliminate or weaken the carriers' obligation to perform the service they are authorized to perform under their certificate.

126 Cong. Rec. 15,583 (1980) (emphasis added). Likewise, Representative Shuster, ranking Republican Member of the Surface Transportation Subcommittee, "emphasize[d]" that:

> [T]his bill keeps the common carrier obligation to serve. It does not touch that. It keeps that. And that is fundamental.

Id. at 15,592. There is absolutely nothing in the history of the MCA to the contrary, or that indicates any intention to alter the standards governing "type of traffic" discrimination.

Furthermore, consistent with the Supreme Court's recent holding in Maislin Industries, U.S., Inc. v. Primary Steel, Inc., No. 89-624, decided June 21, 1990, slip op. at 18, if strict adherence to the common carrier obligation as embodied in the provisions of the Act "has become an anachronism in the wake of the MCA, it is the responsibility of Congress to modify or eliminate these sections." In summary, by implementing a policy that permits a "more relaxed common carrier obligation" that is dependent only upon the carrier's assessment of the circumstances at a given moment, the majority in UPS II overstepped the boundaries that have been placed on the Commission by the Supreme Court in Maislin.

Because the ICC has taken an approach which is contrary to the Act and over 150 years of Supreme Court precedent defining the common carrier obligation, B.J. Alan is suffering continued losses in its business. Since UPS has never shown that its transportation of common fireworks has caused it to lose any revenues, and because UPS plainly has the capacity to provide service to B.J. Alan, there is no reasonable reason to sustain UPS' discriminatory treatment of B.J. Alan and other members of the American fireworks industry.

It is true that a small minority of States continue to prohibit common fireworks. I hasten to add that B.J. Alan and other members of the American fireworks industry are not interested in forcing UPS to transport fireworks to such points. In fact, for many years, we worked with UPS and voluntarily agreed to an informal embargo to certain areas. Moreover, B.J. Alan has made it known to UPS that it would be willing to pay a reasonable surcharge to cover the return of any parcels that might be returned by consumers who, after ordering the parcels, changed their minds. UPS, however, has adamently declined to consider such a proposal.

Having said the above, however, there is absolutely no excuse for UPS to decline shipments of common fireworks to the thousands of villages and towns throughout the United States where ordinary citizens wish to carry on the tradition, dating from the days of John Adams, of exploding common fireworks on the Fourth of July.

Thus, this Committee is urged to make it clear to the Commission that it will not tolerate the Commission's indifference to the legislative history of the Motor Carrier Act of 1980 which clearly indicates that Congress did not remove the common carrier obligation. The Commission should be advised in no uncertain terms that, consistent with the Supreme Court's traditional test, a common carrier continues to have a duty to "serve all, up to the capacity of his facilities without discrimination and for reasonable pay." Michigan P.U.C. v. Duke, 266 U.S. 570, 577 (1925) (emphasis added).

If that principle had been applied in the proceeding before the ICC, B.J. Alan would not find itself on the verge of financial ruin. In addition, UPS would have enjoyed the revenues generated by its transportation of common fireworks.

Unfortunately, UPS is not the only problem that we face. On July 2, 1990 -- two days before Independence Day, we filed an antidumping petition with Elkton Sparkler Co., of North East, Maryland, against sparklers from the Peoples Republic of China. As basically the two remaining domestic sparkler producers, we decided to fight the PRC's irrationally low sparkler prices --

prices that are approximately half of our prices and well below our cost of production. Since the Chinese entered the U.S. market in the late 1970's, we have seen our share of the domestic market plummet from an approximately 80 percent share to a 20 percent share. American jobs have also been lost as we have been forced to cut production.

We are hopeful that the International Trade Commission and the Department of Commerce, the two government agencies that are handling the case, will confirm that the PRC is dumping sparklers in the U.S. and that we have been injured by the PRC's irrationally low prices. We have asked that 91 percent antidumping duties be imposed on No. 8 sparklers and 63 percent antidumping duties be imposed on No. 10 sparklers.

In closing, I wish to thank you again for coming to Youngstown and permitting me to address you. As Congressman Traficant is well aware, this area has been hard hit by the collapse of the steel industry. There is a tremendous need in this area to create jobs and to expand the local economy. We at B.J. Alan want to contribute to the development. Unfortunately, as the previous statements show, we are being prevented from doing so because of the Interstate Commerce Commission's refusal to enforce the Act. While I realize that two of the three Commissioners who voted against us have been removed from office, the newly constituted Commission has to this date proved to be unwilling to take a further look at the matter in order to reach a conclusion that is consistent with the intent of Congress. Thus, B.J. Alan must respectfully request the assistance of this Committee in order to bring an end to the battle and restore reasonably priced service to the common carrier industry.

The Honorable J. J. Simmons, III
Interstate Commerce Commission
12th. & Constitution Ave., N.W.
Washington, D.C. 20423

Re: MC-C-30093, B. J. Alan Company, et at. v. United Parcel Service, Inc. et al.

Dear Commissioner Simmons:

I am writing this letter to urge you to have the Commission reconsider its decision in the above-referenced proceeding. I want you to be aware that B. J. Alan Company has made a strong commitment to hiring minorities in Youngstown, Ohio. The jobs which it provides are essential to many young people who would otherwise be out of work because there are no other jobs in this economically depressed area. However, since the company is unable to ship its product due to UPS' apparent discriminatory refusal to handle common fireworks, it has had to reduce the number of people it can hire. This is harming many people who depend on the company for work during the fireworks season.

B. J. Alan is a friend of the N.A.A.C.P. and has worked closely with us in the past. We, therefore, ask you to do what you can to make sure that they are treated properly and that they receive a fair hearing.

Sincerely,

Willie R. Oliver

Willie R. Oliver
Branch President

Administrative Assistant to the Mayor

INFRASTRUCTURE AS IT AFFECTS ECONOMIC DEVELOPMENT
(Creation & Maintaining of Jobs)
IN THE YOUNGSTOWN AREA

INTRODUCTION

To the Hearing Panel: Thank you for the opportunity to present testimony. The viability of cities is inextricably linked to transportation, especially throughout the industrial, and now the technical, age. A good transportation system is necessary to bring manufacturers and buyers together. Therefore, businesses pay close attention to a City's transportation assets when making site selection decisions.

In the past years, emphasis on motor vehicle transportation and highway construction and freeway systems avoiding urban centers, encouraged suburbanization and caused decline in central cities. Recently however, policy makers are beginning to intentionally match transportation policies more closely to urban development goals. We feel that it is important that federal, state and local governments come together in common agreement in developing and improving local infrastructure to benefit economic development in our area, impacting positively job creation and retention.

LEVEL OF ECONOMIC DISTRESS

The economic trauma suffered by the City of Youngstown and the Mahoning Valley over the past two decades has gained national recognition, and while recovery has begun, much work remains to be done. The loss of 30,400 manufacturing jobs since 1979 has severely impacted the wage levels for local employees. The economic growth in service, retail and wholesale trade has failed to offset the loss of high wage manufacturing sector jobs. The most recent available unemployment and per capita income statistics show Youngstown still lagging behind the state and nation. As of April, 1990, (latest rate available) the unemployment rate for Greater Youngstown was 7.4 percent, compared to 5.9 percent for Ohio and 5.4 percent for the nation (source: Ohio Data Users Center). The 1985 estimated per capita income in Youngstown was $7,968.00 compared to $10,371.00 for Ohio and $11,861.00 for the national. The Council for Economic Opportunities in Greater Cleveland estimates the poverty rate in Mahoning county to be 18.4 percent, ranking it second highest among the 10 largest counties in Ohio.

This proposal outlines a strategic economic development planning process which would greatly enhance Youngstown's ability to encourage orderly economic growth and job creation.

PROPOSED WORK PLAN

The purpose of the proposed activities is to create additional opportunities for economic development through the development of a strategic planning process designed to: (1) identify potential industrial and commercial sites which currently have disadvantages related to issues such as lack of access, lack of other necessary public improvements, and restrictive zoning, (2) determine the feasibility of making the improvements and changes necessary to make potential development sites attractive, and (3) create the excitement and commitment necessary to effect the necessary changes.

Previous studies, partially funded by the Economic Development Administration and undertaken by the Youngstown Revitalization Foundation (YRF), indicate a need for additional quality industrial sites. One study revealed that while a substantial amount of vacant industrial land existed in Youngstown, the majority of it was either unimproved or occupied by obsolete facilities.* Surveys of existing manufacturers indicated a demand for quality industrial land of the type found in industrial parks. In most cases, manufacturers indicated a need for relatively small sites. Over 40% indicated a need for one acre or less; nearly two-thirds indicated a need for five acres or less.**

The proposed work program would build upon the aforementioned studies by assessing the relative feasibility of upgrading sites to establish priorities for city involvement, by formalizing a plan of action for site improvements, and by expanding the analysis to sites not currently zoned industrial (the YRF inventory was limited to industrial zoned land). The proposed process would help to ensure that the deficiencies in industrial land identified in the YRF study are corrected, and that the demand for small quality industrial sites documented in the YRF survey is met.

Rationale/Need:

The City of Youngstown has experienced considerable change over the past two decades. The loss of high-paying manufacturing jobs has had an impact upon the population, upon the tax base, and upon the neighborhoods. The City's population has declined from 140,909 in 1970 to 101,150 (est.) in 1988. Some previously solid residential neighborhoods have fallen victim to decline and disinvestment and are now characterized by abandoned structures and vacant lots.

Acknowledging these changes, the Mayor of Youngstown has indicated a desire to modify city development policy and legislation to more effectively utilize city resources and land. By adapting to change, and by creatively promoting the reuse of abandoned or underutilized land, economic development activities and job creation can be stimulated. Effectively adapting to change, however, requires careful consideration and analysis of the options. Examples of the types of issues and questions which have been raised include:

> Is land available, especially with freeway access, that is suitable for the development of light industrial, service or commercial enterprise, but which is restricted to less appropriate or less likely types of development?
>
> What can be done to encourage development on the largely undeveloped East Side in a manner which is compatible with existing neighborhoods?
>
> What are the viable alternatives for reuse of industrial land along the Mahoning River; how can access to this land be improved?

If these issues are to be addressed in an effective manner, the City must examine the technical elements involved.

Expected Impacts and Their Timing:

The proposed activities would have several positive impacts on economic development efforts in the City of Youngstown:

> Identifying potential sites for industrial or commercial activity, and outlining what needs to be done to make the sites viable, represents a first step toward increasing the City's limited inventory or marketable land. Possible City action includes direct intervention through land acquisition or capital improvements and supportive actions that encourage privately financed development.
>
> By systematically evaluating the advantages and disadvantages, the cost and benefits, associated with potential sites for development, the City can prioritize its development options and use its limited resources more effectively and efficiently.
>
> Encouraging involvement from local, state and federal government, specifically in infrastructure development, maintenance and development of land in strategic areas.
>
> The process itself would create enthusiasm and commitment. Resulting positive publicity should create an atmosphere of opportunity conducive to local new entrepreneurship and expansion, as well as to the attraction of outside firms.

In addition to the direct benefits of the proposed activities as discussed above, many indirect and long-term positive impacts associated with the development of a participatory planning process are anticipated.

SPECIFIC PLANNING ACTIVITIES/PROCESS

Technical Studies:

The overall purpose of the technical studies would be to identify and to systematically analyze potential industrial and commercial sites so that the City may take the steps necessary and appropriate to encourage economic development. Several sites have already been targeted for study; others are expected to emerge during the planning process. Examples of the areas to be studied, and the types of questions to be answered follow:

> Large tracts of industrial land, much of it formerly occupied by steel mills, lie unused or underutilized in Youngstown. This land represents potential sites for new development but many questions need to be addressed. For example: What are the current limitations related to lack of infrastructure and accessibility, what are the potential solutions, and are they

economically feasible? What is the likelihood of the land being contaminated by toxic substances and what would cleanup cost? Which sites could the City feasibly acquire, improve and market?

Lands adjacent to freeway interchanges are highly accessible and therefore represent prime sites for industrial or commercial development. A systematic study of land near freeway interchanges is necessary to determine answers to questions such as: What are the existing land uses? Have neighborhoods near any of the interchanges declined to the extent that relocation (of remaining residents) and reuse is warranted? Does zoning reflect current reality or does it need to be updated? What is the potential for and advisability of, related land acquisition by the City?

Other specific areas for the City will also be considered in the analysis of potential sites for industrial or commercial activity. One such area is the largely undeveloped section of the East Side in the vicinity of Lansdowne Airport and McKelvey Lake. Key issues to be studied in relation to this site include current limited accessibility and potential ties to the airport. A second such area is located within a declining residential neighborhood located just east of the campus of Youngstown State University. An analysis of the potential for encouraging new development related to the University's technology center is proposed.

SUMMATION

Again, we appreciate the opportunity of being heard by the panel involving what we believe to be one of the most important issues facing this administration. We conclude this document asking questions that all of us need to answer if we are to survive:

What are the scopes of influence of federal, state and local transportation agencies, and what part does each play in the revitalization process of our area?

How can we as an urban center foster closer working relations among transportation agencies and our local, state and federal agencies?

How can we work together as city, county, state and federal government to ensure that economic impacts are taken into account in making transportation infrastructure decisions in the future?

Perhaps the most pressing issue centers around how can we work together in a collaborative effort to complete the following infrastructure projects:

1. Hubbard Expressway from Albert Street in Youngstown to I-80, with interchanges at, and with upgrading of, Lansdowne, Liberty and Wardle.
2. Access to I-680 Southbound (on and off) from south edge of Youngstown at either Market Street or South Avenue.
3. Widening and upgrading of Martin Luther King Memorial Blvd. from the Madison Avenue Expressway to Fifth Avenue in Youngstown.
4. Widening and upgrading of U.S. Route 62 and S.R. 7 from Verona Avenue in Youngstown to City limits.
5. Widening and upgrading of Poland Avenue from Center Street to Alpine Street in Youngstown.
6. Replacement of the Credit Mobellier Bridge between Crescent Street and Bridge Street in Youngstown.
7. Expedition of the following project already programmed: New Center Street Bridge, with access to the industrial land along Poland Avenue; and completion of the South Avenue Bridge, one of the main arteries into the City of Youngstown.
8. How can local government expedite the expenditure of Federal Highway Trust Fund dollars for projects crucial to our very existence.

MAHONING COUNTY INFRASTRUCTURE MANAGEMENT STATUS, 1990

IN ORDER TO ADDRESS MAHONING COUNTY'S NEEDS REGARDING INFRASTRUCTURE MANAGEMENT, A STUDY WAS CONDUCTED.WHEN THE COST FACTOR PORTION OF THIS STUDY WAS COMPLETED, IT WAS DIFFICULT FOR OUR LOCAL OFFICIALS TO COMPREHEND THE AMOUNT OF MONEY NEEDED TO MAINTAIN OUR EXISTING LEVEL OF SERVICE, LET ALONE FINANCE ANY NEW OR EXPANSION PROJECTS. FURTHERMORE, THE MAGNITUDE OF THESE COSTS IS INCONCEIVABLE TO THE GENERAL PUBLIC.

AS PART OF THE STUDY, THE EXISTING MAHONING COUNTY INFRASTRUCTURE HAS BEEN PRIORITIZED ACCORDING TO NEEDS BASED UPON SEPERATE PAVEMENT AND BRIDGE MANAGEMENT SYSTEMS. THESE MANAGEMENT SYSTEMS ARE DOCUMENTED, REFER TO ATTACHMENTS ONE AND TWO THAT SUMMARIZE THE BRIDGE AND ROADS UNDER THE JURISDICTION OF THE MAHONING COUNTY ENGINEER.

THE PAVEMENT MANAGEMENT SYSTEM (PMS), DETAILS CONDITION RATINGS FOR MAINTENANCE ACTIVITY THAT IS NEEDED FOR EACH SECTION OF COUNTY ROADWAY AND EXPLAINS THE NECESSARY REPAIRS AND COSTS AT TODAY'S DOLLAR AMOUNTS. THE TOTAL DOLLAR AMOUNT FOR MAINTENANCE ACTION ON THESE ROADWAYS TO MAKE THEM ACCEPTABLE AND ADEQUATE IS IN EXCESS OF $185 MILLION, AGAIN FOR COUNTY MAINTAINED ROADWAYS ONLY.

TO ADDRESS THE MAHONING COUNTY BRIDGES, A SIMILAR MANAGEMENT SYSTEM ASSIGNS A FIGURE OF AN ADDITIONAL $70 MILLION THAT IS NEEDED IN THE NEXT 10 YEARS TO GET ALL 323 BRIDGES MAINTAINED BY THE COUNTY UP TO AN ACCEPTABLE LEVEL. THESE PROJECTS INCLUDE REPLACEMENT, REHABILITATION, AND GENERAL MAINTENANCE TO ALL EXISTING STRUCTURES SO THAT THE ANNUAL COST AFTER THE YEAR 2000 CAN BE MAINTAINED AT A LEVEL THAT IS SUITABLE ENOUGH TO SUPPORT AN ONGOING CYCLE OF MAINTENANCE.

TO SUSTAIN THE INFRASTRUCTURE, AN EFFICIENT DRAINAGE SYSTEM IS NEEDED. THE PRESENT DRAINAGE SYSTEM IS ANTIQUATED, ERODING, AND PARTIALLY INADEQUATE. IN ORDER TO KEEP PACE WITH GROWTH AND ECONOMIC DEVELOPMENT, THE WIDENING OF EXISTING ROADS WILL NECESSITATE NEW AND UPGRADED DRAINAGE SYSTEMS TO BE COORDINATED WITH THE PAVEMENT AND BRIDGE MAINTENANCE PROGAMS. THIS IS A NECESSITY BECAUSE THE CONDITION OF DRAINAGE FACILITIES IS A CONTRIBUTING FACTOR IN THE DETERIORATION OF THE OVERALL INFRASTRUCTURE SYSTEM.

PRESENT AND FUTURE TRAFFIC SAFETY NEEDS ARE ANOTHER OF THESE FACTORS. THE INCREASE IN THE VOLUME OF TRAFFIC NOT ONLY ABUSES THE ROADS THAT WERE NOT BUILT TO HANDLE THESE AMOUNTS, BUT ALSO CREATES UNSAFE CONDITIONS FOR MOTORISTS.

THE MAHONING COUNTY INFRASTRUCTURE SYSTEM PRESENTLY RELIES ON IT: PORTION OF STATE GASOLINE TAX AND LICENSE PLATE FEES FOR REVENUE TO MAINTAIN THE SYSTEM. EVEN WITH A RECENT INCREASE IN THE LICENSE PLATE FEE, WE STILL HAVE TO SELL BONDS IN AN ATTEMPT TO MATCH STATE AND FEDERAL REVENUES TO ACCOMPLISH MAJOR CONSTRUCTION FOR INFRASTRUCTURE PROJECTS.

I AM CONFIDENT THAT YOU CAN REALIZE THE VICIOUS CYCLE THAT SURFACES WITH RETIRING BONDS WITH THE HOPE THAT EVEN IF WE CAN SUPPORT OUR SHARE OF THESE MUCH NEEDED INFRASTRUCTURE PROJECTS, THAT FEDERAL REVENUE FUNDING IS READILY AVAILABLE. FOR THAT FUNDING TO BE READILY AVAILABLE, THE FEDERAL HIGHWAY TRUST FUND SHOULD STAND ALONE AND BE RELEASED FROM THE FEDERAL BUDGET. FEDERAL HIGHWAY FUNDING, IN PARTICULAR THESE AREAS WHERE WE, IN LOCAL GOVERNMENT, RELY MOST HEAVILY, MUST BE REAPPROPRIATED AT LEVELS WHICH WILL AT LEAST GIVE US THE SAME LEVELS OF PARTICIPATION. IT SHOULD BE USED FOR ONLY ONE PURPOSE, TO IMPROVE THE NATION'S TRANSPORTATION INFRASTRUCTURE.

ONCE AGAIN, I'M CONFIDENT THAT YOU CAN UNDERSTAND THE SEVERITY OF OUR SITUATION AND THE NEED FOR YOUR ADDITIONAL ASSISTANCE REGARDING THE MAHONING COUNTY INFRASTRUCTURE SYSTEM.

BRIDGE MANAGEMENT REPORT
7/2/90
FOR: MAHONING COUNTY

FOR NEXT 10 YEARS

TOTAL LOCAL MONEY NEEDED FOR NEXT 10 YEARS TO GET ALL

323 BRIDGES UP TO AN ACCEPTABLE LEVEL------------------------------ $22,000,000
(includes replacement, rehabilitation, and general
(maintenance)

MANY MAJOR STRUCTURES HAVE FEDERAL PARTICIPATION;

10 MAJOR SUPERSTRUCTURES NEED REPLACED

ANOTHER 10 NEED MAJOR REHABILITATION

25 SMALLER STRUCTURES NEED REPLACED

ANOTHER 25 NEED REHABILITATED

THE OTHER 250 NEED GENERAL MAINTENANCE

THE TOTAL COST (INCLUDING FEDERAL MONIES) NEEDED IN THE NEXT
10 YEARS -- $70,000,000

FOR 10 YEARS AND BEYOND

ESTIMATED ANNUAL MAINTENANCE COST FOR THE YEAR 2000 -------------- $ 1,000,000

ESTIMATED ANNUAL REPLACEMENT COST FOR THE YEAR 2000 -------------- $ 3,000,000

TOTAL COSTS NEEDED FOR THE YEAR 2000 ----------------------------- $ 4,000,000

ANNUAL COST FOR THE YEAR 2010 (THRU 2019) ------------------------ $ 8,000,000

ANNUAL COST FOR THE YEAR 2020 (THRU 2029) ------------------------ $16,000,000

ANNUAL COST FOR THE YEAR 2030 (THUR 2039) ------------------------ $32,000,000

DRAFT

HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
HEARING HELD ON JULY 16, 1990
OPERATING ENGINEER'S HALL
BOARDMAN, OHIO

STATEMENT OF JOHN R. GETCHEY, P.E.
EXECUTIVE DIRECTOR
EASTGATE DEVELOPMENT & TRANSPORTATION AGENCY
OHIO ONE BUILDING - SUITE 400
25 EAST BOARDMAN STREET
YOUNGSTOWN, OH
(216) 746-7601

The Eastgate Development and Transportation Agency (EDATA) is the Metropolitan Planning Organization for Mahoning and Trumbull Counties, Ohio, which includes the Youngstown-Warren Metropolitan Area. As such, we have been planning for transportation system improvements since the initial Comprehensive Transportation Study was prepared in the late 1960s.

The needs of the Youngstown-Warren region basically reflect the needs of other urban and suburban areas throughout the state and country. Our existing highway network is in need of repair. Ongoing maintenance costs have increased to a point where there is little, if any, local funding available for major reconstruction or new facilities. Growth is taking place in the suburban areas of the counties and not in the Central Business Districts. As a result, existing arterial highways and major collectors are quickly reaching capacity, as the rate of development exceeds the ability of political subdivisions to improve systems to handle increased capacity demand.

As the Metropolitan Planning Organization, EDATA annually prepares a Transportation Improvement Program (TIP) which lists all highway and bridge projects proposed for Federal Aid funding over a five-year period. The current TIP lists over $102 million worth of projects proposed for construction by State Fiscal Year 1995. A number of the listed projects have been programmed for a number of years, but have not moved forward. A primary cause of project delay is the inability of smaller communities to provide for the local share of the project cost. Federal funding is sought by these communities for the Preliminary Engineering phases of the projects, which delays projects one to two years. These smaller communities also must seek sources other than local funds to match Federal funds for project construction. Part of the problem is that the time required to implement Federal-Aid projects over the years and the complexity of these projects, have grown significantly--and continue to grow. As project implementation is delayed, costs continue to increase, congestion grows, and in many cases an important factor for the economic development of the area is delayed. The transportation process must be adjusted so that projects can be carried out as development occurs, or as system deficiencies are identified.

DRAFT

As the agency designated to administer the State Bond Issue 2 (Infrastructure Repair) program for Mahoning and Trumbull Counties, EDATA maintains a listing of all projects requested by communities in the two counties. In the last round of funding (December 1989), of 497 requested projects, 303 were roadway and bridge projects estimated to cost in excess of $127 million. Funding available through the program is limited to approximately $8 million per year. Again, the demand for project funding greatly exceeds the funding available.

The need for supplemental Federal funding programs to provide for on-going, annual maintenance is a need of most of the communities in the Valley. This funding would free up local money which could be used to leverage Federal funding for major improvements and new facilities. Local communities have, over the past few years, begun programs which are enabling them to use available local funding more efficiently. These programs include infrastructure inventories, pavement management programs, and an overall awareness of the importance of maintaining existing facilities by the use of comprehensive evaluations and good engineering judgement.

Local governments, aware of the costs associated with maintaining the existing infrastructure, have taken actions to increase the amounts of local funding available for highway maintenance and system reconstruction. The needs of the area have dictated that these efforts are necessary. Mahoning County residents approved a Bridge Bond levy which provided more than $23 million for bridge repair and replacement in the county. Since passage of the levy, over $12 million has been spent on 55 projects by the county and the City of Youngstown. The Mahoning County Commissioners have approved an additional $10 increase in the cost of vehicle registrations, which will be used for road repair. A number of other cities and townships have approved an additional $5 increase in vehicle registration fees for local roadway repair needs. With these additional sources of funding, the question continuously asked is, "Why aren't all our roadways and bridges in good condition?" The answer is simple. The needs of the area greatly outweigh available resources to meet those needs.

Some critics of development plans for the area have stated that transportation planning has, in the past, been done for non-economic development reasons, and has not kept up with economic development needs. Many highway system improvements which would assist economic development efforts have not been built due to lack of available funding. However, many of these improvements and new facilities have been identified, and have been promoted for the past 20 to 30 years. These projects are needed for economic development. They are priorities of the region, but they have not been fundable due to shortfalls at the Federal and State levels.

The Interstate Highway System is basically complete. Its purpose was to provide a direct link between cities through rural areas of the country. With its completion near, we must begin to concentrate our efforts in a number of areas. These include maintaining the Interstate System; providing for more access points on the existing system to better serve currently developing areas and areas proposed for development; to improving arterial and collector routes that lead to the Interstates; and building those new facilities which will accentuate the Interstate Routes. By providing these types of efforts, Central Business Areas such as those in the Youngstown-Warren Urban area, as well as fast growing suburban areas, will benefit.

The Youngstown-Warren area has long promoted its location and available transportation system. We are located mid-way between New York and Chicago, mid-way between Cleveland and Pittsburgh, and centrally located in the corridor between the Great Lakes and the Ohio River. The existing transportation system has been a major tool in bringing new industrial and commercial activities to the region. Interstate Route 80, the major east-west highway, carries approximately 40,000 vehicles per day through the region. The interchange of the Ohio Turnpike with Interstate 80, at Gate 15, is the busiest interchange on the Ohio Turnpike in terms of gate traffic. State Route 11, a four-lane limited access highway, connects Lake Erie with the Ohio River in East Liverpool. But with all these facilities, additional new construction is needed so as to promote economic development within the urban areas and central business districts.

In 1987, the Ohio Department of Transportation (ODOT) requested that communities in Mahoning and Trumbull Counties come together through EDATA and establish a list of those projects which would best benefit the region. That list of six major projects was submitted to ODOT in April of that year. Of the six projects, three have been activated and are in various stages of implementation. The top priority project, the SR711 Connector, was just recently activated by the State, and will be built with State and local funding. The two other activated projects, the US62 Relocation Project from SR225 to SR14 in southern Mahoning County, and the construction of an interchange at SR11 and King-Graves Road in Trumbull County will be built using Federal and State funds. All of these projects will be instrumental in development efforts in both counties.

During the past three months, we have been working with the local communities to update the 1987 Priority List. Three projects from that 1987 list which have not been implemented are still considered as the top priorities for future funding. The top priority project identified by communities in both counties is the long proposed Hubbard Expressway, which would connect the existing Youngstown beltway to IR80 north of the city of Hubbard. This connection would be instrumental in developing the east side of Youngstown, and would provide for improved access to the

Youngstown CBD. The project, with an estimated cost of $46 million, has been proposed since the mid 1950s. Other projects on the revised priority list are as follows:

2. Warren Outerbelt - Southern Leg From SR5 to SR82
   $68,000,000

3. US62 Relocation - US62 Salem to SR7
   $78,000,000

4. SR46 Widening - CH18 to Salt Springs Road
   $6,300,000

5. SR45 Widening - Mahoning Avenue in Warren from Summit Street to SR305
   $8,000,000

6. SR5 Widening - Warren Outerbelt to SR46 in Cortland
   $6,800,000

7. US224 Widening - SR616 in Poland to the Ohio/PA State Line
   $7,500,000

8. SR534 Widening - Newton Falls City Limits South to US224
   $18,000,000

These priority projects are necessary to promote economic development, to improve access to commercial ard industrial areas, and to improve current and anticipated traffic congestion problems.

The available Federal, State, and local funds needed to meet the current and future needs of our transportation systems will never be sufficient. For those who realize the amounts of funding needed, this is obvious. However, it is imperative that the Federal Government continue to support local needs. With the forthcoming reauthorization of the Federal Highway Act, a number of points must be made.

First of all, to offset some of the need for construction of major new highway systems, it is imperative that Federal funding support of local public transit systems be maintained. It is an absolute must that we secure maximum participation from the Federal Government if the full potential of public transit is to be realized in the years ahead. The Executive Director of the Western Reserve Transit Authority, James J. Ferraro, in a recent letter to our office offered the following.

> "For those of us dealing with transit first hand, our feelings are that there isn't a bigger threat to the quality of life in our communities than the continuing decline of mobility. Explosive growth in travel demand, inattention to transportation investment needs, the harmful consequences of

> land use and our insatiable appetite for automobile use are overwhelming our transportation systems and facilities. In turn, the increasing inability of the transportation provider to handle the efficient movement of people and goods undermines our regional economies, weakens our international economic competitiveness and dramatically diminishes the quality of our environment."

The second point that must be made is that Federal Transportation System funding programs must continue to be allocated for local project use by local officials. As a member of the Ohio Association of Regional Councils (OARC), the EDATA General Policy Board, by resolution, has supported the concept of a Metropolitan Transportation System which is based on formula funding and is administered locally through a cooperative process involving state and local governments and public transit operators. This process would include a formula program for continued reinvestment in the urban highway program, a formula program to support capital and operating needs of public transit, and a discretionary program targeted to major highway and transit capital needs based on a local decision-making process. Continued funding for Rural System Programs and Bridge Programs is also supported.

In conclusion, the infrastructure needs of our region are many. Highways and bridges are in need of maintenance and repair, and new facilities are required to improve existing traffic flow problems, promote economic development, and to prepare for anticipated growth. Continued Federal funding support of local highway, bridge, and public transit projects is an absolute necessity. Balances in the Highway Trust Fund should be reduced over a multi-year period by use on eligible transportation-related projects.

The consensus top priority highway project, currently not active or programmed, is the Hubbard Expressway. As noted earlier, this project will be a significant factor in determining the economic well-being of the region.

A MAHONING VALLEY FOR TODAY, TOMORROW AND THE FUTURE

It is often said that the Mahoning Valley is located in the most strategic area of the Northeastern part of Ohio and the United States. It is midway between Cleveland and Pittsburgh and midway between New York City and Chicago. It is the center of a 75 mile radius population of 7.5 million people.

Once dominated by basic steel, the Mahoning Valley continues to be a factor in that business area, but its industry has been diversified and it includes automobile assembly and parts manufacturing, metal fabrication of various kinds, and plastics. Mahoning Valley is fast becoming a service and distribution center. It is served by modern highways, notably the east-west Ohio Turnpike and Interstate 80, and the north-south Route 11 that connects the Ohio River to the South and Lake Erie, which lies 50 miles to the north of our area.

The community profile of the Mahoning Valley features modern, well-equipped and staffed health-care facilities; an outstanding urban university campus, visual and performing arts and cultural activities second to none; a treasure chest of community historical values; a progressive public and private educational school environment; a convenient and easily-accesible transportation network; a dedicated and highly-skilled labor force; a sincere and diversified ethnic and minority population; a park and recreation system featuring the sensational Mill Creek Park;...all in all,... Mahoning Valley is a great place and it needs and deserves tender loving care.

It was good news to hear the announcement that Federal Funds are being considered for the Hubbard Expressway connector to Interstate 80 in Hubbard; and the proposed improvement and ramping interchange connector at the Center Street Bridge with the City of Youngstown 680 Bypass. But,... the Mahoning Valley has felt a tremendous financial pinch with the loss of the Federal Reserve Sharing Program, especially in the Townships, Villages and Municipalities of Mahoning County. The State of Ohio has put their best foot forward with the passage of Issue 2 monies (H.B. 704). This provides for a state-local partnership to maintain and restore the essential service needs of our communities. It is designed to generate new investment in new and existing water, sewer, wastewater. road, bridge, and solid waste programs. These are essential needs for us to be absolutely concerned about inasmuch as they are of absolute necessity for growth.

In conclusion, ... it has also been said that prospective industries seek out the amenities of an area and evaluate and compare them to other prospective geographical site locations being considered for relocation. We strongly feel that we must continue to strive for infrastructure preservation and investment in order for us to preserve a competitive position in the competitive market of maintaining and attracting industry to Mahoning Valley.

The Board of Mahoning County Commissioners has demonstrated their positive approach for local funding with the various levies and taxation iniatives that have been implemented. These funds are available as matching funds for Federal and State Funding Programs that can be utilized for the Mahoning Valley. We are firmly convinced that we are a "diamond-in-the-ruff" geographical location,...but we need funding assistance and help to "polish-the-diamond" in order for it to "glitter" and attract economic and community development growth for the future of our youth in Mahoning Valley.

(Transportation and Public Works Committee)

Subject: U.S Department Of Housing And Urban Development
Low Income Housing Program

Mr. Chairman:

I am Warren Harrell, President of the Northeast Homeowners Association (NHA) which is an organization comprised of homeowners, who own real property on the eastside of Youngstown,Ohio. The organization was formed to protect the mutual interest and basic property rights of the homeowners on the east side of Youngstown, Ohio.

The east side of Youngstown,Ohio is a predominately black neighborhood highly impacted with public housing.

The Youngstown Metropolitan Housing Authority(YMHA) contrary to the intent of the U.S. Housing and Community Development Act of 1980, violated the act to avoid building the units in other parts of Youngstown Ohio, which are not racially impacted.

YMHA has build public housing on Woodside and Sunshine avenue, which will serve to further concentrate predominately black public housing in one area of the city of Youngstown, contrary to the intent of the Housing and Community Development Act,the Equal Protection Act of the United Stats Constitution, Public Housing Site and Neighborhood Standards.

In November and again in December 1989, we appeared in the United States District Court,Northern District of Ohio, Eastern Division, Judge David D. Dowd, Jr. presided at a hearing,which, we were seeking permanent injunction against YMHA to prevent them from building on their designated sites. Judge Dowd ruled that YMHA could build the units, based on the Youngstown Housing Assistant Plan(HAP) and the Northeast Homeowners Association (NHA) also had a right to pursue further court action as an organization.

Page 2 (NHA)

It is our opinion, that the HUD Low Income Housing Program must be more clearly defined, so that Regional Administators,Directors and local officials willbe more responsive and sensitive to the needs of the residents of the community.

We further believe, that the site selection process in its present form and as implemented by YMHA needs intensive monitoring by a federal auditing agency for compliance of their housing program.

In closing, let me emphasis that we are for Low Cost Housing because there is a dire need for housing, but they must be equally distributed throughout the metropolitan area.

We have documentation which was presented to the court to support our opposition to the YMHA and their housing program, which has been unfair to the citizens of this community.

Thank you for the opportunity to present our viewpoint and well known facts to this committee.

INFRASTRUCTURE NEEDS OF THE TOWNSHIPS OF MAHONING COUNTY
IMPORTANCE OF JOBS

As we consider the needs of Mahoning County and the Mahoning Valley we must keep health and safety issues a top priority. Infrastructure most certainly is of utmost importance.

With the loss of Federal Revenue Sharing, Townships felt a tremendous financial pinch and infrastructure was the top loser. The State of Ohio tried to help with this problem by passing Ohio H.B. 704 (Issue 2). This Bill provides for a state-local partnership to maintain and restore the essential service needs of our communities. The program is designed to generate new investment in existing water, sewer, wastewater, road, bridge, and solid waste projects and to have that new investment available to every governmental unit which has a need for assistance.

Although we have good cooperation between the Townships, County, Village, and City Governments in Mahoning County, the needs cannot possibly be met by this State Program. Ohio has done much to help its own communities, but most certainly more funding from the Federal Government for infrastructure is essential.

Another top priority must be the jobs that affect our very existence; especially that of our youth. If we don't provide job opportunities for our young people they will leave our area and take with them their knowledge and work skills. Approximately 70% of property tax monies go for the education of our youth. This is a huge investment and we should spend more to create employment opportunities that will keep citizens in the Townships, Villages, and Cities of the Mahoning Valley. Infrastructure and jobs walk hand-in-hand.

We can, and must, have preservation of existing jobs and infrastructure at the same time we are expanding into new areas of both. Federal and Local Governments must work as a partnership to maintain and restore the services that are necessary for business to invest in the Mahoning Valley.

Statement by Ohio State Representative

SEAN D. LOGAN

Before the U.S. House Committee on Public Works and Transportation
The Honorable Glenn M. Anderson, Chairman
Monday, July 16, 1990

I would like to thank Chairman Anderson, Congressman Traficant and the rest of the committee for the opportunity to speak here today. I would like to speak briefly in support of this committee's efforts to improve the area's infrastructure, including the proposed expansion and improvement of Ohio State Route 14 and United State Route 62.

In my district, Columbiana County, as in most areas of Ohio, job creation remains our highest priority. Its importance cannot be over-emphasized. Our unemployment rate still lags behind both national and state averages, as does our rate of business start-ups. While we have made progress in the last decade, too many of our people are still unemployed and underemployed. Our ability to attract and hold the jobs of the future will rest, in large part, on our ability to provide business with a quality infrastructure.

Without a sound infrastructure; without access to sound utility service, good roads and highways, good water, and modern waste disposal facilities, no strategy for business development can be fully successful. I encourage and support any action that this committee can take toward achieving these ends.

In this part of the state, we often take for granted our proximity to the the Ohio River and its tributaries. Sometimes we do not fully appreciate the value of our water resource, nor do we often enough appreciate the importance that industry places on the availability of clean, plentiful water.

Many businesses that we lost to the so-called Sunbelt 15 and 20 years ago are now looking at the Midwest with new eyes. The very attributes that once put us at the center of America's industrial heartland are once again attracting the attention of business. I want to be sure that, when business looks to the Midwest, we in Eastern Ohio are ready.

Thank you.

Presented by Charles Miller

INFRASTRUCTURE NEEDS
TRUMBULL COUNTY

AS PREPARED FOR THE JULY 16, 1990
"COMMITTEE ON PUBLIC WORKS INFRASTRUCTURE HEARING"

In my capacity as the Trumbull County Sanitary Engineer, I am acutely aware of the Public Works Infrastructure Needs of Trumbull County in the form of water and sewer improvements and the impact of these needs on jobs in the area.

The grants program for wastewater improvements as administered by the U.S. and Ohio E.P.A. through 1988 enabled larger communities and more densely populated areas to construct new, and upgrade existing wastewater treatment plants, interceptor and collector sewers. I find, however, that many small communities and suburban areas with pollution problems and real needs for new or upgraded wastewater systems were unable to be funded due to competition for grant dollars. These needs still exist and are growing more acute each day. The current loan program which was intended to replace the grants does not, in my opinion, provide enough assistance to the small communities to make these wastewater improvements "affordable". Lack of these improvements has essentially prevented any commercial or industrial growth in these areas, resulting in a negative impact on the creation of new jobs. It has also left Trumbull County with many areas with failed or inadequate "on-site" treatment systems, resulting in the pollution of ditches, streams and water wells.

Enclosed you will find Table I which lists examples of wastewater improvement projects which have been prioritized in descending order.

Trumbull County also has many areas which are in dire need of Public Water Supplies. In most of these areas, water improvements are considered "unaffordable" due to geographics and location, population density and/or the high cost of purchase of water from the supplier, or need to construct new sources of water and treatment facilities. Lack of Public Water Supplies has also negatively impacted the commercial and industrial development of these areas and the corresponding creation of new jobs.

Enclosed on Table II you will find a list of examples of areas which currently have a need for public water improvements.

We have seen that in areas where we have been successful in securing outside dollars to assist in constructing these water and sewer facilities, a mix of commercial and diversified industrial development has occurred.

I therefore urge the members of Congress to consider as a high priority the creation of additional programs to provide financial assistance for the construction of water and wastewater facilities in areas where the need exists and where it is currently not affordable.

EXAMPLES OF WASTEWATER IMPROVEMENT PROJECT NEEDS
TRUMBULL COUNTY

PROJECT	LOCATION	ESTIMATED COST	COMMENTS
Kings-Graves Interceptor Sewer	Howland & Vienna Twps.	$1,250,000	Needed to eliminate obsolete, undersized treatment plant to allow additional commercial and industrial development.
McKinley Heights Interceptor & Collector Sewer	Niles, Weathersfield Twp. and Vienna Twp.	$1,500,000	Needed to alleviate existing pollution and allow commercial and industrial growth.
Kinsman Sewer Improvement	Kinsman Twp.	$2,000,000	Needed to alleviate existing pollution and allow for commercial and industrial growth.
Bazetta N.W. Interceptor and Collector Sewers	Bazetta Twp.	$2,000,000	Needed to eliminate existing pollution to a water supply and allow Dept. of Natural Resources to improve recreation facilities and commercial growth.
Evansville-Hilltop Collector Sewer	Weathersfield Twp.	$3,700,000	Needed to eliminate existing pollution.
Logan Avenue Interceptor Sewer	Liberty Twp. and Youngstown	$2,000,000	Eliminate obsolete and undersized pump station and allow for commercial and industrial development.
Newton Sewer Dist. #1 Collector	Newton Twp.	$1,200,000	Eliminate existing pollution upstream of a water treatment plant.
Bazetta S.W. Interceptor	Bazetta Twp.	$ 500,000	Needed to eliminate existing pollution and allow for commercial, industrial and residential development.
Golden Triangle Interceptor	Howland and Champion Twps.	$3,000,000	Eliminate individual treatment units and provide for commercial and industrial growth.

TABLE II

EXAMPLES OF WATER IMPROVEMENT PROJECT NEEDS

PROJECT	LOCATION	ESTIMATED COST	COMMENTS
Eastern County Water System	Howland Twp.	$5,500,000	Needed to eliminate failing private wells and allow commercial and residential development.
Liberty Township Water Improvements	Liberty Twp.	$ 750,000	Needed to correct pressure and supply problems, and permit commercial development.
Kinsman Water System	Kinsman Twp.	$1,500,000	Needed to provide potable water supply for existing commercial and residential, and permit commercial growth.
Howland-Niles Water Tank	Niles and Howland Twp.	$ 750,000	Needed to allow commercial and residential growth.
Brookfield Booster Pump Station	Brookfield & Hubbard Twps.	$ 55,000	Needed to allow expansion of water system, thus stimulating commercial growth.
Warren Twp. Water System Meadowbrook Heights	Warren Twp.	$ 500,000	Needed to eliminate failing and poor quality water wells.
Brookfield Elevated Storage Tank	Brookfield & Hubbard Twps.	$ 750,000	Needed to replace deteriorated storage tank and allow expansion of the system.

Congressman Glen Anderson - Chairman

Dear Members & Staff:

I am Martin J. O'Connell, President of the Greater Youngstown AFL-CIO. I would like to convey my appreciation to you as well as to Congressman Traficant for conveneing this hearing in the Mahoning Valley.

Needless to say, communities such as ours, very old and with a high rate of unemployment, face a dire and extremely urgent need to recognize their decaying infrastructure. Our community is one in which local taxpayers funded many projects through out the United States with their tax dollars and received very little rate of return for the use of their hard earned funds.

Full well relizing that the local governments in the Mahoning Valley must learn to operate as a regional group and must learn that what is:

A) Good for Mahoning County is good for Trumbull County.
B) Good for Warren is good for Youngstown.
C) Good for Austintown Township is good for Liberty Township.
D) Good for Levittsburg is good for Lowellville.

I am conveying to you the following list of projects that I personally feel will help the residents of the Mahoning Valley obtain and retain the industries to bring full employment with decent wages to all of its citizens.

1) The 7-11 Connector is needed to link both Communities.
    a) 17,000 Residents of Trumbull County work in Mahoning County.
    b) 21,000 Residents of Mahoning County work in Trumbull County.
2) Kings Graves Road Interchange must be completed as soon as possible.
    a) The viability of the Airport for Industrial development is dependent on this project.

3) The Freeway System must be tied into the old Steel Mill properties on the East side of Youngstown and the Struthers-Campbell area.
   a) This land, though vacant, has no freeway access or very limited, thus prohibiting development.
4) Deteriorated conditions and immediate need of renovation to Bridge System is very obvious.
5) Water System-lead lines and some wood lines need to be changed. Much of the system is undersized and money is not available to renovate or extend the system to expediate developement. Meander Water Treatment Plant needs approximately a 160 million dollar renovation. Neither Youngstown or Niles can afford this without the help of Federal Dollars.
6) Sewer System is inadequate now, with no monies for updating or expansion.
7) City Steam System is in constant need of repair as evidenced by steam leaks which cause tremendous inconvenience to the transportation system.

In conclusion Chairman Anderson, while commending your committee for its recognition and obvious concern of the infrastructure problems facing all communities, I am respectfully requesting that you place communities such as ours - old with a depleated tax base - as high as possible on any priority list that may be established for Federal Funding.

Respectfully submitted by,

Martin J. O'Connell
Presient

HOUSING PROBLEMS

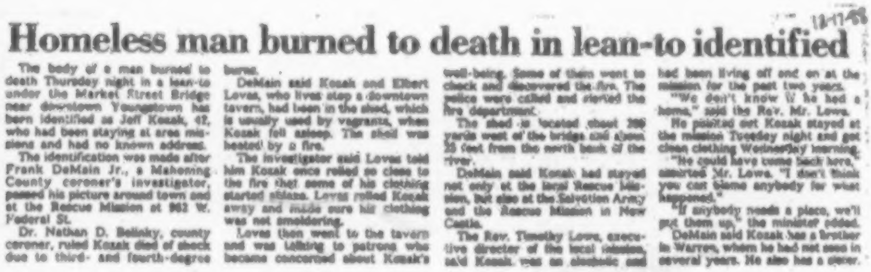
Take welfare payments that are too low, add unemployment and underemployment and inadequate or lack of housing becomes a cold hard fact. The housing problem transcends age and race.

IT IS A SOCIAL PROBLEM - Maslow stated there was a hierarchy of needs and that before we can be enriched and happy, we must have our concrete needs met ----- food-water-housing. You can't counsel someone about work or education if they are hungry and have no place to live. Inadequate housing effects everyone; the person who never worked, teachers, waitresses, mothers with young children, people on Social Security, the unemployed, college professors and it also effects you and I.



12-17-88

Homeless man burned to death in lean-to identified

The body of a man burned to death Thursday night in a lean-to under the Market Street Bridge near downtown Youngstown has been identified as Jeff Kozak, 42, who had been staying at area missions and had no known address.

The identification was made after Frank DeMain Jr., a Mahoning County coroner's investigator, passed his picture around town and at the Rescue Mission at 962 W. Federal St.

Dr. Nathan D. Belinky, county coroner, ruled Kozak died of shock due to third- and fourth-degree burns.

DeMain said Kozak and Elbert Lovas, who lives atop a downtown tavern, had been in the shed, which is usually used by vagrants, when Kozak fell asleep. The shed was heated by a fire.

The investigator said Lovas told him Kozak once rolled so close to the fire that some of his clothing started ablaze. Lovas rolled Kozak away and made sure his clothing was not smoldering.

Lovas then went to the tavern and was talking to patrons who became concerned about Kozak's well-being. Some of them went to check and discovered the fire. The police were called and alerted the fire department.

The shed is located about 200 yards west of the bridge and about 25 feet from the north bank of the river.

DeMain said Kozak had stayed not only at the local Rescue Mission, but also at the Salvation Army and the Rescue Mission in New Castle.

The Rev. Timothy Lowe, executive director of the local mission, said Kozak was an alcoholic and had been living off and on at the mission for the past two years.

"We don't know if he had a home," said the Rev. Mr. Lowe.

He pointed out Kozak stayed at the mission Tuesday night and got clean clothing Wednesday morning.

"He could have come back here," asserted Mr. Lowe. "I don't think you can blame anybody for what happened."

"If anybody needs a place, we'll put them up," the minister added.

DeMain said Kozak has a brother in Warren, whom he had not seen in several years. He also has a sister.

IT IS A HEALTH PROBLEM:

A) *I have clients who have had heart attacks and were prescribed hydrodural patches. The client cut the patches in half and used them two days instead of one to save money. I had a lady last week, who quit taking her heart medication because she couldn't afford it. There are people who were over income for Medicaid but did not earn enough to pay their housing costs and medicine - they had to set priorities.*

We have a newspaper article showing the effects [illegible] had on one woman. It tears your heart to see these people struggle. And yes, some are in a finaicial mess through their own fault - but the people I see most of the time are doing the best they can with the money they have.

B) There are many types of homeless people. Some could be kept off the streets by building more shelters but it is not the answer. It won't help the mentally ill who are deinstitutionalized from our state mental institutions. They need care to live and function on a daily basis. Some are happier on the streets. There are homeless people I've placed in decent housing several times and they are back on the streets where they want to be. They probably do not and would not want permanent housing. Should we force them to accept our help?

C) The Youngstown Warren Area ranks 51st nationwide in numbers of children and women of child bearing age who live in pre 1950 housing. This exposes them to more lead based paint and the dust as it deteriorates. 12-16% of the pregnant women have lead levels above 10 which placed these babies at risk for decreased gestational age, low birth weight and problems with neurological development.

Picture of kitchen in poor household, where priorities had to set for health care rather than housing.

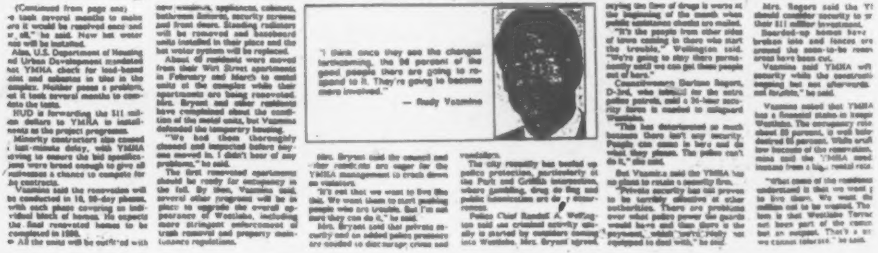
IT IS A FAMILY PROBLEM:

People all over the United States are ***"doubling up"*** *because of lack of housing. They are living with family and friends and sometimes people they hardly know or in shelters in their desperate need to survive. This causes stress in the family relationship and stress on the families themselves. Overcrowded conditions have a negative impact on family life.*

Diedra Locke, 26, and two of her children, Deandre, 8, l and Delaiondria, 7, aren't leaving their condemned, unheat apartment at 3147 Prospect Ave. because Locke is afraid building will be looted if it's left vacant. Some 20 adults a 20 children are living in the four-story, 44-unit building, wh residents say has been without heat since Thanksgiving.

****

YMHA hopes $11 million Westlake renovation will reverse decay



(Continued from page one)

IT IS AN ECONOMIC PROBLEM:

For the People:

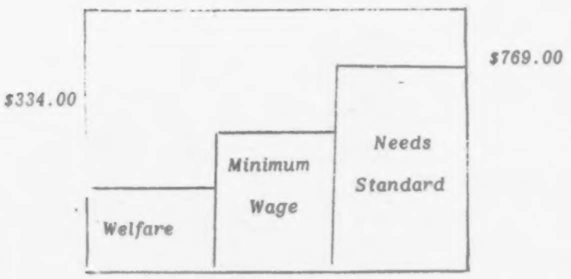
As I walk around our city, I see empty spaces where homes once stood. I wonder, where did the people go? We have people coming to the agency who live in cars and wonder if they can receive food stamps since they have no kitchen. They need milk for a baby and a tank of gas. When I ask, "Why do you come to Youngstown," they answer there is no help down South. There are more agencies who are willing to help here and the people are coming to get that help. As noted in the statistics, many of our homeless come from other counties or states.

A typical budget for a family of three:

$250.00	*Rent (includes water & gas)*
45.00	*Electric*
21.00	*Telephone*
13.00	*Soap & paper products not purchase by food stamps*
$329.00	

(No newspaper - car - gas)

$334.00	*Welfare payment*
-329.00	*Payment for bills*
5.00	*Balance*



GRAPH OF MONEY AVAILABLE

'It's not a pretty place to live'

Renovation set to begin at Westlake

By Tim Roberts
Vindicator staff writer

The long-delayed $11 million renovation of Westlake Terrace Homes has finally been set to begin in July, giving Youngstown Metropolitan Housing Authority officials and Westlake tenants hope that the declining standard of living at the run-down housing project can be reversed.

Years of neglect have turned one of the country's oldest housing projects into a deteriorating slum. Ironically, Westlake was built 48 years ago as an alternative housing to the squalid tenements and shanties of the "Monkeys Nest" neighborhood on the south side of West Federal between Westlake Crossing and Worthington Street.

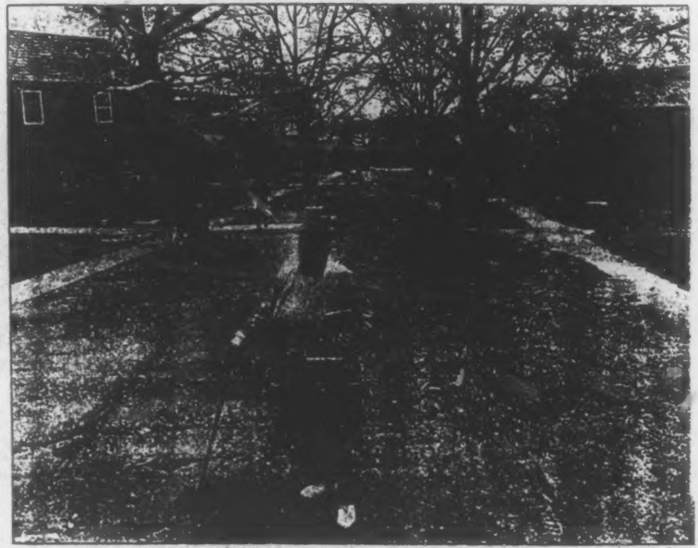
When completed in 1940, the 600-unit complex on the north side of West Federal was hailed as the solution to the growing problem of housing the poor.

"The greatest benefits are expected to be indirect, through improvement of areas which now breed crime, disease, dependency, delinquency," a Vindicator editorial said at the time.

Westlake has come full circle. The startling physical deterioration assaults the senses.

Broken glass litters the yards and sidewalks while graffiti taints the faded brick buildings. Vacant apartments are broken into and used as makeshift garbage dumps. Trash overfills the regulation garbage bins. The stench from the garbage is overwhelming.

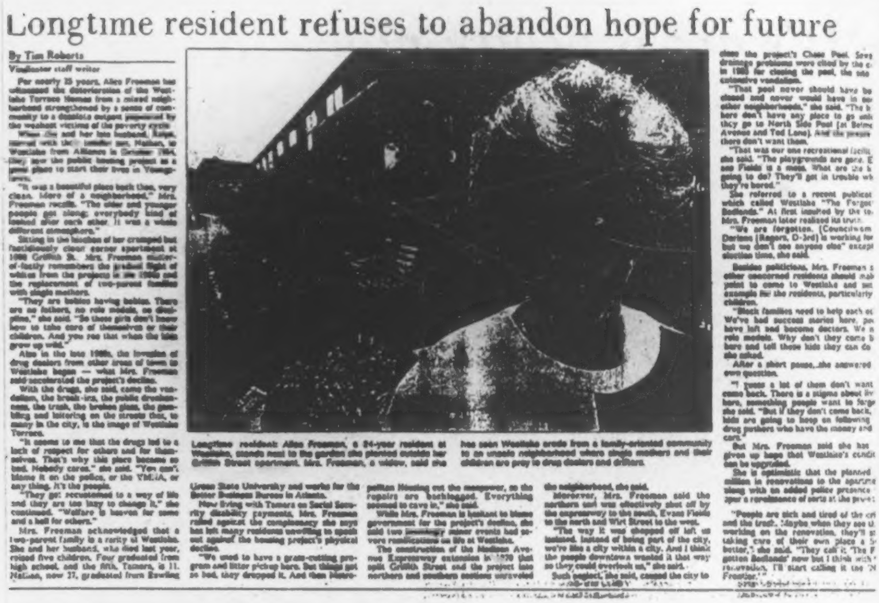
The emotional malaise of the residents also is easily seen. A walk along Griffith Street on a



The Vindicator / Bob DeMay

Woebegone Westlake: Mabel Bryant, Westlake Terrace Tenants' Council president, makes her way along a muddy stretch of land separating apartment complexes in Westlake Terrace's Griffith-Wirt streets section. Residents had complained that cars roared through the stretch that once had been grass covered. A chain link fence has been installed where Ms. Bryant is standing to cordon off apartments on the right. Those units will be some of the first to undergo extensive renovations.

BEFORE REHABILITATION



Longtime resident refuses to abandon hope for future

By Tim Roberts

Vindicator staff writer

As I walk through the projects, I see grafitti on the building the absence of grass in the yards and broken bottles scattered in the streets and I ask myself, "Would I want my family or my grandchildren to live here?"

We need to monitor subsidized housing as they did 25 years ago. I believe it costs less to pay one person to monitor the conditions than to rehabilitate the apartments. (They used to have a person visit each apartment on a regular basis and check the total apartment. Tenants were not allowed to hang clothes, etc., on the banisters and collecting junk or clutter was not allowed. Extra people were not allowed to move in).

Also, I feel tenants whose rent is less than the amount allowed by Section 8 should not be given the difference in cash. This money can be used to help more people.

HOPE

Some effort is taking place. Our agency is a part of the HOPE Program - Home Ownership Protective Effort. We work to assist people whose homes are in danger of foreclosure and are FHA guaranteed loans.

Take, for example, the Green Family. Mr. and Mrs. Green are in their 40's. They have three children. Mr. was employed by his company for 16 years during which time the couple purchased a home. Things were going well until Mr. Green was laid off. His temporary layoff became permanent. He exhausted his unemployment benefits. Reluctantly, they entered the Welfare System. Mrs. obtained part-time employment until she began to experience kidney problems. Mr. had a heart attack and recoverd sufficiently to continue his search for employment. He finally was hired at his original place of employment and he is happy to be there. However, he was seperated from the company over a year and had to start over as a new employee at a wage much lower than he had earned previously. I realized they were new to the helping system. I referred them to Salvation Army for assistance with their electric bill to avoid a disconnection and to the Welfare Department for help with their gas and water bill. I counseled them regarding generic medication to enable them to save on medical costs and assisted them with a food order. I, then worked out a payment schedule with their mortgage company which would enable the family to stay in their home. I worked out a budget with the family and suggested counseling if they continued to feel stress. They are eligible for free counseling because of their income.

It's difficult for people who have worked all of their lives and raised their family and lived independently to walk into an office and bring their economic problems and bear their lives to you. Most of the families I see are experiencing problems through no fault of their own. Our HOPE clients are all ages, some 60 years of age and some in their 20's, they live in Youngstown, Boardman, Canfield and in every part of our county. They are black and they are white and Hispanic.

On the positive side, Mahoning county has agencies willing to assist with food and cltohing and some utilities. However, there is too great a description between the Welfare and minimum wage and the needs standard.

Unemployment is bad! But you're still affiliated with the company and probably receive some benefits. Underemployment is terrible! When we have two parents working for minimum wage at fast food chains while juggling children and receiving no health insurance, is it any wonder why Welfare looks so good to them? The Healthy Start Program and it's free prenatal and infant care is a good beginning, as is WIC and Day Care. Once the families move into-the Welfare System, they're scared of losing the medical, stating they are afraid they'll get sick. And the cycle begins.

FOR THE GOVERNMENT *- And everyone*

The government is already spending billions on housing - in it's efforts. Let's go a step further - let's double the numbers of our subsidized housing and monitor their care and use. If we don't, we're all going to pay more in social services and the judicial system.

The housing problem is an imeptus which gives other social problems a start - like an incubator which helps them grow.

The statistics are staggering, the money necessary is astronomical but remember no matter what numbers you believe are correct, these are people - and as long as our citizens are without adequate housing, our job is not complete.

HOMELESSNESS SURVEY FACT SHEET

- * The survey was conducted by 20 agencies and organizations from November 14, 1988 through December 13, 1988.
- * The survey results establish a minimum number of persons experiencing homelessness; the survey does not attempt to count all of the homeless individuals in the Youngstown area.
- * 389 people indicated on behalf of themselves and/or their family, that they had been homeless within the preceding year.
- * The survey respondents represent 609 homeless people: 313 adults and 269 children under 18.
- * Of the 269 homeless children, 127 were 5 years old and under, 197 were 10 and under.
- * 108 respondents were single males; 99 were single females.
- * 115 respondents were single women with children; 4 were single men with children; 14 were couples with children.
- * 33% of those stating the duration of their homelessness were homeless for less than one week.
- * 46% of those stating the duration of their homelessness were homeless for two weeks or less.
- * 63% of those stating the duration of their homelessness were homeless for one month or less.
- * 24% of those stating the duration of their homelessness had been homeless for more than two months; 9% had been homeless for more than a year.
- * Only 33% of the respondents stayed in a shelter.
- * 17 individuals and families resorted to living in an abandoned building.
- * 222 individuals and families chose to "double up" with family or friends.
- * 6 single men and one woman lived in a car or truck while they were homeless.
- * 25% of those responding indicated that they had worked in the last twelve months.
- * Factors cited as cause of homelessness:

30.3% - Inadequate income for rent or utilities
18.6% - Domestic Violence
12 % - Loss of Job
11 % - Housing Uninhabitable
10.6% - Family/marital conflicts
8.6% - Eviction
6.6% - Fire
6.6% - Substance Abuse
4.1% - Mental Illness

The Jack and Justine Wheeler family in front of their home.

For the Jack Wheeler family, the bad news came in the winter of 1981. After spending 16 years as an electrician, Jack was told he would be laid off indefinitely — and possibly permanently.

Two years went by and still there was no hope of his being rehired. Jack's unemployment benefits were exhausted. His wife Justine's job just wasn't bringing in enough to make ends meet for them and their three children. And his occasional success at finding part-time employment wasn't enough either.

As a result, the Wheelers were on the verge of losing their home. They were three months behind in their $475-a-month mortgage payments and received a foreclosure notice from the bank. They had already depleted their savings and sold one car to meet their obligations.

That's when the Wheelers really needed **HOPE.**

HOPE stands for Home Ownership Protective Effort, a non-profit program designed to help unemployed persons and their families who are having trouble meeting mortgage and utility payments and who risk foreclosure or interruptions of service.

At no charge to client families, **HOPE**'s trained counselors help analyze and evaluate their financial situation. Together they devise a payment plan that will use the family's resources most effectively. In the case of severe and immediate financial need, **HOPE** can also supply families with food from their own or an area food bank.

Counselors help the client families learn how to budget, meet mortgage payments, pay the utilities and get back to work, staying with the families until they are self-sufficient. Often, that means providing employment counseling, as well.

Most referrals of families in need come from lending institutions, utilities, private mortgage insurers, mortgage investors and the Federal Housing Authority (FHA), who vest negotiating powers in **HOPE** rather than go through a costly foreclosure or collection process.

The principal sources of **HOPE**'s revenue are these same lending institutions and utilities, who agree that it is only right that they, who benefit from **HOPE**'s services, too, should share the cost of the professional counseling.

The Wheelers admire the home they almost lost.

The **HOPE** program, administered by Housing Opportunities, Inc., a non-profit corporation with headquarters in McKeesport, PA, has been helping people keep their homes — and their pride — since 1983.

[illegible]

After helping Jack and Justine Wheeler review their situation, the **HOPE** counselor immediately requested a loan from Housing Opportunities' Revolving Loan Fund to bring the Wheelers up to date on their mortgage and stop the foreclosure proceedings.

The loan was approved and a repayment schedule, which would not begin until the Wheelers were back on their feet, was worked out. The family received some badly needed food from the Housing Opportunities food bank, and at Christmas, Housing Opportunities was able to supply the three Wheeler children with gifts.

Soon after, the Wheelers enjoyed a stroke of good luck. Jack was hired as a full-time electrician by one of his part-time employers and the Wheelers were able to pay their mortgage and utility bills in full, plus $55 a month on their Housing Opportunities loan. Once again, the family could feel secure in their home and look at their future without fear.

[illegible]ing problem

More and more families have experienced the Wheelers' plight. Unemployment figures have remained high, and of those few who have been re-employed, many were forced to take much lower paying jobs in a new field. Most unemployed workers aren't as lucky as Jack Wheeler, who found a new job relatively soon in the field where he'd spent his whole working life.

But there is **HOPE**. Besides supplying delinquent mortgage counseling and acting as a liaison with lenders and utilities, **HOPE** stays with a family until they're really on their feet and self-sufficient. In most cases, it's a matter of months; for some, it may take years.

Once budgeting skills are taught and client families have set priorities for spending, it often becomes clear that their income isn't enough to cover their obligations. So the **HOPE** counselor contacts creditors, negotiates payment arrangements, and may advise families to sell unnecessary possessions in an effort to increase income.

Of course, the best way to do that is to find employment. All family members are encouraged to find jobs, and many families are able to keep their homes because spouses of unemployed workers have found part-time employment.

While encouraging these short-term solutions, the **HOPE** counselor also addresses the long-term problem: workers who probably will not be recalled to their jobs. A counselor may direct unemployed clients to the testing resources of local educational institutions and help them enroll in academic and vocational training programs to increase their prospects for self-sufficiency.

In many cases, mortgagors are referred to government programs they might be eligible for — some clients receive federally sponsored fuel grants and food stamps — and referrals are made to state public assistance and medical assistance programs. Clients are also directed to the resources of private community organizations, including mortgage assistance programs, home repair assistance offered by churches, lodges, social clubs and community food banks.

When necessary, family members are referred to agencies for help with emotional, marital or family problems created by the stress associated with long-term unemployment.

ar
OPE

For most Americans, the massive job lay-offs of the early 1980s were simply the stuff of newspaper and magazine articles, radio and television newscasts.

But in many areas across America, the recession hit home especially hard for workers who had expected to spend their working lives with one company, only to find themselves laid off in groups of thousands, month after month.

They were the major casualties of America's economic slowdown. Once comfortably enjoying the American dream, they were suddenly faced not only with the loss of their jobs but also with the loss of their homes.

HOPE found a way to enlist the help of those in the best position to ease the burden on their neighbors — corporations, lending institutions, private mortgage insurers, the FHA, mortgage investors and utility companies.

It is they who have helped **HOPE** become a financially viable program by underwriting the costs of counseling and showing true patience and understanding for the families they

for you
kindne

Hundreds of families have written letters in appreciation of HOPE.

serve. They feel that it is only right that they, who benefit directly from **HOPE**'s services, by avoiding potential defaults and losses, should share the cost of providing those services.

HOPE, then, is not a charity but a viable business proposition born out of a strong sense of community and compassion. With that kind of foundation, it should be no surprise that **HOPE** continues to grow.

HOPE has achieved a large measure of self-sufficiency.

Today a great percentage of its income is derived from earnings from the corporations, lending institutions and utilities who pay **HOPE**'s counseling costs.

However, there's still a large need. In fact, all the financial aid to client families comes from contributions from various "resource wells" in the community — corporations, schools, churches, small businesses, civic and social clubs, college fraternities and sororities, professional associations, and individuals.

To enlist their support, **HOPE** has created the **Adopt-A-Family Program** whereby groups and individuals can contribute funds on a monthly basis to meet the financial needs of a particular family in their area, until the family is once again self-sufficient.

The Adopt-A-Family Program usually lasts about 12 months — or as long as **HOPE** is working with the family. A family's financial need averages between $100 and $500 a month and continues until the counselor is confident that a family can maintain itself without further assistance from **HOPE**. Adopt-A-Family funds are used to cover the costs of mortgage payments, utilities, food and job training.

The program provides donors with the unique satisfaction that comes from helping their neighbors and from the rewarding knowledge that the basic unit of society — the family — is being prepared to renew its own contribution to the community.

It's difficult to live side-by-side with families in need without wanting to help. So if you — or any organization of which you are a part — would like to form a "resource well," please contact the **HOPE** office nearest you (addresses listed on back of brochure), and help **HOPE** keep finding a way.

Home Ownership Protective Effort...Good Business!

Pittsburgh National Bank has been a long time participant in the public/private partnerships established by Housing Opportunities, Inc. Pittsburgh National Bank is an active participant and supporter of the Home Ownership Protective Effort (HOPE) and the Earned Home Ownership Program (EHOP).

Roberta Bagnato is Manager of Centralized Collections and Vice President of Pittsburgh National Bank, Community Banking Division. A business administration graduate of the University of Vermont, she joined PNB and progressed through a variety of management positions to her present responsibilities. Among her many activities, she serves as an instructor in Real Estate Finance and Creative Collections for the American Institute of Banking.

Pittsburgh National Bank Vice President Roberta Bagnato.

A long time supporter and advisor to the Home Ownership Protective Effort, Roberta was honored in 1987 as HOPE Volunteer of the Year. She was recently interviewed by **Opportunities Knock**.

Is HOPE good business?

Roberta Bagnato: One of the problems that we bankers run into is consumer difficulties with their payment. And when they result in delinquency in their home mortgage, it is even of a greater concern.

Our expertise is in lending money, having it get paid back in a timely fashion; thus, earning a profit for our company, our shareholders. That is good business.

So anything that helps us to have loans paid on a current basis is also good business.

When real-estate, first-mortgage debtors, especially residential debtors, have some reason why they cannot make their mortgage payments on time, we are obviously not earning income from that asset. That debtor is then in a precarious position, as are we. Because the debtor is protected under laws which serve all consumers well, we cannot readily foreclose, pay off the debt and be done with it.

We really don't want to have our homeowner customers on the street looking for other ways to house themselves. That is also not good business. And it's not good for the community. HOPE comes to us and gives us a way to help the customer help themselves, which helps us.

The customer is delinquent; the customer is overextended and for whatever reason has had serious financial difficulties whether that be unemployment, underemployment, illness, death in the family, divorce; they are looking for alternatives. We are not good counselors in that regard because we cannot be an advocate for the consumer.

The HOPE program steps into this situation and says:

> *We'll take a look at it. We'll see what we can do with the consumer debtor to have them be able to pay you current and, if not, we'll tell you that too.*

The HOPE counselors are extremely well-schooled, well-versed: they know what is available to that customer debtor, whether it be food banks, revolving loans, job assistance, or energy assistance. They help them see whether they can afford to make that payment and help them with their budgeting. In most cases, the HOPE counselors are able to work with that debtor to allow for current payments within a certain period of time. We get our loan back on its normal course. We are then again making the money we need to make, a return on that asset. It's now an earning asset again. We are happy; the customer is happy; HOPE has helped us.

Does HOPE always succeed?

Bagnato: Let's say that for whatever reason, serious unemployment, serious underemployment, serious reduction in income caused by divorce, a customer can't get those payments current. HOPE works with the debtor to show it is in their best interest to sell the house, and work with them on alternative housing. The customer sells the house; our asset is paid. We lend the money again. Obviously, in our best interest.

In one out of ten cases, when the customer can't be helped, we'll still say "It's good business" because we have done everything in our power. And we know our foreclosure action will go forward much more smoothly than if we had done none of that.

Continued on page 2

Continued from page 1

We understand that internally at Pittsburgh National Bank there is a procedure — that before you go to foreclosure you make a referral to HOPE.

Bagnato: Basically, in all the portfolios we have a policy in place that when a consumer debtor tells us, for whatever reason, "I'm having trouble paying my bills. I can't do this. I can't do that," we automatically ask the customer if they will allow a HOPE counselor to work with them to see if there is a way to resolve the delinquency and save the house.

Tell us from a business person's perspective, are those referrals for HOPE, where you are paying the counseling fee, cost effective?

Bagnato: It is much more cost effective than foreclosure, attorney fees and the loss that we entail on every single home that we would eventually have to take to foreclosure.

In your relationship with Housing Opportunities and working with the counselors, and your staff working with our staff, are there any negatives? Are there any difficult areas?

Bagnato: The only difficult areas I see are two. And the first is that, unfortunately, not every consumer can be helped. I would personally like to see them all be helped, because that's good business. I don't have to foreclose. I don't have to lose money on the sale of a piece of real estate that I really didn't want to take in the first place.

The second thing is much more individualized. And that is that it seems at times that Project HOPE doesn't have enough support. There aren't enough alternatives for the consumer debtor. There could be more opportunity for — additional food bank, additional job assistance programs — more resources.

And I think that the job of Housing Opportunities then is to make sure that all the lending institutions in the greater Pittsburgh area understand the cost-beneficial approach and the cost benefits that we've enjoyed by having the relationship with Project HOPE.

That would certainly help them get more income to probably do an even better job.

The marketplace and employment profile for an industrial area like Pittsburgh is certainly improving... Is there still a need?

Bagnato: There is still a need. There are always going to be unemployment and underemployment situations, maybe not as many now as we have had over the last three years. But there is always going to be divorce. There is always going to be unemployment from other reasons, either corporate restructurings: where we have seen a lot less unemployment on the blue collar side, we're seeing more of it on the while collar side from some of the major corporate headquarters leaving Pittsburgh.

There are always going to be some difficulties. Overextension today is a major concern because the proliferation of unsecured credit has helped some homeowners to get "topsy turvy" with what's important: you know, pay the unsecured, pay the secured. So, HOPE has a place in all those situations.

Anything else?

Bagnato: I would just like to reiterate that we have enjoyed our experience with HOPE. We find the program to be very cost effective. And it's been good business for us. The number of foreclosures has been reduced. And that means less loss, more income coming in, earning assets. And that translates into earnings for the corporation. And I would just like to thank HOPE for being there when it was needed to help us in that endeavor.

We hear you saying that there is a nice fit between the bank's business goals and its civic goals. The two seem to be compatible.

Bagnato: It is a very mutuall beneficial relationship when th bank and HOPE can get together a way that benefits the consume that benefits the bank, that benefi the economy of the area by seeing it that there is a stable homeown base. It also benefits future growt for Western Pennsylvania b allowing employers to say:

> *This has a good economic base, good homeowner base, maybe that's a good place, good workers, good place for us to open up. Obviously it benefits the bank because we get another customer or another group of customers.*

I think that business can be a littl short-sighted by not realizing tha everything we do can benefit us an the community if it's approache properly.

Obviously we wouldn't be wit HOPE if it didn't make dollar-and cents sense; and, it does.

...Running Out Of Time, And HOPE Was There

When Mrs. Henner* called Housing Opportunities of McKeesport for assistance, she was running out of time. She had received her first notice of Sheriff's Sale, the date of which had already been posted. Prior to her call to Housing Opportunities, Mrs. Henner had sought out other assistance in an effort to save her home: HUD assignment, denied; Social Security, too young; disability, not disabled enough.

The Henners represent one of our extended families as it includes three adults and one child. The mortgagor is widowed and houses her two adult daughters, one of whom is divorced and has her own four year old daughter. One of Mrs. Henner's daughters has medical problems and was therefore receiving assistance from the Department of Public Assistance. The other daughter was struggling to meet her own monthly expenses in addition to supporting her daughter. Although the family displayed strong family unity, which proves to be a great asset in facing their individual difficulties, the daughters were not in a position to help their mother with her mortgage and utility delinquencies.

Despite having undergone heart surgery at one time, Mrs. Henner worked a full forty-hour week with occasional overtime at a department store located a good distance from her home. Her job, in addition to not supplying her with enough income to maintain her mortgage, placed a drain on her income due to gasoline and car repair expenses.

Before entering the HOPE program, Mrs. Henner had tried to arrange for partial payment with her lender. Although she would have been able to raise enough money to pay half the delinquency, she had insufficient income to manage the payment-and-a-half monthly payment required in a forbearance arrangement.

Mrs. Henner was reluctant to sell her home because of the many years of equity established and also because she could not afford the cost of renting an apartment. Locked-in and facing foreclosure, Mrs. Henner turned to the HOPE program.

Our counselor learned about a department in her mortgage corporation that handled "special" hardship cases. Through this program she was able to negotiate a payment arrangement which waived $525 of Mrs. Henner's attorney fees. Mrs. Henner was then able to raise half the balance needed to save her home. The rest was obtained from our Revolving Loan Fund. Without the Revolving Loan Fund loan she received from HOPE, Mrs. Henner would never have been able to cure her default and more than likely would have lost her home. Today, Mrs. Henner is current on her mortgage and is making monthly mortgage payments. In fact, she has already made payments on her Revolving Loan.

Even though the program has helped her through the "emergency action" stage of foreclosure prevention, HOPE is still continuing their work with Mrs. Henner. Mrs. Henner has been able to manage her monthly payments through renewed hope and a commitment to the HOPE program, and also because of the money management skills taught by her HOPE counselor.

To help them through more difficult times and with large expenses, the HOPE counselor has been able to obtain community resources for the family. Also, under the advice of her HOPE counselor, Mrs. Henner has made payment arrangements with her utility companies. In addition, HOPE continues to help Mrs. Henner to save money towards her mortgage and her utility payments by providing her with food from the Housing Opportunities Food Pantry and Round-Up Program coupons.

Once again HOPE was there to preserve home ownership.

INFRASTRUCTURE NEEDS

FOR: Trumbull County Townships, Trumbull County, Ohio

PREPARED BY: Trumbull County Township Association
Richard Orwig, Chairman, 2338 Stillwagon Rd, Warren, Ohio 44484
(216) 652-6625

1. Culvert and sleuce pipe are deteriorating faster than we have funds available for repair.
2. Roads are deteriorating faster than our budget can let us repair them.
3. Our budgets lost money on re-evaluation of property in township.
4. Levies are almost impossible to pass for road improvements because of the school and fire department needs.
5. The elimination of revenue sharing put a crimp in our plans to improve the roads and ditches.
6. Machinery and equipment repair hamper our plans for the reapir of roads and culverts and ditching program (old equipment).
7. The continuing escalating cost of insurance.
8. Continuing escalating cost of material and equipment.

Economic development has been hindered in Trumbull County due to inadequate water systems in townships.

Repaving is done every 16 to 34 years because of lacking of funding (see listing):

Howland Township - 16 years
Warren Township - 18 years
Bazetta Township - 30 years
Weathersfield Township - 34 Years

State of Ohio says that paving should be done every 7 to 10 years.
Previous storm sewers in most areas were not designed to handle the size and quantity of development that presently exists. Sewers are overtaxed and in many cases, prohibit future development.
We had major storm sewer studies done in 1986 and 1987 call for upgrades in four areas costing four million dollars and there is no funding for this.
All of these programs will create jobs, growth, cleaner environment and a better life for all of our citizens.

CONGRESSIONAL PUBLIC WORKS
COMMITTEE

The office of the Trumbull County Engineer has a sever funding problem.

Our office maintains 464 miles of road within Trumbull County and 515 bridges. The Ohio Department of Transportation has established an average life for bridges at fifty (50) years. The average age of our structures is thirty nine (39) years. We are very rapidly running out of time. One fifth or twenty percent (20%) of our structures are currently posted with a load limit of less than the legal load limit. About one half of our bridges are structurally deficient, either by load limit, narrow, insufficient waterway, deterioration, etc.

Our 464 miles of county road are also a critical condition. The Ohio Department of Transportation recommends that asphalt roads be resurfaced on a ten (10) year cycle. Past history tells us that our roads are being resurfaced on a sixteen (16) year cycle. This situation causes extremely rough roads, chuck holes, bad drainage, narrow and under capacity roads making for an unsafe road system. Similarly this impacts on signing, guard rail, signal systems, culverts, roadside drainage and pavement markings.

The above situation exists even though we have utilized an average of over 1.2 million dollars of federal funding on our county road system per year.

I have enclosed a highway system needs booklet which was developed by our office when we attempted to secure additional automobile registration fees.

Hopefully your committee will recognize local government's need for additional funding.

Very truly yours,

Edward E Ryser
Edward E. Ryser, P.E.
Trumbull County Engineer

INTRODUCTION

1. What are the Duties of the County Engineer?

All maintenance, repair, widening, resurfacing, reconstruction, and construction of pavements and bridges on the county highway system is the County Engineer's responsibility. This includes traffic control, safety, mowing, and snow removal.

2. How are the County Engineer's obligations funded?

Basically, bulk of the Revenues available to the County Engineer are derived solely from Motor Vehicle Registration and State Gasoline Taxes.

By law, the use of said Funds is absolutely restricted:

> "for the planning, construction, reconstruction, improvement, maintenance, and repair of roads and highways, and maintaining and repairing bridges and viaducts."

The County Engineer receives no monies from Real Estate Taxes.

Currently, the automobile registration fee in the unincorporated area of Trumbull County is twenty ($20) dollars.

The fee in the cities and villages of Cortland, Girard, McDonald, Niles, Newton Falls, Warren, and West Farmington is twenty five ($25) dollars.

3. Why does the County Engineer require additional monies?

The last time the County Engineer received an increase in revenues was in 1980 when the State Legislature increased the Vehicle Registration.

The State Legislature has recognized the dire need of the County Engineer for additional revenues to fulfill the obligations mandated by law.

Last year, 1987, the Legislature enacted statutes authorizing Counties to enact Permissive Motor Vehicle License Taxes.

The Trumbull County Engineer will be requesting the Commissioners enact two (2) phases of said tax for the benefit of the County Engineer, the Municipalities, and the Townships.

Each of said phases provides for a five ($5) dollar increase or a total of ten ($10) dollars.

AREAS OF NEED

- Bridges
- Roads
- Safety Upgrading
  - Guardrail
  - Signs
  - Signals
  - Culverts
  - Roadside Ditches
- Equipment Replacement

BRIDGES

- 515 County Bridges
- $ 90,000,000
  Replacement Cost
- Design Life = 50 years
  Average age of our bridges = 39 years
- Replacement Goal
  11 bridges/year
- Maintainence ($ 346,000)

WHAT WILL YOUR MONEY BUY?

Your $ 2,092,710 Will Provide:

- 5 More Bridges/Year
- 17 More Miles Of Resurfacing/Year
- 3 to 4 More Safety Upgrading Projects/Year
- More Reliable Equipment

The County Engineer Will Commit These Funds To Capital Improvements

TO SUMMARIZE

- Duty To Maintain Highway System
- Federal And State Standards
- Existing Needs $ 4,917,000
- Present Funding $ 2,544,000
- Annual Shortage $ 2,373,000
- More Efficient Use Of Funds And Manpower
- $ 10 User Fee Increase Provides $ 2,092,710
- Safer County Highway System

ACTION REQUESTED

- Request That Legislation Be Passed Establishing The $ 10 License Fee Increase In The County of Trumbull

WHEREAS, the Trumbull County Engineer, in order to properly maintain, repair, widen, resurface, reconstruct, and construct roads and bridges on the County Highway System is in dire need of additional funds; and

WHEREAS, the only practicable method available for said purpose is by a permissive license fee as authorized by Statutes enacted by the Ohio State legislature; and

WHEREAS, the County Engineer has determined that their is a urgent need to request the Commissioners of Trumbull County to pass a Resolution in accordance with O.R.C. 4504.15 for a permissive license fee of five ($5.00) dollars; and a Resolution in accordance with O.R.C. 4504.16 for additional fee of five ($5.00) dollars; and

WHEREAS, each of the Townships in Trumbull County will receive thirty (30%) per cent of said fees on all motor Vehicles registered within the un-incorporated area of each respective Township.

Now, Therefore be it resolved by the Trumbull County Trustees Association that:

1. We recognize the need of the Trumbull County Engineer for additional funds to maintain the roads and bridges on the County Highway System.

2. We further recognize that said funds, by law must be used for road and bridge purposes only.

3. We hereby endorse the enactment of Resolutions by the Commissioners of Trumbull County to complete the passage of said permissive license fees.

Passed the 3rd day of March, 1988 at a meeting of the Association of Trumbull County Trustees.

Infrastructure Needs

for

The City of Warren, Ohio

"Committee On Public Works Infrastructure Hearing"
July, 16, 1990

Good afternoon.

It is my honor to be here today to testify before this committee as the Mayor of the City of Warren, with other officials from our area.

Warren, which is part of this Mahoning Valley, has had a very important history in the early economic development of our country. Warren and our neighboring communities historically have made large investments in the local infrastructure. And while we were growing and making large investments, our residents were paying taxes, which not only came back to our area, but went to other parts of our country which were not as industrialized and did not have the tax base of the communities in the Mahoning Valley.

Everyone is familiar with the loss of jobs and industry that hit Warren and the Valley in the 1970's and 1980's. Warren lost population for more than a decade, and with the loss of people, Warren was hit with a decreasing tax base. We have the same areas to service, plus new areas that need services with a decreased tax base. It has been very difficult to maintain the old infrastructure, while trying to attract new jobs and industry, which demand new infrastructure.

I have been watching closely the situation with the Savings and Loans in the Southwestern United States. Many of the Congressmen are saying that rest of the nation including our area are going to have to pay for this bailout. Taxes from our area have been going for decades to develop the Southwest. It is time that Congress pay special attention to our area, the area that has been one of the industrial backbone areas of our country.

We have great infrastructure needs so that we can maintain services to our existing industry and citizens. Warren has a drinking water system with water lines in areas that are over 70 years old. During the Winter when the ground freezes and moves, we have frequent line breaks on the old lines. Some old lines in residential areas are over 50 years old, and with the minerals that build up in the lines, water flow has been reduced. Warren does not have the resources to make the replacement of old lines that need to be made, nor do we have the resources to upgrade system capacities in areas that are undersized.

With the new EPA requirements, the City of Warren will be making large investments in the Water Filtration Plant. This water plant not only serves the citizens of Warren, but it also serves parts of Howland, Champion, Bazetta, and Warren Townships, and part of Lordstown Village. Even with the user fees(water bills) that the City receives, it will not be enough to make the major investments which will be needed in the system, especially the waterline replacements.

In the area of storm sewers, less than 50% of the areas in the city have adequate storm sewers or adequate capacity in the existing system. I would say that almost every area in the city has areas that need upgrading of the storm sewer system. The city does not have a source for funding for storm sewer infrastructure needs. Small amounts of funding are provided from our General Fund revenues, to take care of areas of critical need, but this is only a tempory patch for the system. About 5 years ago, we had a consultant do a study on the known repairs that were need to help alleviate flooding in the City, and at that time it was estimated that these repairs would cost over 10 million dollars. That number is even higher today.

Sanitary sewers are a high priority. Warren has been working for years to make improvements in this system. The "Red Run Sewer", a new interceptor sewer which runs from the north side of the city to the south end was completed about 10 years ago. This helped to alleviate flooding throughout the central parts of the city. There is still need on the east and west sides of the City to upgrade the sanitary sewer sytems. We have been working for years to eliminate illegal connections into the sanitary system and have made much progress in reducing storm water coming into our system.

There are other areas that we have great infrasture needs that the city does not have the resources for. We have sanitary sewers near the downtown, that area has sewers made of bricks, which require mintenance. These sewers need replaced. There are other areas in the city which the sewer capacity is at a maximum. These sewers need replaced with sewers of larger capacity. We have areas that need interceptor sewers built to relieve flooding. The "Grandview Interceptor" is an example of this. It will relieve the Southeast part of the city of sanitary sewer problems they have been having. We have the plans complete for this project, but no means to fund it.

Streets and maintenance are a year around effort. The City has enacted a $10 license plate tax to help fund a street maintenance program. We intend to use these monies to provide for the local match to generate funds for the State Bond Issue 2 program for maintaining our street infrastructure. State Issue 2 requires a minimum of a 10% local share. We are finishing the second year of this program and the City has conducted a City-Wide street resurfacing program. We have another program in which we are cutting out and replacing sections of concrete street. Many of the streets are 40 years old. After the replacement the bad sections, these streets should be good for several decades. Even though "Issue 2" is a help, it only provides for a small fraction of the monies needed for infrastructure repair and replacements of a community.

Solid Waste is an area not only of local concern, but it is a national problem. The Eastern seaboard states have run out of areas for landfills and are whipping there waste to the west. Some of this waste is ending up in Ohio. The landfill that the City of Warren has been using, according to our best information, is about ready to close. We have our own Sanitation Department and have serviced our citizens efficently and inexpensively during my term as Mayor for the past 10 years. The next 10 years are not going to be like the past 10. There are difficult and expensive decisions which will have to made in the near future. Many of the decisions may not be politically popular. These are not easy decisions to be made. With the filling-up and closing of many landfills, the tipping fees will be increasing substantially. In our case, there may not even be a landfill in our area that will even be open. There are expensive decisions to be made in this area of "Solid Waste".

As Mayor of the City of Warren, I am asking you as Members of Congress, to look at the infrastructure needs of the our community. Our community shares the same infrastructure needs as the other communities in our "Mahoning Valley". We are not in the position we were 20, 30 and 50 years ago. I ask your support for us, as we have long supported you in the economic development of our nation. We need your assistance to maintain and upgrade the infrastructure of our city. Please don't forget us.

Respectfully,

Daniel J. Sferra, Mayor
City of Warren, Ohio

THE FOLLOWING ARE THE INFRASTRUCTURE NEEDS FOR THE CITY OF WARREN, OHIO FOR THE NEXT FOUR YEARS RELATING TO OUR TRANSPORTATION NEEDS:

PROJECT	YEAR	ESTIMATED COST
1. CONCRETE STREET REHAB PROGRAM PHASE II	1991	$450,000.00
2. CITY WIDE STREET TREATMENT PROGRAM	1991	250,000.00
3. CONCRETE CUTBACK PROGRAM	1991	175,000.00
4. N. PARK AVENUE REALIGNMENT	1991	600,000.00
5. STREET RECONSTRUCTION & RESURFACING	1991	250,000.00
TOTAL		$1,725,000.00

PROJECT	YEAR	ESTIMATED COST
1. CONCRETE STREETS REHAB PROGRAM PHASE III	1992	$450,000.00
2. CORNER CUTBACK PROGRAM	1992	175,000.00
3. BUS PAID REHAB PROJECT	1992	150,000.00
4. CITY WIDE STREET TREATMENT PROGRAM	1992	250,000.00
5. SANITARY SEWER REHAB PROGRAM	1992	300,000.00
TOTAL		$1,325,000.00

PROJECT	YEAR	ESTIMATED COST
1. CITY WIDE STREET TREATMENT PROGRAM	1993	$300,000.00
2. SANITARY SEWER REHAB PROGRAM	1993	200,000.00
3. STREET RECONSTRUCTION & RESURFACING	1993	250,000.00
4. STORM SEWER PIPE & HEADWALL REPAIR	1993	75,000.00
5. ESTABROOK AVE. STORM SEWER REHAB	1993	350,000.00
TOTAL		$1,175,000.00

PROJECT	YEAR	ESTIMATED COST
1. STREET RECONSTRUCTION & RESURFACING	1994	$250,000.00
2. CITY WIDE STREET TREATMENT PROGRAM	1994	300,000.00
3. SANITARY SEWER REHAB PROGRAM	1994	200,000.00
4. STORM INLET REHAB	1994	150,000.00
5. CURB REHAB PROJECT	1994	150,000.00
TOTAL		$1,050,000.00

U.S. HOUSE OF REPRESENTATIVES

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

"THE FUTURE OF OUR NATION'S INFRASTRUCTURE NEEDS"

TESTIMONY OF:

MR. CHARLES W. SYAK
CHAIRMAN OF THE BOARD & CHIEF EXECUTIVE OFFICER
SYRO STEEL COMPANY
1170 NORTH STATE STREET
GIRARD, OHIO 44420

JULY 16, 1990

INTRODUCTION

GOOD AFTERNOON MR. CHAIRMAN, MR. TRAFICANT AND MEMBERS OF THE PUBLIC WORKS AND TRANSPORTATION COMMITTEE --- MY NAME IS CHARLES SYAK AND I AM CHAIRMAN OF THE BOARD AND CHIEF EXECUTIVE OFFICER OF THE SYRO STEEL COMPANY LOCATED HERE IN GIRARD, OHIO.

I THANK YOU FOR INVITING ME TO ADDRESS YOU ON THE SUBJECT OF OUR NATION'S INFRASTRUCTURE NEEDS --- BUT FIRST --- LET ME COMMEND THIS COMMITTEE FOR TRAVELLING THROUGHOUT THE COUNTRY SEEKING A FIRST HAND VIEW OF THE ECONOMIC FIBER OF THE MANY DIVERSE ELEMENTS THAT GO INTO THE BUILDING OF ONE OF THE WORLD'S MOST PRIZED PUBLIC WORKS PROJECTS --- THE SELF-FUNDING INTERSTATE HIGHWAY SYSTEM.

I AM ESPECIALLY PLEASED THAT THE CONGRESS WOULD COME TO THE YOUNGSTOWN AREA --- TO PERSONALLY VIEW AND HEAR FROM THE PEOPLE WHO MAKE UP ONE OF THE MOST POTENTIALLY DYNAMIC ECONOMIC REGIONS OF THE COUNTRY. FOR MANY YEARS THIS AREA WAS ONE OF THE NATION'S LEADERS IN THE PRODUCTION OF STEEL AND OTHER BASIC BUILDING BLOCKS --- NECESSARY TO CREATE AND MAINTAIN AN ECONOMICALLY VIABLE INFRASTRUCTURE.

TODAY MR. CHAIRMAN --- THE ROBUST ECONOMY OF THE "STEEL BELT" HAS TURNED INTO THE SLUGGISH ECONOMY OF THE "RUST BELT".

IS IT COINCIDENCE THAT OUR PRODUCTIVITY --- GROWTH AND ECONOMIC EXPANSION DISAPPEARED -- AT THE SAME TIME --- THAT THE RATE OF OUR NATIONAL PUBLIC INVESTMENT IN INFRASTRUCTURE FELL?

I DO NOT THINK SO --- THERE IS A DIRECT LINK BETWEEN PUBLIC INVESTMENT IN OUR INFRASTRUCTURE AND OUR ECONOMY.

MR. CHAIRMAN, INFRASTRUCTURE AND SAFETY ARE A PART OF OUR ECONOMIC WELL BEING. THE SYRO STEEL COMPANY HAS BEEN INVOLVED IN HELPING TO BUILD OUR NATION'S TRANSPORTATION ---"INFRASTRUCTURE" FOR OVER 35 YEARS. PRODUCTS SUCH AS GUARD RAIL, BRIDGE RAIL, STEEL BIN WALLS, CORRUGATED SHEETS FOR OVERPASS AND UNDERPASS STRUCTURES, CRASH BARRIERS, SHEET PILE --- AS WELL AS SPECIALTY PRODUCTS FOR THE NATION'S RAILROAD CAR BUILDERS AND BARGE BUILDERS HAVE BEEN AN INTEGRAL PART OF OUR NATIONS HIGHWAY, BRIDGE AND

AND TRANSPORTATION SYSTEM SINCE THE INCEPTION OF THE INTERSTATE HIGHWAY SYSTEM --- FURTHER --- AN ONGOING R&D PROGRAM DEVOTED TO HIGHWAY SAFETY IS A TOP PRIORITY AT SYRO.

TODAY I WOULD LIKE TO ADDRESS OUR NATION'S INFRASTRUCTURE NEEDS FOR HIGHWAY AND BRIDGE SAFETY.

MR. CHAIRMAN, AS YOU KNOW, TITLE 23 OF THE UNITED STATES CODE GOVERNS THE FEDERAL-AID HIGHWAY PROGRAM --- AND 23 USC 152 WAS ENACTED TO ELIMINATE HAZARDS ASSOCIATED WITH OUR ROADWAYS. --- THIS SAFETY CONSTRUCTION PROGRAM IS APPROPRIATELY KNOWN --- BY THIS COMMITTEE --- AS THE HAZARD ELIMINATION PROGRAM.

THE HAZARD ELIMINATION PROGRAM IS DESIGNED TO IMPROVE SAFETY ALONG PUBLIC ROADWAYS --- AND TO REDUCE ACCIDENT AND FATALITY RATES ASSOCIATED WITH GENERAL ROADSIDE HAZARDS. IT IS COMPREHENSIVE AND AUTHORIZES --- A DIVERSE SET OF PROJECTS. SECTION 152 CARRIES OUT ITS MISSION THROUGH THE USE OF SEVERAL MANDATES. SINCE THIS COMMITTEE IS AWARE OF THESE MANDATES THEY NEED NOT BE ADDRESSED AT THIS TIME.

AS TO THE FUNDING --- LET ME SAY THAT THIS COMMITTEE HAS AUTHORIZED $170 MILLION PER YEAR --- TO BE APPORTIONED TO THE STATES FOR SECTION 152 PROJECTS. THE FEDERAL SHARE OF COSTS ASSOCIATED WITH PROJECTS AUTHORIZED IN ACCORDANCE WITH SECTION 152 IS 90 PERCENT.

A DISTURBING FACT IS THAT SOME STATES. LIKE CALIFORNIA WITH $8.253.059.09 AND OHIO WITH $19,894,470.54 HAVE MANY, MANY MILLIONS OF UNOBLIGATED FEDERAL FUNDS --- JUST SITTING IN THEIR ACCOUNTS.

OTHER STATES, LIKE ARKANSAS WITH $1,468.00 AND ILLINOIS WITH $32,644.75 --- HAVE LITERALLY SPENT ALL OF THE FUNDS APPORTIONED TO THEM UNDER 23 USC 152.

WHAT ARE THE ACCOMPLISHMENTS OF OUR SAFETY PROGRAMS INCLUDING SECTION 152, THE HAZARD ELIMINATION PROGRAM?

TRULY INCREDIBLE SUCCESSES HAVE RESULTED SINCE 1974 --- F.H.W.A. ESTIMATES INDICATE THAT SAFETY PROJECTS ARE RESPONSIBLE FOR SAVING OVER 55,000 LIVES AND PREVENTING OVER 1 MILLION SERIOUS INJURIES. ADDITIONALLY --- FATAL, INJURY, AND FATAL-PLUS-INJURY ACCIDENTS HAVE BEEN REDUCED BY 47%, 22% and 23% RESPECTIVELY.

WHAT IS THE COST?

IT HAS COST APPROXIMATELY $338 THOUSAND PER FATAL, AND $13.6 THOUSAND PER FATAL-PLUS-INJURY ACCIDENTS REDUCED. THE SURPRISING SUCCESS OF THIS PROGRAM COMBINED WITH THE RELATIVELY LOW COST OF THAT SUCCESS --- MAKES YOU WONDER WHY SECTION 152 FUNDS SIT IDLE IN THE UNOBLIGATED ACCOUNT OF SOME AFOREMENTIONED STATES.

CONCLUSION

THE SURFACE TRANSPORTATION ASSISTANCE ACT OF 1986 EXPIRES AT THE END OF FISCAL YEAR 1991 --- THE INTERSTATE SYSTEM WILL ALSO BE COMPLETED --- NEW LEGISLATION, BASED ON HEARINGS JUST LIKE THIS ONE, WILL REFLECT NECESSARY CHANGES IN AMERICA'S TRANSPORTATION NEEDS. WITHOUT A DOUBT --- THE HAZARD ELIMINATION PROGRAM REFLECTS THE WISE INVESTMENT THAT THIS COMMITTEE MADE TO BENEFIT OUR NATION'S ROADWAY USERS. WE HAVE A GOOD PROGRAM THAT HAS SAVED LIVES, REDUCED SERIOUS INJURIES AND PERSONAL PROPERTY DAMAGE. I STRONGLY RECOMMEND THAT THIS COMMITTEE EXTEND THIS PROGRAM -- AS IS --- IN THE FORTHCOMING FEDERAL AID HIGHWAY ACT OF 1991. --- GENTLEMEN --- ITS WORKING --- IT AIN'T BROKE --- SO LET'S NOT ATTEMPT TO FIX IT. IF ANYTHING --- TRY TO SQUEEZE SOME ADDITIONAL DOLLARS INTO THE PROGRAM SO THAT THE SAFETY BENEFITS WE ENJOY TODAY MAY BE FURTHER ENHANCED AND SHARED BY THE HIGHWAY USING PUBLIC.

SECRETARY OF TRANSPORTATION SKINNER HAS INDICATED THAT THE NEW TRANSPORTATION POLICY --- SHOULD CONTAIN A HIGHWAY PLAN DESIGNED TO CARRY US INTO THE NEXT CENTURY. HE ADVOCATES A PLAN --- THAT WOULD ELIMINATE THE HAZARD ELIMINATION PROGRAM AND INTRODUCE A SAFETY SYSTEM WITH VERY LITTLE FEDERAL CONTROL.

CAN WE AFFORD TO ELIMINATE THE SECTION 152 PROGRAM?

I THINK NOT. 23 USC 152 IS A HIGHLY SUCCESSFUL SAFETY PROGRAM. THE BOARD DIVERSIFICATION OF SAFETY PROJECTS IMPLEMENTED UNDER SECTION 152 MAKES THE PROGRAM A LINCHPIN --- TO THE ENTIRE HIGHWAY SAFETY MOVEMENT.

TO SPLINTER OUR NATION'S HIGHWAY SAFETY INTO 50 INDIVIDUAL PROGRAMS WOULD DO IRREPAIRABLE DAMAGE TO OUR NATION'S SAFETY PROGRAM. FEDERAL CONTROL WILL PROVIDE A UNIFIED EFFORT FOR R&D, REDUCE COSTS, AND MAINTAIN THE NECESSARY STATE OF THE ART AS IT IS DEVELOPED.--- AS A MANUFACTURER, I CANNOT CONCEIVE OF 50 VARIATIONS OF A SINGLE SPECIFICATION --- ACHIEVING THE DESIRED RESULTS, INCLUDING COST SAVINGS. THE NEED TO CONTINUE THE PROGRAM IS ILLUSTRATED --- BY THE CONSTANT REDUCTION IN ACCIDENTS AND DEATHS, COMBINED WITH THE EVER PRESENT NEED TO UPGRADE AND IMPROVE THE ROADWAYS. TO ALLOW SECTION 152 TO BE DISMANTLED WOULD CONSTITUTE A SERIOUS BLOW TO THIS COMMITTEE'S ENVIABLE RECORD IN SUPPORT OF HIGHWAY SAFETY.

I URGE YOU TO REAUTHORIZE THE HAZARD ELIMINTION PROGRAM AND INCLUDE HIGHWAY SAFETY AT THE TOP OF YOUR LIST OF INTRASTRUCTURE NEEDS.

THANK YOU.

(Page 1 of 2)

TESTIMONY
OF
JOHN P. WARGO - CHRMN.
COLUMBIANA COUNTY BOARD OF
COMMISSIONERS
(Courthouse - Lisbon, Ohio 44432)

Presented to: U.S. House of Reps. - Public Works and Transportation Comm. - Hon. Glenn Anderson - Chrmn. July 16th 1990 at Youngstown, Ohio.

My views as to the Infrastructure needs of the Ohio Valley are presented from 30 years of Political and Governmental involvement, these are: Deputy County Auditor - 3 yrs. County Recorder - 6 yrs. Township Trustee - 3 yrs. Ohio House of Representatives - 12 yrs. County Commissioner - 6 yrs.

1. There is a critical need to complete the Highway links with Ohio and the Pittsburgh Penna. area. This is even more important now that the $600,000,000.00 Expansion and Renovation of the Greater Pittsburgh Airport has begun. This is now an International Airport. Our 4-Lane Roadways stop at East Canton and Alliance, Ohio which is 50 miles to the west of Pittsburgh.

2. The second critical need would not only serve the Ohio Valley, but would impact on the greater part of the U.S. and help our nation regain our Competitive Trade balance. Japan has proven as far back as 30 years ago that scrap steel could be shipped to Japan by water. This scrap is then processed and shipped again by water around the Earth, Mostly to the U.S. This is done at a profit. Water is Cheap Transportation.

A waterway must be constructed from the Ohio River to the Great Lakes. Pres. Franklin Roosevelt signed the authorization just prior to the second World War. Nothing has been advanced since that time.

Our critical need to produce steel and ship at a cheap rate would immensely assist the U.S. balance of Trade.

This region is also a heavy producer of Grain, Coal and Timber.

The proposed Waterway-Canal would be constructed through 4 counties for a Distance of Approx. 130 miles. The Feasibility Study for this project by the Army Corp. of Engineers is now underway.

We cannot wait for the world to come to us in our time of Economic need. If that is so, then we will be passed by. Our U.S. Monies must be used here in our country for our people.

The Eastgate Development and Transportation Agency (EDATA) is the designated Areawide Water Quality Management Agency for Mahoning and Trumbull Counties, Ohio. As such, staff began planning for regional water quality improvements in 1972 as first advanced in Section 208 of Public Law 92-500.

With this experience in water quality planning, Congressman Traficant requested the agency's participation along with other units of local government, to investigate regional water distribution problems in order to meet the areas current and future conveyance needs.

A natural equilibrium exists between water supplied and the demand for that water. Within the Mahoning Valley water provided to meet this condition is derived from onstream reservoirs, the Mahoning River, and groundwater. Over the past years geographic patterns of water demand for industrial, residential, and commercial growth have changed sharply. Emphasis in the Valley is now being placed on the coordinated utilization of existing water resources by all existing users.

Over one-half million people live in Mahoning and Trumbull Counties. However, this may be dramatically reduced if population projections as prepared by the Ohio Department of Development as shown on the attached graph are correct. Seventy-two percent of the current population is supplied by 26 centralized water systems that deliver approximately 61 million gallons per day. Due to funding constraints existing systems which are in dire need of repair are incapable of extending services to areas of potential development. Financial resources to meet both present and future requirements are extremely limited and divided among many needs. All costs to insure proper operation and maintenance are paid by users of the various systems. Infrastructure expansion must also be paid from revenues generated by users of the system.

Generally, water supplies within the region are adequate to meet existing and near term projected demand. However, construction of water mains and appurtenances to deliver potable water to areas of potential development are beyond the scope of financial resources currently available.

Counties in Ohio may acquire, construct, maintain and operate all phases of a public water system as long as the territory served is within an established sewer district. Despite these rather broad powers, Mahoning and Trumbull Counties have limited their role in supplying water primarily to distribution. Neither county owns or operates reservoirs or full-scale treatment facilities, but both do own, and in some cases, maintain lines through which the water is distributed.

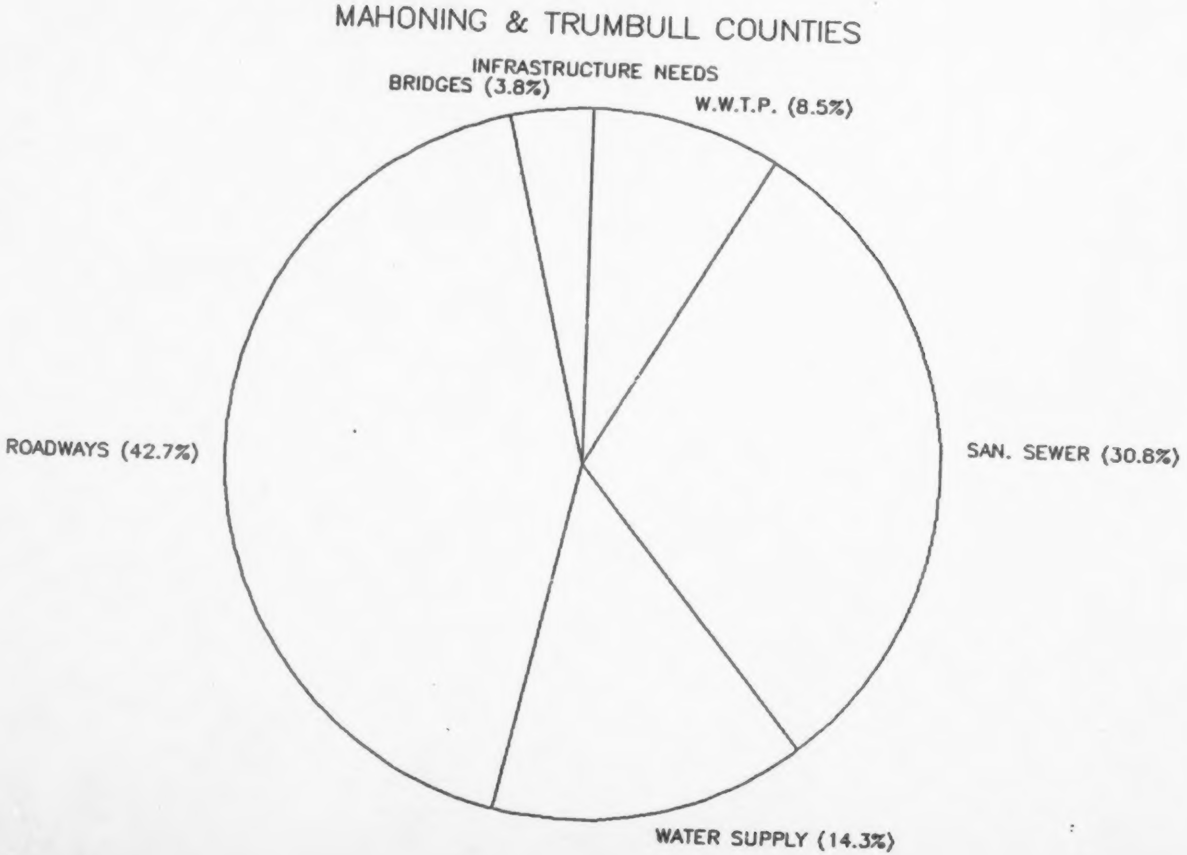
Generally, water for the unincorporated portions of the two counties is supplied by municipalities or private water companies. Each county has made its own arrangement for delivery of this water from the source to the consumer and these vary not only between counties but among different areas within the same county.

Trumbull County exhibits the greatest variation. Some areas of the county receive water purchased from the cities of Warren, Niles, Newton Falls, or Ohio Water Service Company, which is then distributed through lines owned and maintained by the county. Other areas receive water from the cities of Youngstown, Girard, or McDonald under contracts which provide for municipal use of county lines rather than the actual purchase of water by the county. The City of Warren has extended its own lines to supply several small unincorporated areas adjacent to the city.

In Mahoning County the majority of water is distributed by two entities - the City of Youngstown and Ohio Water Service. Youngstown supplies unincorporated areas roughly west and southwest of the city limits. The Ohio Water Service supplies water to portions of those townships southeast and south of Youngstown. It owns and maintains all of the necessary facilities to provide this service including reservoirs, treatment facilities and distribution lines. Although a private firm, it operates as a public utility.

Five year plans developed by communities within the region for the State Infrastructure Improvement Program (Issue 2) identified the need for fifty-two water treatment and conveyance projects with an estimated total cost of $39,242,924. Thirteen projects were also listed for improvements to Wastewater Treatment Facilities at an estimated cost of $23,370,000. Seventy-one sanitary sewer projects were identified as necessary upgrades for existing users as well as expansion of systems to provide for future economic development. The total estimated cost within the five year plan for sanitary sewers amounts to $84,783,555. Water, wastewater facility, and sanitary sewer projects filed under the Infrastructure Improvement Program are not all inclusive. The larger cities of Youngstown and Warren did not apply for these types of projects which require capital expenses well beyond the limited dollars being supplied to the district.

The need to repair, replace and expand our water and wastewater infrastructure is extensive. These projects are critical to maintain existing services and support economic development within the area. Consideration of Federal funding to assist local communities with these projects may be appropriate.

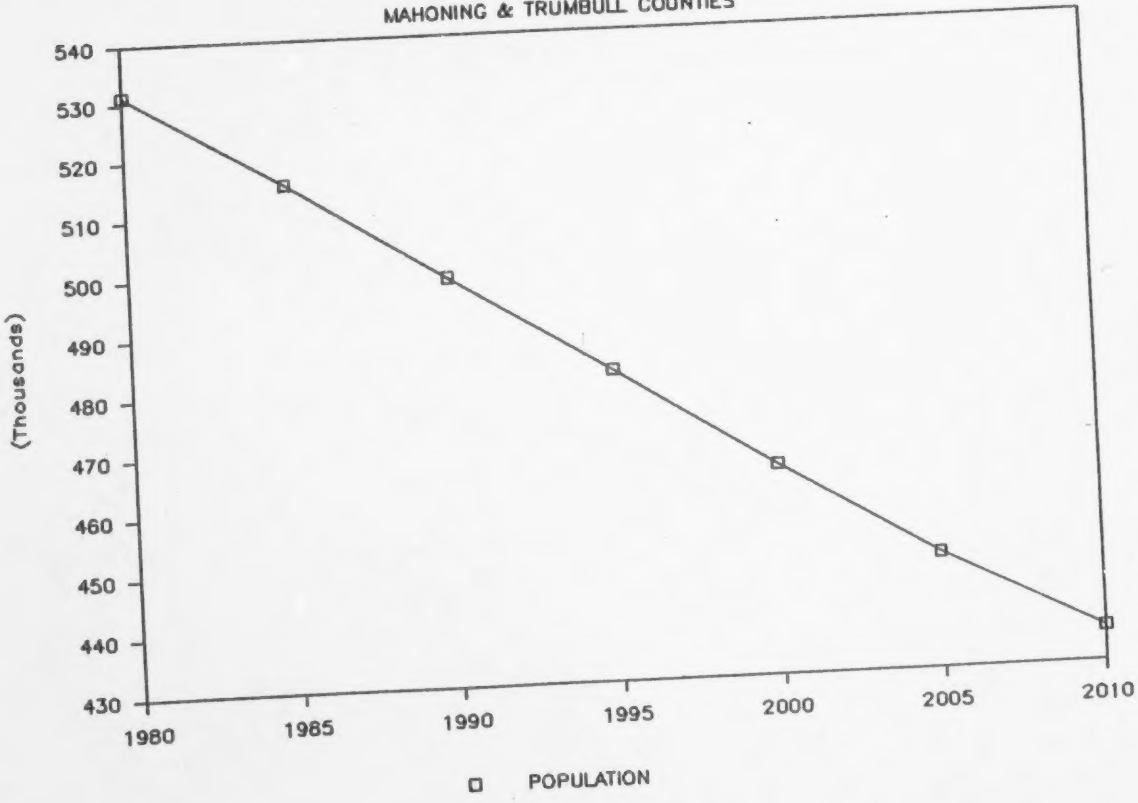


MAHONING & TRUMBULL COUNTIES

INFRASTRUCTURE NEEDS

POPULATION PROJECTIONS

MAHONING & TRUMBULL COUNTIES



TO EXAMINE THE FUTURE OF OUR NATION'S INFRASTRUCTURE NEEDS

MONDAY, AUGUST 6, 1990

House of Representatives,
Committee on Public Works and Transportation,
Lafayette, LA.

The Committee met, pursuant to call, at 2:19 p.m. in Hamilton Hall, University of Southwest Louisiana, Lafayette, Louisiana, Hon. Glenn Anderson (chairman of the committee) presiding.

The Chairman. The meeting will come to order. Good morning, ladies and gentlemen. The House Committee on Public Works and Transportation hearing on the future of our Nation's infrastructure needs will come to order. I want to welcome you here today and I want to thank you for taking time from your busy schedules to share your knowledge, your concerns and your perspectives with us about this important issue.

Earlier this year, our Committee initiated a series of events designed to give us a better understanding of our Nation's infrastructure crisis. At our first event in Washington, we looked at emerging infrastructure needs from a national point of view. Our second and third events focused on the impact of infrastructure on the productivity, growth and ability of our country to compete in international markets. Future hearings will examine infrastructure financing alternatives and new technologies.

It is very important, however, for us to get a good look at the infrastructure problems encountered at the local and state levels. Our meeting here today in Lafayette is the third in a series at various sites around the Nation to review infrastructure needs with the people most directly involved, and to hear a broad range of ideas to help resolve the problems. Previously, we held field hearings in St. Clairsville and Youngstown, Ohio, and tomorrow we will meet in Texas and Wednesday in Atlanta, Georgia.

It is a great pleasure to join Jimmy Hayes for this hearing and I want to thank him and the people of the Seventh District for their gracious hospitality. Although Jimmy has been in Congress for only a short time, he has already demonstrated his effectiveness and his dedication to the people of the Seventh District. And as a member of our Subcommittee on Water Resources, he has fought hard for the commercial fishermen, farmers and oil and gas interests in his area and is the author of the Wetlands Conservation Initiative Act of 1990. This legislation, H.R. 4212, has captured a great deal of attention nationally, including in my home state of California. At the current time there are over 50 co-sponsors representing nearly 30 states on the proposal which will have a profound impact on national wetlands policy. He has also pushed for the development and deployment of advanced transportation technologies that are environmentally clean and energy efficient. He is the author of House Concurrent Resolution Number 232, expressing the sense of Congress concerning the need to examine the contribution which magnetically levitated and propelled transportation systems could make to both the transportation infrastructure and the world competitiveness of the United States.

Jimmy's service on the Science, Space and Technology Committee has also been felt directly by his District, not only through his efforts with the National Science Foundation grants to McNeese University and the University of Southwestern Louisiana, but also with the shellfish indicator study program sought for the Research Center at USL.

I just want to congratulate you—you are doing too good almost.

I would also like to welcome Congressman Pete Geren to our hearing today. Pete represents the 12th District of Texas and brings to us a very thorough working knowledge of the political process and a special interest in water resources and aviation. Pete, we appreciate your presence here this afternoon.

As Jimmy and Pete well know, when we talk about infrastructure, we are talking about the very cornerstone of our cities and rural communities. It may not be an exciting subject, but it is infrastructure that provides the foundation for a sound economy and is at the very heart of the standard of living and quality of life that Americans enjoy.

From our previous hearings, we know that not only do many problems exist with our public works facilities, but we have been short-changing our public works investments for more than 20 years. The question we ask today is: What about Louisiana's infrastructure? How adequate is its network of public facilities—the roads, the bridges, the public buildings, the prisons, the sewers, wastewater treatment facilities, water supply facilities, dams and other public works—to meet current needs?

In addressing this issue, we should all keep in mind that economic research in recent years has tied the level of public spending on infrastructure to the productivity rate in the private sector. The United States productivity growth rate fell from 1.8 percent annually in the 1960s to less than one percent, .7 percent, in the early 1980s. And during that same period, the annual growth rate of investment in infrastructure—that is what you need, an increase in the growth rate of investment—fell from 4.5 percent again to less than one percent, to .8 percent. Those are shocking figures.

Productivity in our country, as I mentioned a moment ago, is growing much more slowly than in other developed countries such as Japan, West Germany, Canada, France, Italy and the United Kingdom, some of which, incidentally, invest two to five times as much in their public works as does the United States. And I mention that Japan spends five times as much and West Germany spends twice as much.

Today, we look to you to help us gain further insight into your infrastructure needs: What is the condition of and how adequate is your infrastructure to meet the area's current and anticipated needs?

Who do you think should pay for the necessary public works and what financing techniques have you considered? What do you think the federal role should be? The state role? The local role? And finally, what should our Committee be doing to resolve some of these problems?

As we continue our inquiry and debate on how to deal with the current and the anticipated needs of our public works, we look forward to your answers and to questions that you may raise.

And now I would like to recognize Congressman Hayes and Congressman Geren for any opening remarks that they might wish to make.

Mr. **Geren**. Thank you, Mr. Chairman. I want to commend you for holding these hearings, both in Louisiana and in Texas. Both of our states share common history, common industrial base and both of us face the same challenges in the future to build on the lessons we have learned over good years and the last several tough years, and start building a new future for each of our states.

You have done an excellent job of summarizing the challenges and the problems before us, and I will not attempt to even add to that other than thank you for hosting these hearings and for your leadership on this very important issue.

I want to thank Jimmy Hayes for hosting this here in Lafayette and I want to compliment the people of this Congressional District for having the good sense to send Jimmy to Washington—not so much how we all like Jimmy up there, but because of his lovely wife, Leslie, who has brought the grace and charm of Lafayette to Washington, and she is unquestionably the best cook in Washington, DC, and all his colleagues enjoy her culinary talents very much. But seriously, Jimmy is an outstanding member and I have had the privilege of working with him my short time in Congress on the Public Works Committee.

I do not think there is any task in front of us more important than convincing this nation to make the investment that we need in our nation's infrastructure, and that is the purpose of these hearings, to learn from you what we need to be doing.

Congressman Hayes, Chairman Anderson, thank you for letting me participate in these hearings and thank you for hosting them today.

Mr. **Hayes**. Thank you very much.

It was in this room in 1957 when as a child I learned that the Soviet Union had launched what is now no larger than a grapefruit but what seemed like the alternation of all mankind, into a low earth orbit, and what the school children referred to as Sputnik had prompted a debate as to whether or not this country was a world leader or in fact whether or not we were watching other forces change the shape of the globe.

I remember being frightened, not from military invasion, but the idea that my country which I had grown up to believe had absolutely no peer or competitor, in fact could not do something that someone else could.

I thought about that recently because now, instead of one dramatic event, we are seeing a cluster of indicators that are pointing to the same conclusion. As the Chairman pointed out earlier today, this country ranks 55th in the world in development of infrastructure and the amount of money which we are willing to put behind our needs and ideas. The country of Japan, which is roughly a quarter the size of California, spent five times more than America in infrastructure. West Germany, which is much smaller than some Congressional Districts in Texas, spent twice as much as this country. They did not do that because they are benevolent. They did that because they are malevolent economically, and understand that the way to beat us is to build the roads and bridges that allow them to get to each other rapidly and open the channels of commerce.

It is time for our country to respond to that in the same manner that young President Jack Kennedy responded to the Soviet challenge by declaring that by the end of the decade we were going to do something that no one had ever done before, to place an American footprint on the moon. I remember seeing that moment as well.

And in the course of the next decade, I intend to see the time when we reverse those economic indicators, when we recognize that the value of Cameron Parish is the ability to sell seafood products, not the ability to find them there. That the strength of McNeese University lies not on the campus, but in bringing the campus to the rest of the city and vice versa, so that both can benefit from water quality studies and from the ability to improve the environment, at the same time to stretch those north-south roads on 171 so it is possible to travel in that north-south corridor as it is east-west on I-10. It is important for us to understand here in Lafayette, Louisiana, that despite recent events of the last few weeks where oil prices are high—oil prices were high once before and let us hope that we learned from that moment to recognize that it is what is left behind in concrete and roads and bridges and sewerage and waste disposal that allows an economy ultimately to prosper. It is doing the right things at the moment of prosperity, to bank them for later use in times of adverse economic conditions.

I think by the end of this decade, we will have answered that challenge. Not far from here, only a block away, we are producing what Louisiana needs most—smart people. We are producing smart people who have skills that you and I do not have, that our parents never dreamed of, that my brothers and sisters never thought about and I currently do not understand. But they will be, without question, what propels us into the 21st century. And when you look back at that photograph of the footprint on the moon, and when you recognize that a panel like this comes down to listen, I want you to remember a second thought that is in fact political, for which I apologize to both of them, that is neither a Democratic nor Republican footprint, it is an American footprint that required the total and complete united force of this country to place as a symbol of superiority.

And when we look in the year 2000 at the economic report of this country, we either will find that your children attend the best schools in the world and leave their footprints collectively on the globe, or we will find that the future belongs to whomever does.

Thank you for coming.

The CHAIRMAN. We will invite our first panel to come up. Because so many people have been willing to participate in this hearing and because of time constraints, I am going to ask each witness to summarize his statement orally in two or three minutes. Each witness' full statement will be printed in its entirety in the record of the hearing.

I now want to call our first panel today; that is Dr. Edward Murray, Professor of McNeese State University and Dr. Robert Twilley, Professor right here at the University of Southwestern Louisiana.

Dr. Murray, why do you not please begin.

[Prepared statement of Hon. Hayes follows:]

OPENING STATEMENT OF CONGRESSMAN JIMMY HAYES

Mr. Chairman, as I travel throughout southwestern Louisiana I am constantly faced by families and individuals who express similar concerns to me each time we talk about our future. People are worried that the environment in which their children are growing up is polluted. They are concerned that the members of their families who have moved away to find jobs will stay away because the bayous, wetlands, and oil patch of this state no longer provide opportunities for couples to settle down and raise a family. And they are concerned that no one cares; that no one is really at the helm, making the tough decisions and identifying the resources that need our attention. However, I want to state that meetings such as the one here today do lead to real solutions to those legitimate fears.

Chairman Anderson, the nuts-and-bolts of this area's economy and environment all fall under the jurisdiction and venue of your committee. Therefore, we have the ability and the mission statement within this body to set policies that will reflect the vital role that public facilities—such as highways, ports, airports, water supplies and waste water treatment facilities—all play in our quality of life. Subsequently, it is our charge to listen to the needs of these people, to see first-hand the problems that they confront, and to then provide the necessary leadership to deliver those programs or projects that will solve those problems.

And the need for such leadership at the federal level is critical. As with many other states, the decade of the eighties brought with it a legacy of debt to Louisiana. Unfortunately, that fact was also coupled with a legacy of ignored priorities. For example, 45% of my state's bridges are either structurally deficient or functionally obsolete, which means that every other bridge we cross is inadequate or unsafe for our families to use. I wonder how long it would take us to go from Sulphur to Henderson these days if we needed an airboat to cross every other bayou lying between the two towns. Or more importantly, how many lives are we jeopardizing each day on the way to our offices or schools by our inattention to the roads and bridges beneath our feet.

Furthermore, the E.P.A. has estimated that the capital costs needed to build enough wastewater treatment plants in the state is nearly $1.2 BILLION; a figure so large that it equals the total earnings of the entire population of Calcasieu and Cameron Parishes for one year, alone. At a time when we have come to understand how vital freshwater is to our lives and jobs, it is imperative that we do not pollute these resources in the first place. Clearly, we can not continue to jeopardize our families by ignoring our responsibility to provide them with a clean environment and roads and water supplies that support good jobs.

Yet I must point out that I am concerned that all these needs for roads, bridges, sewers, airports and ports come at a time when the government seems to be abandoning us. Since 1980: (1) federal programs for funding infrastructure in rural America have been cut by over 67%; (2) over 60% of the funding for secondary highway systems has been eliminated; (3) FmHA's water and wastewater grants have been reduced by 75%; (4) E.P.A.'s construction grants have been cut by 75%; and (5) Community Development Block Grants have suffered cuts of nearly 33%.

While I can point to statistical estimates that will calculate the dollar-for-dollar return on each project we propose for towns like Kinder, Maurice or Vinton, I believe the critical need for improved roads and sewers will be obscured by an overemphasis on dollars-and-cents. Consequently, I am sure that the testimony of the following panelists will reveal much more effectively the "real" impact such investments have within these communities.

The members of the panels assembled today will illustrate the problems small to mid-sized communities have in providing a clean environment as well as in attracting businesses that bring in jobs in manufacturing, service industries, or processing, when they can not provide good roads, available air transportation, adequate water supplies or other essential items. In short, they will explain how public works provides not only a clean environment, but an economic base that is essential to the security of our jobs in the future.

Mr. Chairman, I represent a state that is fighting to pick itself up by the bootstraps. We have come to realize that selling the environment doesn't guarantee jobs or prosperity. Furthermore, we have recognized that only a complete commitment to the improvement of our region, from the sewers on up, will allow us to be successful in making this area a place where young couples will continue to want to raise their families. Consequently, what you need to hear today, and must take back with you to Washington tomorrow, is an understanding of the partnership we need to develop with the federal government to provide clean air, clean water and substantive jobs for the people of this region.

We have put our own money where our mouths are to address these problems and are not asking for a simple hand-out. Nonetheless, we recognize that we can not go it alone; we simply do not have the state resources to complete our own list of critical needs. Therefore, we are looking for ways to work hand-in-hand with the federal government to complete the list.

Mr. Chairman, I trust that the comments you will hear today will help you better understand our commitment to not only protecting our unique environment, but to bringing home the jobs that our people desperately want and deserve and I appreciate your coming to Lafayette to hear them first-hand.

TESTIMONY OF DR. H. EDWARD MURRAY, PROFESSOR, McNEESE STATE UNIVERSITY, LAKE CHARLES, LA AND DR. ROBERT R. TWILLEY, PROFESSOR, UNIVERSITY OF SOUTHWESTERN LOUISIANA, LAFAYETTE, LA

Dr. MURRAY. Thank you, Mr. Chairman, members of the Committee. I am Dr. Edward Murray, Director of Research Services and sponsored programs at McNeese State University in Lake Charles, Louisiana.

What I want to present to you today is a rather unique idea. The economic growth and development of the State of Louisiana is highly dependent upon the quality of its air and water, not only for its residents, but for retention and expansion of existing businesses and attraction of new viable industry. The goal of providing more and better job opportunities has long been an activity of enterprising communities.

Experience has shown that most successful programs are the result of dedicated local leadership and supportive citizens. State colleges and universities play a vital role in the leadership of the community. Many of the new jobs in this region will be created through growth of existing firms. In order to facilitate that growth, businesses must be assured of receiving adequate information for addressing environmental concerns.

Petrochemical industries constitute a significant portion of the industrial base of the State of Louisiana. These industries have a profound impact on the standard of living that is enjoyed by the thousands of employees that represent their work force.

Louisiana, particularly southwestern Louisiana, has long been known to have a high cancer rate. Citizens are apprehensive of public and industrial sources of pollution. Established research centers would address these concerns through data acquisition and field research aimed at obtaining results that will be used to solve regional and national problems. Local or regional universities generally have local support and public trust. These universities would serve as monitors for local environmental problems in contrast to a major university out of or across the state, for which public trust is not vested.

The impact resulting from injection wells, hazardous waste, effluents from public and industrial sources, air and ground water pollution are examples of pollution that concern the citizens of Louisiana. Research projects should be directed toward describing, quantifying, modeling and suggesting remediation for problem areas discovered through investigations.

Establishment of centers for environmental studies would provide pure and applied research involving environmental pollution. Results of these studies would be made available to local citizens groups, area industries, and parish, state and federal agencies. The centers would provide information in areas involving contaminant hydrogeology, ambient air quality, environmental monitoring, collection and collating of new and existing data, and education of the general public.

The centers would work toward coordinating research efforts with regulatory agencies of the state and federal government, local and private agencies and other state universities. Interfaces with appropriate data banks and agencies would be developed to exchange, consolidate, correlate and summarize available data. State-of-the-art information would be provided through state and local news media, workshops, seminars and public forums.

Public trust in local universities should be an important consideration when establishing regional research centers. The success of McNeese State University in two large environmental studies demonstrates the wisdom of utilizing the talents provided by regional universities.

The CHAIRMAN. Dr. Twilley.

[The prepared statement of Dr. Murray appears on p. 809.]

Dr. TWILLEY. Thank you, Chairman, Congressmen Hayes and Geren.

The natural resources of Louisiana represent one of the most productive wetland and economic resources in the United States. The statistics are staggering—in the lower 48 states, Louisiana has 40 percent of the total coastal vegetation, the lower Mississippi River valley has one of the largest bottomland hardwood forests and swamps in the entire United States, the wetlands in Louisiana regularly winter over two-thirds of the Mississippi Flyway's waterfowl population, including 20 to 25 percent of the North America puddle duck population. One of the statistics that we use is that Calcasieu actually houses more water fowl than the entire Atlantic Flyway. These resources are being lost at an alarming rate. Present estimates are that coastal vegetation in the United States—or in the State of Louisiana—is being eroded at an estimate of 40 to 50 square miles per year, or an area that is just about equivalent to the size of this auditorium, per hour. In addition, only 20 percent of the original 24 million hectares of the Bowman Howard Forest and Swamps of the lower Mississippi River Valley remain today. Thus the focus of national attention is deserving to a region that historically received insufficient funding for the management of immense environmental problems. The development of infrastructure for the enhancement of transportation in Louisiana has to consider the importance of wetland ecosystems to the cultural, economic and ecological resources of our state. One of the most important considerations is alternation in local and regional hydrology that controls the structure and function of both forested wetland and marsh habitats. The frequency and duration of flooding determines the distribution, density and growth of plant and animal species in wetlands. These species have specific morphological and physiological mechanisms that provide adaptations to environmental constraints established by hydrologic conditions. These structural characteristics of wetland communities are also influenced by the conditions of fertility established by the flow of water that contribute sediment and nutrients.

Wetlands perform many important functions in local and regional watersheds, such as providing food and habitat for fish and wildlife, stabilizing shorelines and controlling erosion, and abating water quality problems by removing pollutants. These functions are dependent on the structure of wetlands and particularly the flow of water. I would like to make a very important point in this area of the testimony in emphasizing that both the structure and function of wetlands are determined by the hydrologic characteristics of a region. One of the most important statements that I can make is that in the past 20 years of research on wetlands, hydrology has been established as the key environmental parameter that controls the nature of wetland ecosystems.

Public work and transportation projects must consider and evaluate the potential change in structure and function of wetland communities associated with these alterations in hydrology. Consideration should also be given to modifications of existing infrastructure that have attributed to the tremendous loss of wetland habitats in Louisiana. Here in Louisiana there is an excellent opportunity for ecologist and engineers to work together to develop public works and transportation projects that interface the transportation needs of our society with the value of wetland ecosystems. This perspective has to include not only alterations from a local or state level but also modifications of regional proportion that uncouple important linkages among riverine, wetland and coastal ecosystems.

Public work projects may also benefit from the ecological functions of wetlands that provide free services to local and regional economies. Wetland influence water quality of rivers and coastal environments by either serving as a source or sink of nutrients. Many primary pollutants, such as nitrogen and phosphorus that contribute to the eutrophication of rivers and streams, are utilized by wetlands for increased growth. Thus enhanced growth increases the habitat and food value of wetlands, providing a positive feedback to aquatic organisms.

Thus the function of wetlands as a nutrient sink has resulted in the design of these natural resources for the tertiary treatment of wastewater released from small municipalities. Although there are several pilot projects that exist, such as a study here at USL with the City of Thibodaux, much more research and development is needed to improve the efficiency of these ecologically engineered resources. Given the wetland resources and economic base of many small municipalities in Louisiana, along with a very suitable climate, there is great potential for the development of wetland/wastewater ecosystems. Public work projects through grants to cities in Louisiana should encourage these wastewater recycling projects.

In summary, I would like for this Committee to realize the significance of its projects to the protection and utilization of wetland resources in the State of Louisiana. This is not only associated with those public work and transportation activities within our own state, but also those in the entire watershed of the Mississippi region. The coastal ocean productivity of Louisiana depends on important linkages among riverine, wetland and coastal watersheds of the entire Mississippi River basin. Engineering projects must consider the ecological significance of these natural wetland resources in the design of infrastructure. In addition, projects of public works should consider the utility of the free services that are provided by the function of wetlands, particularly in the design of tertiary wastewater facilities.

Thank you for this opportunity to discuss or explain some of the importance of wetland resources and I hope you have the opportunity or occasion to see some of our unique resources during our visit. Thank you.

[The prepared statement of Dr. Twilley appears on p. 820.]

The CHAIRMAN. Thank you, Doctor. Now we will have some questions.

Dr. Murray, given your expertise, can you tell us what new technologies exist or might be under development to help meet infrastructure needs?

Dr. MURRAY. In the particular area that I presented here? I think that many of the state agencies are beginning to rely more heavily on state institutions. In fact, we just completed a project where we brought together several state agencies where we were able to communicate in one room, which is kind of unusual with that many agencies—this was including DEQ, EPA, USGS, several other agencies. I think that trying to promote this communication between agencies goes a long way in trying to do what we have proposed.

The CHAIRMAN. Professor Twilley, how do we ensure the proper balance between growth and development on the one hand, and preserving wetland values on the other hand?

Dr. TWILLEY. That is a good question and I think that that is the task we have before us, because as I stated before, we really have begun to understand what these functions are of wetlands only in the last 20 years. I think that is very important to consider, that historically ecology was split between aquatic science and terrestrial science. We studied water and we studied the land. Wetlands is brand new, it is an interface. And so as a science, it is a very recent understanding of those ecosystems.

I think that what we are beginning to understand is the function and free services that these wetlands provide to basic economies, that we before may not have associated with. And I think Louisiana again is a perfect example. Our fishery productivity and the economics of our state related to that enterprise is linked tightly to our wetlands. And so that we have to develop an understanding and appreciate those free services and functions.

Now how do we interface that, as you have asked? We have to look at it from a perspective of engineering designs that take into account ecological significance of these systems and I think it is just basically in the very beginning in developing plans for infrastructure that that consideration is taken into account. I am not asking or proposing to this Committee that any infrastructure should not be pursued. I think the most important thing is to take into account that engineering designs consider these important ecological functions and pursue that line rather than purely from an engineering perspective or purely from an environmental perspective with no infrastructure at all. There has to be a combination of both and a consideration of both needs. The key word is ecological engineering.

The CHAIRMAN. Thank you. Congressman Jimmy Hayes.

Mr. HAYES. You have led into an opportunity to thank both the gentlemen on my left and on my right. Your phrase is almost precisely what this gentleman is responsible for including in a bill two Wednesdays ago referring to the Corps of Engineers as the environmental engineers in a markup at which time we were able to visit with Congressman Anderson about our unique problems in Louisiana. He was most attentive to us and with the work of his excellent staff we were able to put in language which suggests a new path for the Corps of Engineers and would suggest for the first time that as environmental engineers they are able to take the spoil and they are able to take the work from dredging and use that to save wetlands, to so in an environmentally sound manner but for the first time ever to realize that it is also part of the role of the Corps of Engineers to preserve and protect wetlands as well as to open corridors of commerce. This gives us a chance through the permitting process, not around it, to allow some areas in Calcasieu Parish, for example, where we have got Calcasieu River dredging, to benefit immediately through the saving of as many acres as we can of wetlands toward lowering that horrendous figure of 50 square miles a year. And that language would not exist if it were not for Glenn Anderson of California being Chairman of the Public Works and Transportation Committee in the House of Representatives, and Senator John Breaux protecting it across the aisle, where quite often we face threats and disasters in that direction.

In addition to which, in very specific form, it was the same bill two Wednesdays ago that Congressman Anderson allowed us to put in the project down on the Calcasieu River, Hackberry, which is very important, as you know, to so many individuals impacted by it and also the Vermilion Parish freshwater bayou project. This is why I have him down here, he gets to see firsthand the kind of problems that we have been asking his assistance on, we get to thank him for specific projects, but the greatest thanks we owe him is an additional direction to the Army Corps of Engineers that for the next decade we can work in accomplish precisely what you are saying.

My question to each of you is very simple, it involves the two universities rather than one. You are very fortunate to have a personal relationship with both of your presidents; Dr. Abear and Dr.

Automeau, and from my perspective it is more of a suggestion than question that based upon that personal friendship you also have a marriage of talents in the universities. Nobody knows more about water quality than McNeese, not necessarily for the best of reasons in that it had to deal with so many problems in the Calcasieu River at a time of environmental concern, but nobody has the ability to reach back into collected data for so long a period of time to be able to address the kind of things that you are concerned about.

USL has made some remarkable strides in fields of engineering that were not dreamed of. I would suggest that there is a wonderful word to tie the two of you together, the biotech advent in the decade that is coming ahead, allows these two universities through that kind of marriage to take the collected data, transform it and then to do things with it that are heretofore unheard of, especially in cancer research. Not only just water quality, but how to dissect that water quality and how possibly to even impact upon the case and effect relationship of our injection wells and pollution to the disease itself. If there is found a cure for AIDS, which all of us pray there will be, it will be found because of biotech research, it will be found because of the incredible ability now to split into its component parts the complexities of even genetic engineering. And I think the basis for water quality study, wetlands study and the ability of these two universities to put their resources together is unparalleled.

Needless to say, you can count upon our office doing anything whatsoever to further your individual and your collective efforts, but collective efforts are virtually unstoppable in the Congress and I would ask both of you to take that message home to your university presidents, tell them our hand is there, and use their personal relationship to forge the kind of union we need to go forward with positive and concrete results.

Thanks.

The CHAIRMAN. Congressman Pete Geren.

Mr. GEREN. Thank you, Mr. Chairman. I would just like to address a question to both of our panelists.

The challenges and the problems that you laid out are not simple ones, they are not ones that the general public probably has a very good grasp of, and in addition to many of the experiences your state and my state share in common, we also share some attitudes in common and one of those attitudes has been—I do not think you could generously call it an insensitivity to the kind of issues that you have discussed today, probably an insensitivity growing out of lack of information or lack of knowledge about the seriousness of the problem.

As we move forward as a committee with our commitment to try to energize the resources of the country and the people of this country to make an investment in infrastructure and make an investment in infrastructure that also takes into consideration the environmental factors that you all have done such a good job of describing, we—the first step in that process is getting the people of this country interested in it, aware of the problems and a part of the solution to the problems. The area that each of you has described is one where I think that task will be very hard because it takes somebody of your expertise to really understand the complexities of it.

Do you see in your state—I guess I am asking for some advice—how do we begin the education process so as our state agencies, as our federal agencies move ahead with this infrastructure development, we do make sure that the needs of the environment are taken into consideration and where our efforts can be complemented by what environment has to offer, how we can make sure that that happens. I am just concerned that we do not have, particularly in our part of the world, a public out there that understands the importance of what you all have told us today. How do we begin that education process?

Dr. MURRAY. Well various state agencies certainly are aware that this is a problem. Our own local Department of Environmental Quality and in Texas I am not sure what agency that is, what it is called there, but there are similar agencies—and in many cases these regulatory agencies take some pretty hard raps from the public, and in many cases they reach a point where people simply do not have trust in them any more. That does not happen all the time, but it does happen. There seems to be a lack of communication between a lot of these agencies and the general public. Rules are made, people are to accept them, and sometimes really not understanding why. I think that an example of this would be the Calcasieu Estuary and some of the problems that we have had over there. People have been told they cannot fish there, they cannot eat the fish and this is the reason why, but they do not really understand it.

I think the time has really come where these various state agencies must work with the universities and possibly even into the public school system, to get the message out to the people so that it becomes part of the education process and not just some big brother telling the public this is the way it is going to have to be. We have to incorporate it into our education process, and it is nothing that can be done overnight. It is something that we have to strive for for the future, we have to develop the communication between our state agencies and federal agencies to try to get to the people.

Dr. TWILLEY. I have one point to make concerning that that I think is very important, and that is that the research and development and understanding problems associated with water quality and wetlands, I think the university has played historically a very important role in developing both that expertise and also the personnel now, or what I call the practitioners, which are now working in state and federal agencies, to actually implement many of the programs that have been coming through Congress as far as the wetland restoration program. And that is very important because, again, if you go back to the timetable of the development of this expertise, it is only in the last two decades. And I think what is very important to consider is that as new programs are coming through Congress or even through state legislatures, they are asking for state or federal governments to implement many of these coastal restorations and many of these other programs, that we have to keep in mind that we still are in much need of R&D concerning the progress of our understanding of these systems and how we can develop these implementation projects that have been designed.

I view many of the state and federal agencies and the people working in those agencies as practitioners of our knowledge. They are like the physicians in medical science. They are the ones that are actually taking that information. And if you think about it and look at our information base in understanding wetland systems or ecology in general, I think we are about like in the mid-1800s in medical science. And you are asking federal agencies to do things as if you were asking someone in medical science in the mid-1800s to give me a cure for cancer. You are pushing and asking, I think, a lot more of what our information base can provide. That is very important. And I think that because of that we have to view the role of the universities in still providing the R&D to help with the implementation of your programs.

I am worried that that is not going on right now, and, of course, that is sour grapes from the university coming in here asking for more research funds, but I still think that you have to consider in Congress how you are pushing the state of the art of our understanding of certain programs when you are implementing them or asking them to be implemented based upon our information and knowledge. That is a very important point.

Mr. Geren. Thank you very much.

The Chairman. Thank you, Dr. Edward Murray and Dr. Robert Twilley.

Our next panel today consists of Mr. Bill Berry, Louisiana Land and Exploration Company——

Mr. Hayes. LL&E—that is easier, he understands LL&E.

The Chairman. LL&E, okay. Mr. Vernon Meyer of Vernon Meyer and Associates and Mr. Curt Hoglan of the Lafayette Economic Development Agency.

Our first witness is Bill Berry, Louisiana Land and Exploration, New Orleans, Louisiana—that is what it says here. Is that pretty close?

Mr. Berry. That is pretty close, yes.

The Chairman. Very good.

TESTIMONY OF W.L. BERRY, DIRECTOR, ENVIRONMENTAL AFFAIRS & SAFETY, LOUISIANA LAND & EXPLORATION COMPANY, NEW ORLEANS, LA; VERNON F. MEYER, VERNON MEYER & ASSOCIATES, SULPHUR, LA; AND CURTIS F. HOGLAN, LAFAYETTE ECONOMIC DEVELOPMENT AGENCY, LAFAYETTE, LA

Mr. Berry. Thank you, Mr. Chairman, members of the Committee, I am Bill Berry, Director, Environmental Affairs & Safety for the Louisiana Land & Exploration Company.

LL&E is the largest private owner of coastal wetlands in the United States. As a large property owner, we are pleased to appear here today and discuss infrastructure problems in the State of Louisiana, particularly in wetlands area. While our comments are based on our experiences and observations as an owner of coastal wetlands, they are certainly applicable to infrastructure situations throughout the state.

The present section 404 permitting situation has a potential to practically stifle all development within Louisiana's wetlands, infrastructure and otherwise. In the time available, I would like to focus on one problem area—that of definition of a wetland that must be protected under the 404 program.

We have no objection to the basic statutory definition which states that lands should be classified as wetlands if three indicative characteristics are present: hydrology, hydrophytic vegetation and hydric soils. There appears to be general agreement among experts that these three factors are the primary scientific indicators of wetlands.

However, over the past year, there have been numerous instances in which lands not previously believed to meet the federal criteria for wetlands have been so determined to fall within the statutory definition. This is a result of the application of the federal manual for identifying and delineating jurisdictional wetlands, which was adopted on January 10, 1989.

Although the effect of the delineation manual is not yet fully understood, some potentially troublesome consequences are already evident. Areas that have not traditionally been viewed as wetlands, such as prior converted farmlands, elevated hillsides and hardwood forests, are falling within the wetlands definition. Jurisdiction is being extended over lands that lack the ecological characteristics of wetlands and may therefore be outside the scope of lands that require protection in the interest of wetlands protection.

Problems have also arisen as a result of the diminishing use of two of the three major indicators, hydrology and hydrophytic vegetation, in delineating wetlands. The Louisiana Farm Bureau Federation estimates that of the 4.8 million acres of agricultural lands now classified as wetlands in Louisiana, approximately 4.3 million acres have been delineated as wetlands solely on the basis of soil type and as a direct result of the delineation manual. By failing to delineate wetlands by all three criteria, agencies have broadened the sweep of federal regulatory programs far beyond that contained in the statutory definition of wetlands.

For example, approximately 14.6 million acres, or 53 percent, of the Louisiana land area consists of hydric soils which are presently being treated as wetlands. And if you would turn your attention to the poster over to the left of the podium, these are the entire areas shown in gray on the poster, wetlands are checkerboarded throughout the blue areas and the remainder of the state is not wetlands free. For example, in the large area marked "1", all of the soil in red on the second poster is hydric and therefore classified as wetlands. The situation is similar across the country. In California, there are nearly three million acres of hydric soils and in Texas about 15 million acres.

As long as the current practices under the manual govern the delineation process, the general statutory definition will continue to be applied to categories of lands that do not possess typical wetlands characteristics and values. While some environmental regulation of these land resources may be appropriate for other conservation purposes, lands that do not meet the full measure of the criteria for wetlands delineation should not be regulated under a wetlands management regime. This includes infrastructure and all other development projects.

Time will not permit a discussion of the other wetlands issues of concern for all types of development, infrastructure and otherwise, that must be addressed. These are: the goal of no net loss of wetlands and strict sequencing. However, these are also of great importance.

Thank you very much.

The CHAIRMAN. Mr. Meyer, you are number two here—Mr. Vernon Meyer.

[The prepared statement of Mr. Berry appears on p. 794.]

Mr. MEYER. Thank you, Mr. Chairman, Congressman Hayes, Congressman Geren, I appreciate the privilege of attending this conference. I am Vernon Meyer, President of Meyer and Associates, Consulting Engineers, Sulphur, Louisiana. I have the privilege of representing many towns in southwest Louisiana, and ports.

Presently southwest Louisiana villages, towns, cities and parishes are facing the same infrastructure need problems as found in most communities and counties throughout the United States. The average annual rainfall of 60 inches per year has probably created more problems associated with the wastewater systems and roads than are found in most areas of the United States. The soils of southwest Louisiana are not the best suited for construction of roadways and utility systems, thereby requiring increased costs for their respective development.

One of the most critical needs facing the public utilities today are rehabilitation and/or replacement of wastewater collection systems. Most systems that are aged from 20 to 100 years old have serious structural needs or deteriorated joint conditions. With the rainfall in Louisiana, this condition has caused abnormal amount of inflow and infiltration into the wastewater system and roadway failures above the lines. To transport, pump and treat the added wastewater flow makes the situation expensive for public utilities. All wastewater systems are presently being mandated or going to be mandated by EPA to upgrade their treatment which is needed to improve our environmental conditions, but it is also adding an increased financial burden on the consumer.

The solution for funding these deficiencies in the infrastructure for public utilities and roads needs to be addressed now, in the same manner and magnitude as Congress did in 1972, addressing the wastewater program.

The recent adoption of the new Wetlands Mitigation Policy by the Army Corps of Engineers and U.S. Environmental Protection Agency will have a significant effect on future expansion projects for all Gulf ports including the Port of Lake Charles. In Calcasieu Parish, most of the larger undeveloped property tracts located adjacent to deep water (Calcasieu Ship Channel) can be classified as wetlands or partially wetlands. Thus as the Port develops new waterfront property, it will inevitably be faced with the task of minimizing any detrimental effects on wetlands or possibly compensatory mitigation. The net result is that property development costs including the associated technical cost will be significantly higher.

Another problem that Port authorities must deal with is dredged material disposal areas. As existing spoil disposal areas are filled, new disposal areas must be found. Again, most large undeveloped property tracts located adjacent to deep water can be classified as wetlands. The Corps of Engineers is currently performing a study of the remaining life span of existing dredged material disposal areas along the Calcasieu Ship Channel. It is possible that in the near future, the Port will be faced with disposing of at least a portion of its dredged materials at sea. Trade development should also be considered in a possible solution of the new Wetlands Mitigation Policy.

I want to thank you for the honor of being able to appear before this committee to express brief comments in regard to our infrastructure needs of Louisiana and expansion capabilities of ports along the Gulf coast, and more specifically the Lake Charles Harbor & Terminal District Port's expansion efforts.

Thank you, gentlemen.

The CHAIRMAN. Thank you, Mr. Meyer.

Our next witness will be Mr. Curt Hoglan of the Lafayette Economic Development Agency.

[The prepared statement of Mr. Meyer appears on p. 806.]

Mr. HOGLAN. Mr. Chairman, I am Curt Hoglan, President and CEO of the Lafayette Economic Development Authority, and I appreciate the opportunity to relate to you and the Committee, from an economic development perspective what I believe to be the primary challenges and needs of our area in terms of physical infrastructure.

Time does not permit me to go into the many specific details, but I want to highlight the areas that I believe need the most attention. There are many things in this regard that we can do for ourselves at the local level, and we are trying to do that.

But I will enumerate those areas that I believe your committee can impact and where action at your level is needed and appropriate. In the State of Louisiana, further development of our ports is crucial to our economic recovery and our participation in the global economy. The economic implications of our location on the Gulf of Mexico and our proximity to Central and South America and access to more distant markets, make this a priority for us.

We need unobstructed navigation channels from several of our ports to the Gulf. We need dredging and increased maintenance of portions of the intracoastal waterway and access lanes to the Gulf. In some cases new, higher and wider bridges are needed to accommodate traffic of larger vessels, particularly offshore platforms and other large structures.

Our industry involved in these projects in many instances are unique to this area and are now limited in bidding and receiving needed work because of their inability to receive and discharge this very large cargo.

We continue to witness the demise of rail lines in this country. It is particularly true for short lines, often connecting the smaller towns and rail users to the main lines. This greatly hurts the economic growth in small towns, many of which are not located on interstate highways. We are currently trying to save 20 miles of track in the local area that the railroad company has announced it will abandon and sell for salvage. We are stymied in our efforts due to no funds available to buy it, refurbish it and operate it. Although current rail customers on this segment are insufficient to make the line economically successful, we need to preserve it for future economic growth. Once the steel is removed and the right-of-way is returned to landowners, I believe it is gone forever. The cost of building it over from scratch will be certainly prohibitive. We need funding to assist in saving these lines, also some tax or other incentives would help attract short line rail operators in operating over these lines.

I will not comment in any detail on this next item because I do not know enough about the details of what is needed or how it can be done, and I know the Committee, I think in the next panel, is going to hear from people far more expert in this area. But from my perspective, our airports are also absolutely crucial to the economy and need massive improvements to keep up with technological advances, increased demands and other requirements.

As I am sure you are finding out in other states, the difficulty in extending water, sewer and access roads, hinders our efforts to attract new industry and assist expanding industry. The provision of water and sewer to industry is a particularly difficult problem for smaller municipalities that do not have a large tax base to support this rather expensive endeavor, especially if it involves increasing capacity as well as providing water and sewer line extensions.

Louisiana is trying to improve our highways with our new transportation trust fund, but we ask your continued support of federal programs to assist in these areas. We specifically ask your continued support of the Economic Development Administration which greatly assists in providing matching funds for these kinds of infrastructure improvements.

Mr. Chairman, it may be a little off base to ask for your support of the extension of tax-exempt industrial development bond financing for manufacturing facilities, but I am going to do it anyway. Perhaps your Committee has nothing to do with it, but I do believe it is within the purview of the Ways and Means Committee, but perhaps you could relate to Representative Rostenkowski and his troops, just how critical the extension of this provision is. As you know, the sun sets on this issue the end of September and if it is not extended, it will be a devastating blow to financing of many, many industrial projects in this nation and in Lafayette, Louisiana.

Both of Louisiana's U.S. Senators have signed on as co-sponsors of a Senate bill to extend it, and we are proud to say Congressman Jimmy Hayes has joined almost all other Louisiana Representatives—I should say led, since he was the first to sign—as a co-sponsor to Representative Flippo's House bill to extend tax exempt industrial bond financing indefinitely.

The relationship of this legislation to infrastructure may appear to be rather remote and not so obvious, but there certainly is a relationship—indeed a partnership in helping to create jobs, generating money for the tax base and economic growth.

Mr. Chairman, I appreciate being able to talk with you and the Committee today, and I appreciate your demonstrated concern manifested by your presence here today. Thank you for coming, and welcome to Louisiana.

The **Chairman**. Thank you, Curt Hoglan. I would hope that you might be aware that I have been in support of tax-exempt bonds in the past.

I do have a question that some of you already answered a little bit, but I want to direct this question to each of you. What are the most critical capital investment needs for your area of the state? Do you want to start, Bill, being the first speaker? I know, Mr. Meyer, you almost answered that with yours.

Mr. **Berry**. You say what are the most critical capital——

The **Chairman**. Critical capital investment needs for your area.

Mr. **Berry**. Of course, I am from New Orleans, Louisiana, and if we are looking at the infrastructure problem, I think probably the infrastructure we have a lot of problem with is the hurricane protection system, I would say. Certain hurricane protection is a very capital intensive type of an expenditure. I think that is probably our most pressing need probably right now in the New Orleans area, particularly with the storm in the Gulf right now—hopefully it is going to miss all of us.

The **Chairman**. Mr. Meyer.

Mr. **Meyer**. Thank you, Mr. Chairman. I would say in reference to communities, it is probably the wastewater systems; in reference to parishes, I would have to say bridges and roads. I know the Federal Government is dwelling on bridges, but at the current pace, it will be three or four hundred years before they get them all addressed. But I would say these are the two most critical areas from government standpoint.

The **Chairman**. Mr. Hoglan.

Mr. **Hoglan**. I will not comment on what I think our greatest need is because it is a better system for education and training of the work force, but that is not primarily the area of this committee, or the lack of reasonably available capital for financing industrial development projects. But from a physical infrastructure standpoint, I would say the extension and building of more capacity, particularly in the smaller municipalities for water, sewer and roads, and closely tied to that, ports development.

The **Chairman**. Congressman Jimmy Hayes.

Mr. **Hayes**. Well for the last two years, Bill and I have been working very hard on wetlands legislation. Let me first comment on something that you brought up. At the meeting I believe last Thursday it was with Chief of Staff to the President John Sununu, on the definition in the manual of wetlands, which is the source of the problems you demonstrated on the charts, it was clear to me—he had agency heads there—it was clear to me that what has happened is we have taken a valid scientific definition that you cannot dispute if you look at it solely in terms of the expertise that generated it as a definitional matter, but we have imposed it in legislation coming from 1972 in the Clean Water Act, that has nothing to do with scientific definition, but was intended to be a statement of public policy. In other words, it was saying that the people of America wanted the beautiful wetlands in Rockefeller Preserve and wanted Cameron Parish and Vermilion Parish and the Atchafalaya Basin to be preserved and protected.

Unfortunately the scientific definition ends up including the airport in Monroe, which as a matter of public policy may be important, but I do not think was the policy enunciated by the people in this country and I do not think that they intended to see confiscation in effect of private ownership of farmland that was not their vision of what they thought was genuine—in their terms, genuine—not scientifically but emotionally genuine wetlands with cypress knees, with water, with movement in the estuary system. And we had a sunbelt caucus meeting with several environmental groups, some of which—it is not fair to say all, but some of which, particularly the Audubon Society, saying that the three definitional test was intended to be employed and that the single criteria of only one, for example soil content, was intended to be used only in extreme cases where protecting something that was crucial to public need and awareness had to be reached in that manner. And that the scientific definition that was employed was not inaccurate but made a different statement of public policy. Sixty percent of Louisiana cannot be shut down and have the state survive. Almost 80 percent of Harris County, all of New Orleans, all of Houston, cannot have one stick that is moved without permitting and not one bit of construction. That was not public policy.

And I think the Chief of Staff, Mr. Sununu, for the first time, got to hear some of us in the sunbelt who were saying ordinarily you have developers who are taking something, and environmentalists who are stopping them. That is the scenario. The television plot would be someone is building a shopping center in a magnificent oak tree stand or someone is knocking down cypress trees in order to put in a drive-in fast food place. But in Louisiana, the enemy is not a developer doing that, in most instances. The enemy is erosion and the enemy is some of our previous canals that have been cut without correct locks, without a correct water flow, and we are losing 50 square miles a year, not to Donald Trump, we are losing 50 square miles a year to the impact of those problems. And doing nothing is the wrong environmental position. Doing nothing is the position that the Wildlife Federation cannot tolerate, but we need to have them know it more, because they are used to a different kind of confrontation.

So the question that I want to ask all of you is, what is the best means of bridging landowners like LL&E, engineering firms, industrial development, quasi-public entities—what is the forum that is most useful to bring environmentalists, landowners, business concerns together so that we can have an opportunity to explain public policy in the terms in which I have just described it. What is the best way to give them the same room, same time, same place, and most effectively air their concerns and yours?

Mr. BERRY. Congressman, I think probably one good approach that is being pursued right now is this President's Inter-Agency Task Force on Wetlands. You know, they are having a series of hearings around the country and I think that is going to be a step in the right direction.

Mr. HAYES. Which they agreed to extend past December of this year.

Mr. BERRY. Right.

Mr. HAYES. And the coordinator, she used to work for the Treasury Secretary, she used to work for——

Mr. BERRY. Teresa Gorman?

Mr. HAYES. That is it. She attended the meeting and was present when the commitment was made by Mr. Sununu to extend that date in through—past December. So those opportunities are going to be—I am glad to hear you say that is a positive step.

Mr. BERRY. I think that is a very positive step and I think a lot of good information is going to come out, a lot of views are going to come out of those hearings, but I am personally confident that it is going to take action by the Congress as a follow-up to that, to get our wetlands rightfully protected the way they should be protected, but to allow economic development to take place in the country at the same time. I think it is going to take legislation that you gentlemen are going to have to work on to achieve that goal. But I think the hearings are a step in the right direction to start with.

Mr. HAYES. Curt.

Mr. HOGLAN. A good question and I appreciate the opportunity to comment on it. I think one local thing we have done here approaches a solution, Congressman Hayes. One, we have appointed several commissions and local task forces to deal with the issues and each time we were careful to appoint environmentalists and developers on the same task force. It is kind of interesting, you get a slightly different reaction when you make both parties part of the responsibility of coming up with a solution. You make one party responsible for coming up with a solution, the other party tends to want to criticize it. But put both of them on the task force, sort of rub their noses together.

I think it requires some give and take and I personally think it is going to take some compromise on both the hard core developers, if there are such a thing, and hard core environmentalists. By the way, I should announce that I am a development environmentalist—I am trying to look at both sides. I do not think that development and protecting the environment are mutually exclusive. I really do believe that they can co-exist. I think you can accomplish both. But neither side can have it all. And I think the way of getting them together is putting them on joint committees, joint commissions, joint task forces, as an approach to that.

Mr. HAYES. Well let me inject before I ask Vern to come in—people in our state are not different from people in any other state. By overwhelming numbers, the people in our state will tell you that they are willing to trade jobs for environmental improvement. The cancer rates that were referred to here earlier are a driving force. So are so many other changes that they have seen take place to the devastation of what was the natural beauty in south Louisiana.

For that reason, it is essential that environmental organizations reflect a consensus behind, if not unanimous, at least a vast majority of those concerns. The part that has been missing in the past, from my perspective—I get statements on national issues from the Sierra Club nationally and I think one of the things that we are going to start doing in the future is try to get statements from those organizations and their representatives within my own district because of some of the differences just announced. That does not mean that they may agree with anything I have just said, but I want to know what they think about that. But I want to know way more than agreeing or disagreeing. I want to know why. In other words, if Harold Sheffler thinks that idea A is a bad idea, he may be a member of a national organization that has taken a position, but I want to know his reason because he knows so much about the area in which we live. And that, it seems to me, is essential in order for us to try to have an impact on committee action, to explain our own area. And I think I would be most interested in any views written by any of the consensus of groups you put together, and also use this forum as an opportunity to say—and use my office as an opportunity—to say that I want the local chapters of national environmental organizations to make comments upon national legislation as well, and from the perspective of south Louisiana. Because we do have some unique problems and we are certainly—I can tell you this right now—we are not going to pass legislation that is not environmentally sound, because first of all it is indefensible morally I think, but secondly, it is overwhelmingly unpopular.

So it is critical that environmental organizations are part of anything that is part of the congressional solution which you mentioned earlier, because if they are not there, there is no legislation, there will be no legislation. And that process I think though has to start at home and move upward, and not Washington, DC environmental statements moving downward. We need to know what our home folks in the community think, and I very much appreciate your comment of bringing groups in. I would urge you to continue to do so, and also to please give us anything, written reports or consensus on those issues as we move along, and ask those—which we will do—the local chapters to comment in the same manner.

Vernon, I am sorry, I did not mean to cut you off.

Mr. **Meyer**. No problem. I think both groups or all three groups or how many groups is necessary, can work together as long as we do not have a no-ban policy, because too long we have probably ignored wetlands and ignored environmental concerns, and it has caused many of the problems that we are facing today, and that is why the wetlands policy is here. So I think we just need to work together.

In speaking to the loss of wetlands, I think—would hope the United States Congress in their wisdom, would pass some kind of legislation to help us fund restoration of our Gulf and along the coastline of Louisiana, because I think it is one of our—probably statewide is one of the most critical needs we have.

Mr. **Hayes**. Thanks very much.

The **Chairman**. Congressman Pete Geren.

Mr. **Geren**. Thank you, Mr. Chairman.

You touched on a wide range of subjects, which I think points up the range of subjects under the jurisdiction of this Committee and also the many areas that all of us have to work at if we are doing our job well.

Mr. Berry, you talked about the problem with identifying wetlands. I represent an area that most people would consider the prairie. We have since learned recently that we have got a lot of wetlands in Fort Worth, Texas, we were surprised to find out. And it is causing some real problems trying to sort out these definitions.

You mentioned hurricane protection, wastewater systems, roads—which is traditionally thought of as infrastructure—as a state and also as a country, do you believe that this area is making the investment in these infrastructure needs that are necessary in order to meet the challenges that your state faces, both now and in the foreseeable future?

Mr. **Berry**. I certainly think we are beginning to. I alluded to our transportation trust fund, which is a new major effort to put a lot of money specifically dedicated to that, and safeguards put in so the money cannot be used in a general fund or for any other specific purpose, got to be used for roads and highways. We are notoriously behind the power curve on roads and highways, so I think we are certainly beginning to try to make that investment.

I think locally—I speak for Lafayette Parish—I think the parish and the municipalities in the parish are very aggressive. I think most of Acadiana I could even speak for and say they are very aggressive pro-industry and pro-business and they are making as big an investment as they can considering the tax base we have. Down at the local level we suffer from the same problems you all do, there is just not a bottomless pit of money out there, as some people think.

I think the question is always "are you using it for the right thing". I think we are making the effort that we can, realizing this area was devastated, it was hit extremely hard when the price of oil went down. And I certainly believe that we are trying to—and we realize, Congressman, and it is a point well taken, that we are not sitting here asking for only a handout. A lot of this, perhaps most of it, we have got to do for ourselves, and I think we are certainly trying to do that.

The **Chairman**. Well I guess that gets to our next panel. Thank you very much, gentlemen.

I would like to call our next panel, I believe Mayor Robert Istre of Drowley and Ted Stockwell representing the Louisiana Department of Transportation and Development.

Mayor, would you like to start?

Mr. **Hayes**. This is John Breaux' hometown, I might say.

The **Chairman**. Yes, I understand. I was with John for—I was going to say almost 100 years, but he would not want me to say that—so a long time, I enjoyed him very much.

TESTIMONY OF HON. ROBERT ISTRE, MAYOR, TOWN OF CROWLEY, LA AND TED STOCKWELL, DIRECTOR, HIGHWAY PROGRAMS DIVISION, DEPARTMENT OF TRANSPORTATION AND DEVELOPMENT, BATON ROUGE, LA

Mayor **Istre**. I am happy to be with you this afternoon. I think that a lot of the items that I had to discuss with you here have possibly been covered, but I would like to briefly go over them again and then we can discuss them a little later on, sir, if you will.

One of the items that I have is access roads to industrial parks. Industrial parks have grown up over a period of years over some of the older routes that we have had and now we have I-10 and other routes that we now have that make it very difficult for vehicles to get to and from industrial parks and I think that providing funds to be able to build those access roads certainly would be very helpful to our areas.

A cleaner environment. Working with the air, water and land, as I heard Congressman Hayes mention a few minutes ago. Certainly that is another area that we need to work with industry in trying to clean up our environment and make the area here a lot better off for the citizens who live here, environmentally, and making certain that it is clean.

Making funds available for the building of water and wastewater treatment facilities. At present I know that in Crowley, we are undergoing some problems with this in being able to get the funds that are needed.

Making waterways capable of handling barge traffic to go out to the Gulf and into ports that we may have here. I know that, for example, in our community, the widening and the dredging of Bayou Plaquemine Broule waterway, which I know has been on hold for some time, that would greatly improve the capabilities of handling more industry in our area. Also when this is done, this would allow water that is presently limited for irrigating of crops to be more plentiful, so it would help in more than one way by being able to see that these items are done.

I think that really covers the items that I have that I wanted to present to you today.

The CHAIRMAN. Mr. Stockwell.

Mr. STOCKWELL. Mr. Chairman, members of the Committee, I am here today to represent the Louisiana Department of Transportation and Development and will present our views relative to the state highway conditions in Louisiana.

There are 58,522 miles of public roads in Louisiana which include 16,622 miles in the state-maintained system, 32,118 miles in the parish-maintained system and 9,782 miles of city streets which are maintained by municipal governments. The state-maintained system is under the jurisdiction of the State Department of Transportation and Development and will be primarily addressed in this statement.

A highway needs assessment is conducted annually by our department on the entire state-maintained system of highways, as mandated by legislative act. Existing conditions having to do with the geometrics, the surface condition, the level and the classification of traffic, are defined for each roadway segment in the state system and these existing conditions are compared against acceptable standards to establish deficiencies.

Results from our latest study, which was completed in the spring of this year, indicate that 786 miles within the state system are in critical condition, 72 miles of these highways being on the interstate or other arterial system with the remainder on the rural collector system. An additional 1,658 miles are assessed to be in poor condition with 260 miles of interstate and other arterials falling within this category. The above-defined mileage, critical plus poor equaling 2,444 miles, are in a condition which requires reconstruction or rehabilitation now.

Additionally, our study indicates that there are 4,252 miles of highways in the state system that are in fair condition and are projected to require rehabilitation within the next five years. Assuming an average cost figure of $125,000 per mile for resurfacing or rehabilitation, eliminating the backlog of existing surface deficiencies and providing for elimination of projected deficiencies will cost approximately $837 million in the next five years.

Passage of the Transportation Trust Fund at the state level by the legislature and the electorate during 1989 will dedicate state gasoline and diesel excise taxes to operation of the DOTD and to capital outlay for transportation improvements. It is believed that we can expect funding of $80 million per year from the Trust Fund for surface rehabilitation of state highways. Assuming this figure, available state funds for rehabilitation will be $400 million during the next five years compared with $837 million in projected condition deficiencies.

When comparing existing volumes of traffic to design capacity on defined segments of our highway system, approximately 470 miles are shown to experience capacity problems. One hundred fifty two miles in this category are included for major widening in the TIME program, a state-funded program adopted in 1989 to improve selected highways within an intrastate network. Elimination of remaining known capacity problems after implementation of the TIME program is estimated to cost $575 million, not counting new mileage with capacity problems which will accrue each year. Practically all of this mileage is included in the federal aid primary system, a system for which we have received approximately $38 million each year for the last five years.

Shown in the table which I have presented to you are figures which indicate the current status of bridges on public roads in Louisiana. Just to give you a few of the figures, on the state system we have 7,806 bridges with 1,162 of them or 14.9 percent being structurally deficient and another 1,245 or 15.9 percent being functionally obsolete. On the off-state system, you have a total of 6,398 bridges with 39.2 percent being structurally deficient and 20.6 being functionally obsolete.

These figures indicate that there are 30.8 percent on the state system that are deficient, either structurally deficient or functionally obsolete. A total of 59.8 percent on the local systems are deficient in some way. Department engineers have estimated that $1.068 billion is needed to replace all bridges in Louisiana which qualify for replacement. For the past five years, Louisiana has received anywhere from $32 to $35 million per year in federal bridge replacement funds. Using the $35 million per year level, coupled with necessary state matching funds, which are 80 percent federal, 20 percent state, it will take approximately 24 years to replace bridges which are currently defined as deficient.

Completion of I-49 in the urbanized areas of Alexandria and Shreveport will mark the end of approved interstate projects in Louisiana. Emphasis in coming years will be in preservation of and capacity improvements to the existing highway system. New dedicated state funds and continued receipt of funds from the federal highway trust fund will allow us to construct many of these needed improvements.

Our state Transportation Department has provided input to and fully supports the position of AASHTO relative to the Surface Transportation Reauthorization legislation. This position was presented to the Surface Transportation Subcommittee of this Committee in March of this year by Mr. Kermit Justice, President of AASHTO, and others. In addition to emphasis on preservation and congestion relief on the existing system, we support the idea of highway user fees being dedicated solely to the funding of transportation improvements. People of this state voted last October 72 percent in favor of dedicating state gasoline and diesel taxes to transportation improvements. Our department also supports the two-component program, one being a categorical program focusing on meeting national requirements and the second being a flexible state and local program which will enable states and local governments to tailor transportation solutions to their unique needs.

I thank you for coming to Louisiana and allowing us and other citizens of the state to present our views.

[The prepared statement of Mr. Stockwell appears on p. 812.]

The CHAIRMAN. Thank you for inviting us.

Mayor Istre, how do you see the financial burden of addressing Louisiana's infrastructure needs being shared among the federal, the state and local governments?

Mayor ISTRE. Certainly it would be best that it be shared in three parts, but at present, the local government has been burdened with the majority of the costs of being able to accomplish this, and what we are hoping is that the federal and the state can come up with a little more than the local has to come up with at present. The local government has to probably come up with the majority of it now and if a little more could come from the federal and the state level, that would certainly be appreciated.

The CHAIRMAN. Sometimes each of them benefit, you know, and so if one of them always comes up with all of it, that is not too fair either.

Mayor ISTRE. If I may expand a little bit on that, as you know, the federal dollars really come from the local level and therefore are being sent to Washington and of course the state likewise being sent to the state capitol, and when local government can receive a little bit of the monies that are being sent up to the federal and to the state and that can go back home so that you can in turn benefit a little bit on the local level from the monies that you are paying into taxes on a national and state level, local people like to see that. And I know that at present, it seems that mandates are handed down from the federal and the state level and those mandates continue to come down on the local level where we have to come up with funds that we do not have in order to be able to finance things that we are forced to do or fund things that we are forced to do because of state laws and federal laws that are being mandated on local government and whenever mandates do come down, if the money would come down with them, that would certainly help, sir.

The CHAIRMAN. Mr. Stockwell, what actions has the State of Louisiana taken or proposed to assist the local governments with their critical road and bridge needs, to name two of them?

Mr. STOCKWELL. As has been previously mentioned on another panel, we passed a state trust fund back in the state during October of last year, the legislature passed it and then the people passed it by a large margin. Part of that—we would have 16 cents gasoline and diesel fuel tax, 16 cents per gallon, going to the operations of our department and also for improvements in the roads system. Guaranteed in that is one penny of that will be guaranteed to go to the parish governments for their parish road systems which would generate somewhere in the neighborhood of $23 million a year. Now in the current year, even though they are guaranteed one penny of that, in the current year in the legislature, appropriated in the past session, they have a total of $40 million going to the parish transportation fund.

Now the money coming from the federal government, the federal bridge replacement program, there is about 15 percent of that money, which this year we are getting in the neighborhood of about $32 million federal bridge replacement, about 15 percent of that is going for the replacement of parish bridges. So you have those two things that are going to the local governments at the present time.

The CHAIRMAN. Congressman Hayes.

Mr. HAYES. I am not really going to ask a question, but just let me do a bit of house-cleaning for a moment. I have several statements that have been added by different members of police jury—that, in order not to upset the Congressman from California, is not a law enforcement agency but is our equivalent of your county management system—all of those are going to be in the record along with Sawyer White and other groups that have asked to insert something. And let me also say that Mr. Chairman, the record is usually held open for what period of time for anyone who cares to do a written comment, either supplemental or in addition to anything presented today?

The CHAIRMAN. Roughly 30 days.

Mr. HAYES. Well then I would urge, if anyone wishes to contact our local office here or in Lake Charles or direct to the Washington office, we will be more than happy to see that any statements from any organizations, any governmental bodies which wish to be supplemented in this record are certainly made a part of it, and subsequently if you request, we will certainly send you a copy of the entire proceedings.

So with that in mind, realizing the Chairman's schedule, let me just thank both of you and say I think the statements you have made are self-explanatory, and do not really require any questions from me. Thank you.

The CHAIRMAN. Our fourth panel is Mr. Jay Campbell, Executive Director of the Port of Abbeville, Louisiana and Mr. Jerry Theunissen, Jennings Airport Authority, Jennings, Louisiana.

Mr. Campbell, I think we will let you begin.

TESTIMONY OF JAMES W. CAMPBELL, EXECUTIVE DIRECTOR, PORT OF ABBEVILLE, LA AND GERALD J. THEUNISSEN, JENNINGS AIRPORT AUTHORITY, JENNINGS, LA

Mr. CAMPBELL. Thank you, Mr. Chairman, members of the Committee, I appreciate the opportunity that you have afforded us today and I hope that your stay in the Acadiana region is both pleasant and informative.

Before I get into the main body of my text, I would like to take this time to thank you all for the actions you took on behalf of our District regarding Freshwater Bayou. I do not think anybody in the United States can ask for better response time to a cry for help. It was really nice to learn that at the federal level things still do happen fast.

Members of the Committee, the area of concern I address today is one of vital importance to the immediate vicinity of Vermilion and Lafayette Parishes as well as the region which the federal project known as Freshwater Bayou Channel serves. Freshwater Bayou Channel is the eastern boundary of the Mermentau Basin, one of the most productive agricultural areas in the United States.

Freshwater Bayou skirts the western edge of the Vermilion Bay estuarine complex which provides the delicate conditions necessary for commercial and sport fishing species a place to grow. The development of the Freshwater Bayou system has been instrumental in the growth of Vermilion, Lafayette and Iberia Parishes energy-related activities over the last 23 years and has assumed a role as one of the fundamental elements of the economy in the Acadiana region.

Since the authorization of the project by the 1986 Congress, Intracoastal City has become one of the busiest logistics and operations ports in the nation, supporting the inland, near-shore and off-shore operations of the nation's energy producers. Original estimates of tonnages for the project were placed at 500,000 tons annually. Corps of Engineer figures indicate that in calendar year 1989, six million plus tons transited the local facility itself at the southern terminus of the project. These figures do not include embarkations from the Port of Intracoastal City and Vermilion that traveled the waterway to in-shore locations north of the lock facility that were never recorded in the official corps statistics. The Freshwater Bayou Channel is indeed, gentlemen, the umbilical cord necessary for sustaining operations in this region of the Gulf of Mexico for energy producers. These producers rely on the waterway for predictable, uninterruptible flow of supplies to develop the energy reserves our nation depends on. These figures do not reflect a waterway taxed to capacity, but portray a project of vital importance to the local, regional and state economies, in addition to the role it plays in the search for energy reserves for our nation.

The waterway begins at the Gulf Intracoastal Waterway and proceeds in a southerly direction to the Gulf of Mexico, for a distance of 20 miles through wetlands and serves as the eastern boundary of the Mermentau Basin, as I have said. The Mermentau Basin itself is protected by Congressional action and is one of the largest agricultural producers in the nation. It plays a major role in making Vermilion Parish the second leading agricultural producer in the State of Louisiana and the fifth largest rice producing parish in the nation. Together, agriculture and livestock accounted for $89 million in production in 1989 in Vermilion Parish. Since 1989, grain shipments from the Port of Vermilion have been about two million bushels each year by barge. This is expected to increase.

In the 1980s, Intracoastal City began to grow as a major seafood port and in 1988 ranked as the eighth leading seafood port in the nation. Much of that success can be attributed to the proximity of the Vermilion Bay complex, which marine life depends upon to grow. Intracoastal City is also home to the fifth largest single commercial seafood landing dock in the nation.

The Freshwater Bayou Channel project and locking system is a key element in all of the above-mentioned economic sectors, either as the basic transportation mode or serving in its capacity as saltwater barriers. As we speak, the Freshwater Bayou lock system itself is undergoing scheduled maintenance that is required every 10 to 15 years. Since first opened to traffic in 1967, this procedure has only been performed once before, in 1977. At that time, equipment being used prior to the opening of the system was still available and many operators could utilize this aging equipment to help alleviate some of the inconvenience and relocation that occurred.

Since 1977, the commercial fleet has changed dramatically to reflect the capabilities of the channel, and during the recent turndown in the energy sector, much of that old fleet was scrapped due to age and economic consideration of that time. The traditional routes that were used in 1977 no longer had the capacity to accommodate the traffic the Freshwater Bayou had carried. The Corps of Engineers, in an attempt to partially relieve some of the hardships, has adopted work schedules that isolates the closure periods to three short time frames in place of one longer closure period of 90 to 100 days. This will help some. However, it points to the need for alternatives once this need arises again in ten years.

In a worst case scenario, unexpected failure of this system could be disastrous to the area because of lead times, a year in some cases, for replacement parts unique to each system. This is a subject which deserves your most serious consideration.

The State of Louisiana built a bypass system around the locks in 1985 and 1986 for a specific purpose, to accommodate wide loads bound for Alaska by barge. This system was not designed to handle the 15,000 plus lockages per year that occur at Freshwater Bayou. But considering the investment in the facility, it could be utilized by the Corps of Engineers to install a locking system at a reduced cost to the federal government, since the cut already exists. This concept has merit and should be pursued.

The Freshwater Bayou Channel itself is situated in wetlands along both banks. This area is one of the richest fur bearing regions of the nation. With recent initiatives by the federal and state government beginning to address coastal erosion, attention has to be paid to the channel project itself. If it will continue to serve as the primary outlet to the Gulf of Mexico for this region, provisions will have to be made to stabilize the banks of the project. Should this occur, the channel will serve well into the 21st century. Because of its geographic location, the economic interests it serves and the important role it plays in the present and future development of southwest Louisiana, this channel could serve as a model for all projects of this nature.

Most importantly, with maintenance due again in ten years, increasing regulatory requirements, environmental and conservation concerns, the possibility of building new projects to replace old ones are questionable. Updating and improving existing facilities will be necessary to keep pace with the growth trends in coming years. Since this federal project is an important catalyst to the region, planning needs to begin now that reflects a balance for all of the points addressed and many that time constraints do not permit, but are of equal importance.

The CHAIRMAN. Jerry Theunissen.

[The prepared statement of Mr. Campbell appears on p. 798.]

Mr. THEUNISSEN. Good afternoon, Mr. Chairman, Congressman Hayes, members of the Committee. I am Jerry Theunissen, Manager of the Jennings Airport, a small general aviation, public-use airport in southwest Louisiana. My prepared remarks this afternoon will address the vital role general aviation airports play in our transportation infrastructure with emphasis on Louisiana, and a disturbing trend in loss of airports open for public use.

Today there are approximately 5,500 large airline type aircraft in use by scheduled carriers, and these only serve about 572 of the nation's 17,000 plus airports and landing areas. In addition, there are about 18,500 military aircraft operating in the United States. The remaining aircraft registered in the United States fall under the category of general aviation. These aircraft, numbering more than 270,000, are owned by individuals, businesses, corporations and non-military governmental agencies. There are more than 750,000 licensed general aviation pilots in the United States, who fly more than 80 million flights a year, carrying an estimated 120 million passengers. General aviation is a multi-billion dollar contributor to our nation's economy. While the economic impact of commercial carrier airports is widely recognized, what is often overlooked is the surprising potential of smaller, general aviation facilities. The Louisiana airport system, general aviation especially, has had an erratic history. After decades of progress and growth, the fiscal austerity of the 1980s halted progress in many general aviation facilities across the state. Community support for airports suffered when aviation had to compete for limited public funds with other pressing needs.

Louisiana has 62 general aviation public-use airports. These airports represent a golden opportunity to improve transportation and economic development in the state. In talking with potential business investors, the question that is most prominent in their minds is whether or not they will have easy air access from their corporate offices to the business location here. Aviation is going to be the key to getting certain types of industry to locate in this state. The airport program, when properly designed and in effect, will do as much for Louisiana from an economic development standpoint as will the new highway program.

A major update to Louisiana's airport system plan, designed to help the state face changing economic conditions with an integrated airport infrastructure, is underway at the Louisiana Transportation Research Center. The plan, which is a condition for continued FAA funding for expansion of the airport system, will result in a five-year capital improvement program for airport development, as well as 10, 15, and 20 year plans for long-range aviation needs. A special feature of this update is that it marks the creation of a permanent aviation systems planning staff for DOTD, which in the past had to rely on consultants for aviation systems planning.

The largest airports in Louisiana, those serving commercial air carriers, have not been of overriding concern to state officials because they generally support their own planning and development, but many general aviation public-use airports rely on state assistance to match FAA grants for capital improvements, as well as to provide planning and technical support. The recent approval of the transportation trust fund by Louisiana voters will relieve some of the problems of the past by providing a stable source of state revenue for airport capital improvements.

The national plan of integrated airport systems (NPIAS) is published by the Secretary of Transportation for the development of public-use airports in the United States. The plan is limited to development that is potentially eligible for federal funding under the airport improvement program. As of March of last year, NPIAS contained 3,273 of the nation's 17,000 plus airports. The importance of being included in this document cannot be over-emphasized. Louisiana has 58 existing and proposed locations included.

There is one disturbing trend in general aviation. Between 1984 and 1989, there was a net loss of 289 airports open for public use. These closures occurred during an unprecedented economic upturn in the country. Should the country encounter a recession or a depression, the rate of loss of privately owned, open for public use airports will be significantly accelerated. Reasons for airport closures include encroachment by suburban development, oppressive regulations, high real estate taxes and economic recession. A plan involving the FAA, state aeronautics commissions and regional planning agencies must be developed to identify privately owned endangered airports that must be preserved. Funding would then be necessary to preserve these endangered airports.

Mr. Chairman, this concludes my statement. I would be happy to answer any questions.

[The prepared statement of Mr. Theunissen appears on p. 815.]

The CHAIRMAN. Well I would like to direct this question to both of you gentlemen. What steps do you expect to take to meet your particular infrastructure needs, and what kind of help do you expect from the state and the federal government?

Mr. CAMPBELL. Well speaking on the part of ports, the ports are a big part of the state highway transportation development trust fund, but that—and we are dealing with infrastructure—those funds are dedicated to port infrastructure inside the area of the immediate port vicinity. The problem that I addressed to you was a federal project that is in existence already, it is doing its job, it is a vital, vital part of the state, local and national economy.

What we are taking steps to address to you today is the need for the federal government to look with a long-range view at the project and make sure it continues in that role well into the next century. And it can, it has the capability to do it. What will be required from the time we start looking at it, to the time we actually implement some kind of plan of action in the way of local cost-sharing or whether it will be 100 percent federally funded is kind of hard for me to predict right now, because we do not know whether this will happen in 5, 10 or 15 years.

But as far as infrastructure development, the state has in place dedicated funds for port development inside the boundaries of the port, so to speak—and that is a very loose definition of it—inside the boundaries of ports you have channels, but the channels on the outside of the ports are not included in that.

So the federal responsibility or direction should be towards channels, the channels that connect, the channels that connect inland harbor areas to the Gulf of Mexico, the channels that connect the inland port areas to foreign trade or the off-shore energy sector.

Mr. THEUNISSEN. Mr. Chairman, I mentioned that there is a major update to Louisiana's airport systems plan that has been mandated by the federal government. This is underway at the present time. Once this is complete and we see exactly what our needs are within the state—and it is not to say that every airport that is open should remain open. We should selectively look at this program and find out what our needs are.

Fortunately there is a program in place with the federal government that is 90/10 matching funds from the airport improvement program. With the passage this past fall of the transportation trust fund, we now have some dollars within Louisiana to match that 90 percent, put up the 10 percent along with the 90 percent. Once we have received our marching orders from these particular studies, then we will have the funds within the state from this transportation fund, to go after the 90 percent matching federal funds. And we are going to make a concerted effort to do that.

So there is a mechanism in place already, and we are going after it within Louisiana.

The CHAIRMAN. Congressman Hayes.

Mr. HAYES. I really have two different questions, one of them a short discussion. Jay, you are intimately familiar with this because you are in the midst of the complications of—Louisiana is really an estuary system where we are not talking about the simplicity of a structure that stops something, like a dam or building a levee, we are talking about the ability to circulate water and you sit as an arbiter on many occasions with commercial fishing interests, with farming interests, recognizing that a balance has to be made in all of that, and therefore in your own mind you conclude and have a reasonable plan of what works, not just to accommodate interests, but what is necessary for the balancing so that both agriculture and aquaculture and farming can continue to exist.

Based upon your experience, would you be supportive or not supportive of doing a similar thing to what we do in highways where the federal government has a role, but that the plan, the basic highway plan, comes from the state and where the implementation of that and some of the priorities created are created at the state level. In other words, when we talked about highways earlier and competition within projects within the state, while the federal government funds and does matching funds, the state priorities on projects are determined in Baton Rouge, not in Washington, DC.

What would be your reaction to proposals that have been made by some members of Congress that we should do a similar thing where the Corps plays a role, where the EPA plays a role, but where it is a state plan that cannot violate standards but in effect is generated at the state level and where the concentration of decision-making is under a one-stop shop produced by the plan to avoid a multitude of agencies, what would your reaction to that proposal be?

Mr. **Campbell.** You are talking about setting up a national guideline format, but one-stop shopping for permitting and planning and zoning and so forth?

Mr. **Hayes.** And an oversight.

Mr. **Campbell.** As far as our perspective, Congressman Hayes, that would end a lot of nightmares as far as permit regulations and so forth. It would ease the burden of trying to justify your case. It would provide for quicker action as far as from project inception to planning, to construction. And remember, I am doing this with a tilt toward waterways because you have to remember waterways are a dynamic mode of transportation as opposed to a highway, which is basically laid and then is repaired or filled in. But waterways, especially in this area of the country, as you know, are a very sensitive subject and they need more local input from the local level. The more you get that, the better off you are because very often in the grand scheme of things, the local needs are overlooked.

Mr. **Hayes.** And to change the subject entirely—not the general subject but specifics—one of the things that I have learned in recent months in dealing with the proponents of the expansion of New Orleans International Airport is that the City of New Orleans has lost dramatically what historically had been southern routes into Central America, and secondly that the facility in New Orleans has not reacted to what has been enormous increase in air cargo. We were talking earlier about modes of transportation competing, and there are many people who believe that air cargo will reach the cost effectiveness level to be the dominant shipper of the 1990s.

Given the idea that we are looking for international routes and the importance of global markets in today's economy, it is easy to see the needs of a big international airport and given the fact that cargo is essential in its movement across the width and breadth of long distances, it is easy to see where those kind of hubs can take place and where competition on what used to be military installations, for example, be affected.

In those two areas, in areas of feeding into international trade and in the areas of moving cargo, where do you think—where is the most important role and what would you say would be the most effective way of taking those two facts and turning them into the most benefit for the smaller public facilities terminals of which you are intimately involved and concerned with?

Mr. **Theunissen.** First of all, in New Orleans, as you are well aware, there is a tremendous program underway to possibly some day have a hub right there in New Orleans, as we do in Atlanta or Dallas and a couple of other places in the country. So this in itself would be a tremendous boost for Louisiana, and of course any time that anything comes in that expands and moves over the borders. But in moving specifically cargo, we find that in the oilfield, for instance, when things get rough the inventories go down and high value items are left on the shelf back at the home station and when these high value items are needed out in the Lake Arthur field or something such as this, they are flown in. And thereby saving all of the money that of course is involved in stocking these high value items, and from what central location you can disperse them. So the idea of cargo is very important—these small airports are extremely important to get out to these facilities in a hurry.

The other thing, any time a business is going to look at locating in an area, one of the first things that they will come up with is what is your air access to my particular offices, to my supplies, to my middle managers to get out. So it does play a very important role.

Mr. HAYES. Thank you very much. I do not have any other questions.

Let me just conclude because I know the Chairman wishes to make a closing statement, by again thanking Glenn Anderson, who I think brings a unique combination of qualifications to a hearing like this—as I told a group of press earlier where some of you were not present, he was a mayor of a major city, Long Beach, California; he served the state as Lieutenant Governor, giving him a position of access to the executive office of a major state that is larger than most countries; and now he is Chairman of a Congressional Public Works and Transportation Committee, so the local, state and federal level are blended in public service in the Congressman from Long Beach, California. And I very much appreciate his bringing that vast expertise and understanding to southwest Louisiana.

Again thank you for making the trip and thank him for his cooperation and that of his very fine staff in the past in assisting us with specific and general needs for the future of southwest Louisiana.

The CHAIRMAN. Thank you, Jimmy.

I want to thank all of our witnesses here today for their expertise and for helping us better understand the importance of our Nation's infrastructure needs from the perspective of southwest Louisiana. It is clear that our emerging national wetlands policy will have a major impact on growth and productivity for the foreseeable future.

I also want to thank the people of the Seventh District for their warmth and southern hospitality, and Jimmy, I thank you for your untiring interest and enthusiasm and your staff for their hard work on making today's hearing possible.

And with that, the Committee stands adjourned. Thank you very, very much.

[Whereupon, at 4:10 p.m., the Committee was adjourned.]

TESTIMONY

OF

W.L. BERRY, DIRECTOR

ENVIRONMENTAL AFFAIRS & SAFETY

THE LOUISIANA LAND AND EXPLORATION COMPANY

NEW ORLEANS, LOUISIANA

Before the

Committee on Public Works & Transportation

August 6, 1990
Lafayette, Louisiana

Thank you Mr. Chairman - members of the Committee. I am Bill Berry, Director, Environmental Affairs & Safety for the Louisiana Land & Exploration Company or LL&E as we refer to it. I am located in New Orleans, Louisiana.

LL&E is the largest private owner of coastal wetlands in the United States. We own over 600,000 acres of marshlands, all of which are located in Southeastern Louisiana. As a large property owner, we are pleased to appear here today and discuss infrastructure problems in the State of Louisiana, particularly in wetland areas. While our comments are based on our experiences and observations as an owner of coastal wetlands, they are certainly applicable to infrastructure situations throughout the state.

The company and I are proud of our land. Since the early 1950's, we have recognized wetlands loss as a serious problem and have engaged in an intensive conservation program to protect our property. We are pleased that wetlands loss, which has reached critical proportions in Louisiana, is finally receiving the national attention it deserves. This is extremely important since the Corps of Engineers currently estimates that up to 35 square miles of Louisiana marshlands are disappearing each year -- over 20,000 acres.

However, we are not pleased with the present Section 404 permitting situation which has the potential to practically stifle all development within Louisiana's wetlands, infrastructure and otherwise. In the time available today, I would like to focus on one problem area -- that of definition of a wetland that must be protected under the 404 program.

LL&E has no objection to the basic statutory definition which states that lands should be classified as wetlands if three indicative characteristics are present: hydrology, hydrophytic vegetation and hydric soils. There appears to be general agreement among experts that these three factors are the primary scientific indicators of wetlands.

However, over the past year there have been numerous instances in which lands not previously believed to meet the Federal criteria for wetlands delineation have been determined to fall within the statutory definition. This is a result of the application of the Federal Manual for Identifying and Delineating Jurisdictional Wetlands (Manual), which was adopted on January 10, 1989. The Manual provides a very complicated and technical set of directives to agency field personnel for use in determining whether the three statutorily required indicators of wetlands are present.

Although the effect of the Manual is not yet fully understood, some potentially troublesome consequences are already evident. For example, the presence of wetlands hydrology ordinarily should require the presence of saturated soil conditions or inundation for some portion of the growing season. However, under current agency practice, the presence of water within 18 inches of the surface for a minimum of seven days of the growing season is sufficient to satisfy the hydrology requirement. Under such a test, lands may be wetlands even when standing water or wet surface soil conditions cannot be observed. Thus, areas that have not traditionally been viewed as wetlands, such as prior converted farmlands, elevated hillsides and hardwood forests, are falling within the wetlands definition. This interpretation puts a substantial burden on landowners to attempt to anticipate the presence of wetlands even where obvious indicators are not available. It also extends regulatory jurisdiction over lands that lack the ecological characteristics of wetlands and may therefore be outside the scope of lands that require regulation in the interest of wetlands protection.

Problems have also arisen as a result of the diminishing use of two of the three major indicators, hydrology and hydrophytic vegetation, in delineating wetlands. The Louisiana Farm Bureau Federation estimates that of the 4.8 million acres of agricultural lands now classified as wetlands in Louisiana, approximately 4.3 million acres have been delineated as wetlands solely on the basis of soil type and as a direct result of the Delineation Manual. By failing to delineate wetlands by all three criteria, agencies have broadened the sweep of Federal regulatory programs far beyond that contained in the statutory definition of wetlands.

For example, approximately 14.6 million acres or 53 percent of the Louisiana land area consists of hydric soils which are presently being treated as wetlands. These are the entire areas shown in grey on the poster. Wetlands are checkerboarded throughout the blue areas. And the remainder of the state is not wetlands-free. For example, in the large area marked "1", all of the soil in red on the second poster is hydric and therefore wetlands. The situation is similar across the country. In California, there are nearly 3 million acres of hydric soils and in Texas about 15 million acres.

As long as the current practices and interpretations under the Manual govern the delineation process, the general statutory definition will continue to be applied to categories of lands that do not possess typical wetlands characteristics and values. While some environmental regulation of these land resources may be appropriate for other conservation purposes, lands that do not meet the full measure of the criteria for wetlands delineation should not be regulated under a wetlands management regime. This includes infrastructure and all other development projects.

Time will not permit a discussion of the other wetlands issues of concern for all types of development, infrastructure and otherwise, that must be addressed. These are: the goal of no net loss of wetlands and strict sequencing. However, they are also of great importance.

Finally, I would like to commend Congressman Hayes for the recent introduction of H.R. 4212. This bill will provide for a federal tax credit for expenditures for conservation measures taken to protect wetlands of the United States. It will allow owners of wetlands - like LL&E, both in Louisiana and across the entire country, to assist in achieving no net loss of wetlands values, in an extremely cost-effective manner.

Thank you for the opportunity to appear before this committee hearing. LL&E is dedicated to the conservation of Louisiana's precious wetlands heritage. We will work with the committee in any way we can. I would now be happy to address any questions.

Mr. Chairman, Members of the Committee

I appreciate the opportunity that you have afforded us today, and hope that your stay in the Acadiana region is both pleasant and informative.

Members of the Committee, the area of concern I address today is one of vital importance to the immediate vicinity of Vermilion and Lafayette Parishes as well as the region which the Federal Project, known as Freshwater Bayou serves. Freshwater Bayou Channel is the eastern boundary of the Mermentau Basin, one of the most productive agricultural areas in the United States.
Freshwater Bayou skirts the Western edge of the Vermilion Bay estuarine complex which provides the delicate conditions necessary for commercial and sport fishing species a place to grow. The development of the Freshwater Bayou System has been instrumental in the growth of Vermilion, Lafayette, and Iberia Parishes energy related activities over the last twenty-three (23) years, and has assumed a role as one of the fundamental elements of the economy in the Acadiana region.

Since the authorization of the Project by the River and Harbor Act of 1960, of the 86th Congress Intracoasal City has become one the busiest logistics and operations Ports in the nation supporting the Inland, Near-Shore, and Off-Shore operations of the Nations energy producers. original estimates of tonnages for the Project were placed at 500,000 tons annually. Corps of Engineer figures indicate that in Calendar year 1989, 6,000,000+ tons transited the Lock facility itself at the southern terminus of the project. These figures do not include embarkations from the Port of Intracoastal City and Vermilion that traveled the waterway to inshore locations north of the Lock facility that were never recorded in the official Corps statistics. The Freshwater Bayou Channel is indeed gentlemen the umbilical cord necessary for sustaining operations in this region of the Gulf of Mexico for Energy Producers. These producers rely on the waterway for predictable, uninterruptable flow of supplies to develop the energy reserves our nation depends upon. These figures do not reflect a waterway taxed to capacity but portray a project of vital importance to the local, regional, and state economies, in addition to the role it plays in the search for energy reserves for our nation.

The waterway begins at the GIWW and proceeds in a southerly direction to the Gulf of Mexico for a distance of 20 miles through wetlands and serves as the eastern boundary of the Mermentau Basin. The Mermentau Basin itself is protected by Congressional action and is one of the largest agricultural producers in the nation. It plays a major role in making Vermilion Parish the 2nd leading agricultural producer in the State of Louisiana ($49,000,000. 1989), and the fifth largest rice producing parish (county) in the nation. Together, agriculture and livestock accounted for $89,000,000.00 in production in 1989. Since 1989, Grain shipments from the Port of Vermilion have been about 2,000,000 bushels per year by barge. This is expected to increase.

In the 1980's Intracoastal City began to grow as a major seafood port and in 1988 ranked as the 8th leading seafood landings port in the nation. Much of that success can be attributed to the proximity of the Vermilion Bay complex, which marine life depends upon to grow. Intracoastal City is also home to the fifth largest single commercial seafood landing dock in the nation.

The Freshwater Bayou Channel Project and Locking system is a key element in all of the above mentioned economic sectors, either as the basic transportation mode or serving in its capacity as a saltwater barrier. As we speak the Freshwater Bayou Lock system itself is undergoing scheduled maintenance that is required every ten to fifteen years. Since opened to traffic in 1967, this procedure has only been performed once before, in 1977. At that time, equipment being used prior to the opening of the system was still available and many operators could utilise this aging equipment to help alleviate some of the inconvenience and relocation that occurred. Since 1977, the commercial fleet has changed dramatically to reflect the capabilities of the channel and during the recent turndown in the energy sector much of that old fleet was scrapped due to age and economic consideration of that time. The traditional routes that were used in 1977 no longer had the capacity to accommodate the traffic the Freshwater Bayou had carried. The Corps of Engineers in an attempt to partially relieve some of the hardships has adopted work schedule that isolates the closure periods to three short time frames in place of one longer closure period of 90-100 days duration. This will help some, however it points to the need for alternatives once this need arises again in ten years. In a worst case scenario, unexpected failure of this system could be disastrous to the area because of lead times, a year in some cases, for replacement parts unique to each system. This is a subject which deserves your most serious consideration. The State of Louisiana built a By-Pass system around the Locks in 1985-86 for a specific purpose to accommodate wide loads bound for Alaska by barge. This system was not designed to handle the 15,000+ lockages per year that occur at Freshwater Bayou, but considering the investment in the facility it could be utilized by the Corps of engineers to install a locking system at a reduced cost to the Federal Government since the cut already exists. This concept has merit and should be pursued. The Freshwater Bayou Channel itself is situated in wetlands along both banks. This area is one of the richest fur bearing regions of the nation. With recent initiatives by the Federal and State Government beginning to address coastal erosion, attention has to be paid to the Channel project itself. If it will continue to serve as the primary outlet to the Gulf of Mexico for this region, provisions will have to be made to stabilize the banks of the project. Should this occur, the channel will serve well into the 21st century. Because of its geographic location, the economic interests it serves, and the important role it plays in the present and future development of southwest

Louisiana, this Channel could serve as a model for all projects of this nature. More importantly with maintenancedue again in 10 years, increasing regulatory requirements, environmental and conservation concerns, the possibility of building new projects to replace old ones are questionable. Updating and improving existing facilities will be necessary to keep pace with the growth trends in coming years. Since this Federal project is an important catalyst to the region, planning needs to begin now that reflects a balance for all of the points adressed and many that time constraints do not permit but are of equal importance.

James W. Campbell
Abbeville Harbor & Terminal

TESTIMONY OF CURTIS F. HOGLAN, PRESIDENT & CEO,
LAFAYETTE ECONOMIC DEVELOPMENT AUTHORITY
BEFORE
THE FULL COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
OF THE
UNITED STATES HOUSE OF REPRESENTATIVES
MONDAY, AUGUST 6, 1990

Mr. Chairman, I appreciate the opportunity to relate to you and the committee, from an economic development perspective, what I believe to be the primary challenges and needs of our area in terms of physical infrastructure. Time does not permit me to go into many specific details, but I want to highlight the areas I believe need the most attention. There are many things in this regard that we can do for ourselves at the local level, and we are trying to do that, but I will enumerate areas that I believe your committee can impact and where action at your level is needed and appropriate.

In the State of Louisiana, further development of our ports is crucial to our economic recovery and our participation in the global economy. The economic implications of our location on the Gulf of Mexico and our proximity to Central and South America and access to more distant markets, make this a priority for us. We need unobstructed navigation channels from several of our ports to the Gulf. We need dredging and increased maintenance of portions of the Intracoastal Waterway and access lanes to the Gulf. In some cases, new, higher and wider bridges are needed to accommodate traffic of larger vessels, particularly off-shore platforms and other large structures. Our industries involved in these projects, in many instances are unique to this area and are now limited in bidding and receiving needed work because of their inability to receive and discharge this very large cargo.

We continue to witness the demise of rail lines in this country. It is particularly true for short lines, often connecting the smaller towns and rail users to the main lines. This greatly hurts the economic growth in small towns, many of which are not located on Interstate highways. We are currently trying to save 20 miles of track in the local area that the Railroad Company has announced it will abandon and sell for salvage. We are stymied in our efforts due to no funds available to buy it, refurbish it, and operate it. Although current rail customers on this segment are insufficient to make the line economically successful, we need to preserve it for future economic growth. Once the steel is removed and the right of way is returned to land owners, I believe it is gone forever--the cost of building it over from scratch will be certainly prohibitive. We need funding to assist in saving these lines. Also some tax or other incentives would help attract short line rail operators in operating over these lines.

I won't comment in any detail on this next item, because I don't know enough about the details of what is needed and how it can be done. I am also sure that your committee will receive testimony by people that are experts in this area. But our airports are also absolutely critical to the economy and need massive improvements to keep up with technological advances, increased demands, and other requirements.

As I'm sure you are finding in other states, the difficulty in extending water, sewer, and access roads, hinders our efforts to attract new industry and assist expanding industry. The provision of water and sewer to industry is a particularly difficult problem for smaller municipalities that do not have a large tax base to support this rather expensive endeavor, especially if it involves increasing capacity, as well as providing water and sewer line extensions. Louisiana is trying to improve our highways with our new Transportation Trust Fund, but we ask your continued support of federal programs to assist in these areas. We specifically ask your continued support of the Economic Development Administration, which greatly assists in providing matching funds for infrastructure improvements.

It may be a little off-base to ask your support of the extension of Tax Exempt Industrial Development Bond financing of manufacturing facilities, but I'm going to do it anyway. Perhaps your committee has nothing to do with it---I believe it is within the purview of the Ways and Means Committee, but maybe you could relate to Representative Rostenkowski and his troops just how critical the extension of this provision is. As you know the sun sets on this issue the end of September if it is not extended. Both of Louisiana's US Senators have signed on as co-sponsors of a Senate Bill to extend it, and Congressman Jimmy Hayes has joined almost all other Louisiana Representatives--I should say led since he was the first to sign--as co-sponsors to Rep Flippo's House Bill to extend IDBs indefinitely. The relationship of this legislation to infrastructure may appear to be rather remote and not so obvious, but there certainly is a relationship, indeed a partnership in helping to create jobs, generating money for the tax base and economic growth.

I appreciate being able to talk with you today, and I appreciate your demonstrated concern, manifested by your presence here today. Thank you for coming, and welcome to Louisiana.

Honorable Glen M. Anderson
Chairman
Committee on Public Works and Transportation
U.S.House of Representatives

Future of Southwest Louisiana Infrastructure Needs in reference to Regional Hearing on future of our Nation's Infrastructure Needs

Address By: Vernon F. Meyer, President of Meyer and Associates, Inc., Consulting Engineers, Sulphur, Louisiana.

Date: Monday, August 6, 1990

Honorable Chairman Anderson and Committee:

Southwest Louisiana, Villages, Towns, Cities, and Parishes are facing the same infrastructure need problems as found in most communities and counties throughout the United States. The average annual rainfall of 60" per year has probably created more problems associated with the wastewater systems and roads than are found in most areas of the United States. The soils of Southwest Louisiana are not the best suited for construction of roadways and utility systems thereby requiring increased costs for their respective development.

One of the most critical needs facing the public utilities today are rehabilitation and/or replacement of wastewater collection systems. Most systems that are aged from 20 to 100 years old have serious structural needs or deteriorated joint conditions. With the rainfall in Louisiana, this condition has caused abnormal amount of inflow/infiltration into the wastewater system and roadway failure above the lines. To transport, pump and treat the added wastewater flow makes the situation expensive for public utilities. All waste water systems are presently being mandated or going to be mandated by EPA to upgrade their treatment which is needed to improve our environmental conditions but is also adding an increased financial burden on the consumer.

The solution for funding these deficiencies in the infrastructure for public utilities and roads needs to be addressed now, in the same manner and magnitude as Congress did in 1972, addressing the wastewater program.

The recent adoption of a new Wetlands Mitigation Policy by the Army Corps of Engineers and U.S. Environmental Protection Agency will have a significant effect on future expansion projects for all Gulf ports, including the Port of Lake Charles. In Calcasieu Parish most of the larger undeveloped property tracts located adjacent to deep water (Calcasieu Ship Channel) can be classified as wetlands or partially wetlands. Thus as the Port develops new waterfront property it will inevitably be faced with the task of minimizing any detrimental effects on wetlands or possibly compensatory mitigation. The net result is that property development costs including the associated technical cost will be significantly higher.

Another problem that Port Authorities must deal with is dredged material disposal areas. As existing spoil disposal areas are filled, new disposal areas must be found. Again, most large undeveloped property tracts located adjacent to deep water can be classified as wetlands. The Corps of Engineers is currently performing a study of the remaining lifespan of existing dredged material disposal areas along the Calcasieu Ship Channel. It is possible that in the near future the Port will be faced with disposing of at least a portion of its dredged materials at sea. Trade development should also be considered in a possible solution of the new Wetlands Mitigation Policy.

Thank you for the honor of being able to appear before this committee to express brief comments in regard to our infrastructure needs of Louisiana and expansion capabilities of ports along the Gulf coast, and more specifically the Lake Charles Harbor & Terminal District Port's expansion efforts.

Presentation to the Full Committee on Public Works and Transportation of the United States House of Representatives

Presented by Dr. H. Edward Murray

McNeese State University
Lake Charles, LA

The economic growth and development of the State of Louisiana is highly dependent upon the quality of its air and water, not only for its residents, but for retention and expansion of existing businesses and attraction of new viable industry. The goal of providing more and better job opportunities has long been an activity of enterprising communities.

Experience has shown that most successful programs are the result of dedicated local leadership and supportive citizens. State colleges and universities play a vital role in the leadership of the community. Many of the new jobs in this region will be created through growth of existing firms. In order to facilitate that growth, businesses must be assured of receiving adequate information for addressing environmental concerns.

Petrochemical industries constitute a significant portion of the industrial base of the State of Louisiana. These industries have a profound impact on the standard of living that is enjoyed by the thousands of employees that represent their work force.

Louisiana (particularly Southwestern Louisiana) has long been known to have a high cancer rate. Citizens are apprehensive and fearful of public and industrial sources of pollution. Established Research Centers would address these concerns through data acquisition and field research aimed at obtaining results that will be used to solve regional and national problems. Local or regional universities generally have local support and public trust. These universities would serve as monitors for local environmental problems in contrast to a major university "out of" or across the state, for which public trust is not vested.

The impact resulting from injection wells, hazardous waste, effluents from public and industrial sources, air and ground water pollution are examples of pollution that concern the citizens of Louisiana. Research projects should be directed toward describing, quantifying, modeling and suggesting remediation for problem areas discovered during investigations.

Establishment of centers for environmental studies would provide pure and applied research involving environmental pollution. Results of these studies would be made available to local citizen groups, area industries, and parish, state, and federal agencies. The centers would provide information in areas involving contaminant hydrogeology, ambient air quality, environmental monitoring, collection and collating of new and existing data, and education of the general public.

The centers would work toward coordinating research efforts with regulatory agencies of the state and federal government, local and private agencies, and other state universities. Interfaces with appropriate data banks and agencies would be developed to exchange, consolidate, correlate, and summarize available data. State-of-the-environment information would be provided through state and local news media, workshops, seminars, and public forums.

Public trust in local universities should be an important consideration when establishing regional research centers. The success of McNeese State University in two large environmental studies demonstrates the wisdom of utilizing the talents provided by regional universities.

STATEMENT BEFORE
THE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
OF THE
UNITED STATES HOUSE OF REPRESENTATIVES
RELATING TO
CONDITION OF LOUISIANA'S STATE HIGHWAY SYSTEM
AND
SURFACE TRANSPORTATION REAUTHORIZATION LEGISLATION

BY

TED STOCKWELL

LOUISIANA DEPARTMENT OF TRANSPORTATION AND DEVELOPMENT

AUGUST 6, 1990

Mr. Chairman, I am Ted Stockwell. I am representing the Louisiana Department of Transportation and Development, and will present our views relative to state highway conditions in Louisiana.

There are 58,522 miles of public roads in Louisiana which include 16,622 miles in the state-maintained system of highways; 32,118 miles in the parish-maintained systems and 9,782 miles of city streets which are maintained by municipal governments. The state-maintained system is under the jurisdiction of the State Department of Transportation and Development and will be primarily addressed in this statement.

A highway needs assessment is conducted annually by DOTD on the entire state-maintained system of highways as mandated by Legislative Act. Existing conditions (geometrics, surface condition, level and classification of traffic) are defined for each roadway segment in the state system and these existing conditions are compared against acceptable standards to establish deficiencies.

Results from our latest study which was completed in the spring of this year indicate that 786 miles within the state system are in critical condition, 72 miles of these highways being on the interstate or other arterial system with the remainder on the rural collector system. An additional 1,658 miles are assessed to be in poor condition with 260 miles of interstate and other arterials falling within this category. The above defined mileage (critical + poor = 2,444 miles) are in a condition which requires reconstruction or rehabilitation now.

Additionally, our study indicates that there are 4,252 miles of highways in the state system that are in fair condition and are projected to require rehabilitation within the next five years. Assuming an average cost figure of $125,000 per mile for resurfacing/rehabilitation, eliminating the backlog of existing surface deficiencies and providing for elimination of projected deficiencies will cost approximately $837 million in the next five years.

Passage of the Transportation Trust Fund (State) by the Legislature and electorate during 1989 will dedicate state gasoline and diesel excise taxes to operations of the DOTD and to capital outlay for transportation improvements. It is believed that we can expect funding of $80 million per year from the Trust Fund for surface rehabilitation of state highways. Assuming this figure, available state funds for rehabilitation will be $400 million during the next five years (compared with $837 million in projected condition deficiencies).

When comparing existing volumes of traffic to design capacity on defined segments of our highway system, approximately 470 miles are shown to experience capacity problems. One hundred fifty two miles in this category are included for major widening in the TIME Program, a state funded program adopted in 1989 to improve selected highways within an intrastate network. Elimination of remaining known capacity problems after implementation of the TIME Program is estimated to cost $575 million not counting new mileage with capacity problems which will accrue each year. Practically all of this mileage is included in the Federal Aid Primary system, a system for which we have received approximately $38 million each year for the last 5 years.

Shown in the table below are figures which indicate the current status of bridges on public roads in Louisiana:

	Total Bridges	Structurally Deficient		Functionally Obsolete	
		No.	%	No.	%
On State System	7,806	1,162	14.9	1,245	15.9
Off State System	6,398	2,509	39.2	1,316	20.6
Total	14,204	3,671		2,561	

These figures indicate that there are 2,407 bridges (30.8%) on the state system that are deficient, either structurally deficient or functionally obsolete. A total of 3,825 bridges (59.8%) on the local systems are deficient in some way. Department engineers have estimated that $1.068 billion is needed to replace all bridges in Louisiana which qualify for replacement. For the past five years, Louisiana has received $32-35 million per year in Federal Bridge Replacement funds. Using the $35 million per year level coupled with the necessary state matching funds (currently 80% Federal 20% State), it will take approximately 24 years to replace bridges which are currently defined as deficient.

Completion of I-49 in the urbanized areas of Alexandria and Shreveport will mark the end of approved interstate projects in Louisiana. Emphasis in coming years will be preservation of and capacity improvements to the existing highway system. New dedicated state funds and continued receipt of funds from the Federal Highway Trust Fund will allow us to construct many of these needed improvements.

Our State Transportation Department has provided input to and fully supports the position of AASHTO relative to the Surface Transportation Reauthorization Legislation. This position was presented to the Surface Transportation Subcommittee of this Committee in March of this year by Mr. Kermit Justice, President of AASHTO, and others. In addition to emphasis on preservation and congestion relief on the existing system, we support the idea of highway user fees being dedicated solely to funding transportation improvements. People of this state voted last October 72% in favor of dedicating state gasoline and diesel taxes to transportation improvements. Our Department also supports the two-component program, one being a categorical program focusing on meeting national requirements and the second being a flexible state and local program which will enable states and local governments to tailor transportation solutions to their unique needs.

Thank you for coming to Louisiana and allowing us and other citizens of this state to present our views.

STATEMENT OF
GERALD J. THEUNISSEN
AIRPORT MANAGER, JENNINGS AIRPORT
JENNINGS, LOUISIANA
BEFORE THE FULL COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
U. S. HOUSE OF REPRESENTATIVES
AUGUST 6, 1990
LAFAYETTE, LOUISIANA

GOOD AFTERNOON, MR. CHAIRMAN AND MEMBERS OF THE COMMITTEE, I AM GERALD THEUNISSEN, MANAGER OF THE JENNINGS AIRPORT, A SMALL GENERAL AVIATION, PUBLIC-USE AIRPORT IN SOUTHWEST LOUISIANA. MY PREPARED REMARKS THIS AFTERNOON WILL ADDRESS THE VITAL ROLE GENERAL AVIATION AIRPORTS PLAY IN OUR TRANSPORTATION INFRASTRUCTURE WITH EMPHASIS ON LOUISIANA, AND A DISTURBING TREND IN LOSS OF AIRPORTS OPEN FOR PUBLIC-USE.

TODAY THERE ARE APPROXIMATELY 5,500 LARGE AIRLINE TYPE AIRCRAFT IN USE BY SCHEDULED CARRIERS, AND THESE SERVE ONLY ABOUT 572 OF THE NATION'S 17,000+ AIRPORTS AND LANDING AREAS. IN ADDITION THERE ARE ABOUT 18,500 MILITARY AIRCRAFT OPERATING IN THE UNITED STATES. THE REMAINING AIRCRAFT REGISTERED IN THE UNITED STATES FALL UNDER THE CATEGORY OF GENERAL AVIATION. THESE AIRCRAFT, NUMBERING MORE THAN 270,000 ARE OWNED BY INDIVIDUALS, BUSINESSES, CORPORATIONS AND

NON-MILITARY GOVERNMENTAL AGENCIES. THERE ARE MORE THAN 750,000 LICENSED GENERAL-AVIATION PILOTS IN THE UNITED STATES, WHO FLY MORE THAN 80 MILLION FLIGHTS A YEAR, CARRYING AN ESTIMATED 120 MILLION PASSENGERS. GENERAL AVIATION IS A MULTI-BILLION DOLLAR CONTRIBUTOR TO OUR NATION'S ECONOMY. WHILE THE ECONOMIC IMPACT OF COMMERCIAL CARRIER AIRPORTS IS WIDELY RECOGNIZED, WHAT IS OFTEN OVERLOOKED IS THE SURPRISING POTENTIAL OF SMALLER, GENERAL AVIATION FACILITIES.

THE LOUISIANA AIRPORT SYSTEM, GENERAL AVIATION ESPECIALLY, HAS HAD AN ERRATIC HISTORY. AFTER DECADES OF PROGRESS AND GROWTH, THE FISCAL AUSTERITY OF THE 1980'S HALTED PROGRESS AT MANY GENERAL AVIATION FACILITIES ACROSS THE STATE. COMMUNITY SUPPORT FOR AIRPORTS SUFFERED WHEN AVIATION HAD TO COMPETE FOR LIMITED PUBLIC FUNDS WITH OTHER PRESSING NEEDS.

LOUISIANA HAS 62 GENERAL AVIATION PUBLIC-USE AIRPORTS. THESE AIRPORTS REPRESENT A GOLDEN OPPORTUNITY TO IMPROVE TRANSPORTATION AND ECONOMIC DEVELOPMENT IN THE STATE. IN TALKING WITH POTENTIAL BUSINESS INVESTORS, THE QUESTION THAT IS MOST PROMINENT IN THEIR MINDS IS WHETHER OR NOT THEY WILL HAVE EASY AIR ACCESS FROM THEIR CORPORATE OFFICES TO THE BUSINESS LOCATION HERE. AVIATION IS GOING TO

BE THE KEY TO GETTING CERTAIN TYPES OF INDUSTRY TO LOCATE IN THIS STATE. THE AIRPORT PROGRAM, WHEN PROPERLY DESIGNED AND IN EFFECT, WILL DO AS MUCH FOR LOUISIANA FROM AN ECONOMIC DEVELOPMENT STAND POINT AS WILL THE NEW HIGHWAY PROGRAM.

A MAJOR UPDATE TO LOUISIANA'S AIRPORT SYSTEM PLAN, DESIGNED TO HELP THE STATE FACE CHANGING ECONOMIC CONDITIONS WITH AN INTEGRATED AIRPORT INFRASTRUCTURE, IS UNDERWAY AT THE LOUISIANA TRANSPORTATION RESEARCH CENTER. THE PLAN, WHICH IS A CONDITION FOR CONTINUED FAA FUNDING FOR EXPANSION OF THE AIRPORT SYSTEM, WILL RESULT IN A 5-YEAR CAPITAL IMPROVEMENT PROGRAM FOR AIRPORT DEVELOPMENT; AS WELL AS 10, 15, AND 20-YEAR PLANS FOR LONG-RANGE AVIATION NEEDS. A SPECIAL FEATURE OF THIS UPDATE IS THAT IT MARKS THE CREATION OF A PERMANENT AVIATION SYSTEMS PLANNING STAFF FOR DOTD, WHICH IN THE PAST HAD TO RELY ON CONSULTANTS FOR AVIATION SYSTEMS PLANNING.

THE LARGEST AIRPORTS IN LOUISIANA, THOSE SERVING COMMERCIAL AIR CARRIERS, HAVE NOT BEEN OF OVERRIDING CONCERN TO STATE OFFICIALS BECAUSE THEY GENERALLY SUPPORT THEIR OWN PLANNING AND DEVELOPMENT. BUT MANY GENERAL AVIATION, PUBLIC-USE AIRPORTS, RELY ON STATE ASSISTANCE TO MATCH FAA GRANTS FOR CAPITAL IMPROVEMENTS, AS WELL AS TO PROVIDE PLANNING AND TECHNICAL SUPPORT. THE RECENT APPROVAL

OF THE TRANSPORTATION TRUST FUND BY LOUISIANA VOTERS WILL RELIEVE SOME OF THE PROBLEMS OF THE PAST BY PROVIDING A STABLE SOURCE OF STATE REVENUE FOR AIRPORT CAPITAL IMPROVEMENTS.

THE NATIONAL PLAN OF INTEGRATED AIRPORT SYSTEM (NPIAS) IS PUBLISHED BY THE SECRETARY OF TRANSPORTATION FOR THE DEVELOPMENT OF PUBLIC-USE AIRPORTS IN THE UNITED STATES. THE PLAN IS LIMITED TO DEVELOPMENT THAT IS POTENTIALLY ELIGIBLE FOR FEDERAL FUNDING UNDER THE AIRPORT IMPROVEMENT PROGRAM. AS OF MARCH 31, 1989, NPIAS CONTAINED 3,273 OF THE NATION'S 17,000+ AIRPORTS. THE IMPORTANCE OF BEING INCLUDED IN THIS DOCUMENT CANNOT BE OVER EMPHASIZED. LOUISIANA HAS 58 EXISTING AND PROPOSED LOCATIONS INCLUDED.

THERE IS ONE DISTURBING TREND IN GENERAL AVIATION. BETWEEN 1984 AND 1989 THERE WAS A NET LOSS OF 289 AIRPORTS OPEN FOR PUBLIC USE. THESE CLOSURES OCCURRED DURING AN UNPRECEDENTED ECONOMIC UPTURN IN THE COUNTRY. SHOULD THE COUNTRY ENCOUNTER A RECESSION OR A DEPRESSION, THE RATE OF LOSS OF PRIVATELY OWNED, OPEN FOR PUBLIC USE AIRPORTS WILL BE SIGNIFICANTLY ACCELERATED. REASONS FOR AIRPORT CLOSURES INCLUDE: ENCROACHMENT BY SUBURBAN DEVELOPMENT; OPPRESSIVE REGULATIONS; HIGH REAL ESTATE TAXES; AND ECONOMIC RECESSION. A PLAN INVOLVING THE FAA STATE AERONAUTICS COMMISSIONS, AND REGIONAL

PLANNING AGENCIES MUST BE DEVELOPED TO IDENTIFY PRIVATELY OWNED ENDANGERED AIRPORTS THAT MUST BE PRESERVED. FUNDING WOULD THEN BE NECESSARY TO PRESERVE THESE ENDANGERED AIRPORTS.

MR. CHAIRMAN, THIS CONCLUDES MY STATEMENT. I WOULD BE HAPPY TO ANSWER ANY QUESTIONS.

WETLANDS AND LOUISIANA

A TESTIMONY TO THE FULL COMMITTEE OF PUBLIC WORKS AND TRANSPORTATION OF THE UNITED STATES HOUSE OF REPRESENTATIVES

by

Robert R. Twilley, Ph.D.
Associate Professor
University of Southwestern Louisiana

The natural resources of Louisiana represent one of the most productive wetland and economic resources of the United States. The statistics are staggering: wetlands in Louisiana make up nearly 40 percent of the total coastal vegetation in the conterminous United States; the lower Mississippi River valley has the largest stand of bottomland hardwood forests and swamps in the U.S.; the wetlands in Louisiana regularly winter over two-thirds of the Mississippi Flyway's waterfowl population, including 20-25% of North America's puddle duck population; the Gulf of Mexico produced nearly 40% by tonnage or 28% by value ($781,000,000) of the 1986 U.S. commercial fisheries landings, most of which was caught off the coast of Louisiana. The stock of these finfish, crustaceans, and shellfish and other wildlife are dependent on the estuarine habitats that are degrading at an alarming rate. Present estimates are that coastal wetlands are disappearing at a rate of 50 square miles per year, or an area equivalent to the size of this auditorium per hour. In addition, only 20 percent of the original area of bottomland hardwood forests and swamps in the lower Mississippi River valley remain today. Thus the focus of national attention is deserving to a region that has historically received insufficient funding for the management of immense environmental problems.

The development of infrastructure for the enhancement of transportation in Louisiana has to consider the importance of wetland ecosystems to the cultural, economical, and ecological resources of Louisiana. One of the most important considerations is alteration in local and regional hydrology that controls the structure and function of both forested wetland and marsh habitats. The frequency and duration of flooding determines the distribution, density, and growth of plant and animal species in wetlands. These species have specific morphological and physiological mechanisms that provide adaptations to environmental constraints established by hydrologic conditions. These structural characteristics of wetland communities are also influenced by the conditions of fertility established by flow of water that contribute sediment and nutrients.

Wetlands perform many important functions in local and regional watersheds such as providing food and habitat for fish and wildlife, stabilizing shorelines and controlling erosion, and abating water quality problems by removing pollutants. These functions are also dependent on structure of wetlands and particularly the flow of water. Food and habitat depend on the health and growth of wetland plants; sediment and shoreline control depend on distribution and discharge of sediments; and nutrient and water quality control depend on biogeochemical conditions established from the frequency and duration of flooding. Thus both the structure and function of wetlands are determined by the hydrologic characteristics of a region. In the past twenty years of research on wetlands, **hydrology** has been established as the key environmental parameter that controls the nature of wetland ecosystems.

The management of hydrology in relation to the structure and function of wetlands must have an hierarchial approach including local, state and regional perspectives. The flow of water from riverine watersheds transports sediments and nutrients that contribute to the productivity of coastal habitats. For example, the freshwater and fertile nutrients transported by the Mississippi River are linked with the immense wetlands of coastal Louisiana resulting in one of the most productive fisheries in the world. Yet coastal oceanographers believe a specific balance of these linkages is required to provide food and habitat for economically important fisheries. Alterations to local and regional hydrology that tend to uncouple these natural resources may influence the quantity and quality of coastal ocean productivity in Louisiana.

Public work and transportation projects must consider and evaluate the potential change in structure and function of wetland communities associated with alterations in hydrology. Consideration should also be given to modifications of existing infrastructure that have attributed to the tremendous loss of wetland habitats in Louisiana. Louisiana is an excellent example of a region where ecologists and engineers must design public work and transportation projects that **interface** the transportation needs of society with the value of wetland ecosystems. This perspective has to include not only alterations from a local or state level, but also modifications of regional proportion that uncouple important linkages among riverine, wetland, and coastal ecosystems.

Public work projects may also benefit from the ecological functions of wetlands that provide free services to local and regional economies. Wetlands influence water quality of rivers and coastal environments by either serving as a source or sink of nutrients. Many primary pollutants, such as nitrogen and phosphorus, that contribute to the eutrophication of rivers and streams, are utilized by wetlands for increased growth. This enhanced growth increases the habitat and food value of wetlands, thus providing a positive feedback to aquatic organisms.

This function of wetlands as a nutrient sink has resulted in the design of these natural resources for the tertiary treatment of wastewater released from small municipalities. Although there are several pilot projects that exist, such as a study here at USL with the city of Thibodaux, much more research and development is needed to improve the efficiency of these ecologically engineered resources. Given the wetland resources and economic base of many small municipalities in Louisiana, along with a suitable climate, there is great potential for the development of these wetland/wastewater ecosystems. Public work projects through grants to cities in Louisiana should encourage these wastewater recycling projects.

In summary, I would like for this committee to realize the significance of its projects to the protection and utilization of wetland resources in the state of Louisiana. This is not only associated with those public work and transportation activities within our own state, but also those in the entire watershed of the Mississippi region. The coastal ocean productivity of Louisiana depends on important linkages among riverine, wetland and coastal watersheds of the Mississippi River basin. Engineering projects must consider the ecological significance of these natural wetland resources in the design of infrastructure. In addition, projects of public works should consider the utility of the free services provided by the function of wetland resources, particularly in the design of tertiary wastewater facilities.

Thank you for this opportunity to explain the importance of wetland ecosystems as ecological and economical resources in Louisiana. I hope you have an occasion to see the unique wetland resources of our state during your visit to Lafayette.

ADDITIONS TO THE RECORD

Statement of Louis P. "Nee" Beglis

Members of the panel, I am Louis P. (Neé) Beglis, Police Jury: Calcasieu Parish.

Statistics show parishes are responsible for 43.5 percent of highway mileage and 45.4 percent of bridges 20 feet or larger. Of this number of bridges 74.8 percent qualify for rehabilitation or replacement. It is essential for rural roads to be improved in order to link the interstate system and to market for agricultural, logging, manufacturing, tourism, and other industries.

While basic maintenance has been and will continue to be a parish responsibility, the federal role in construction and rehabilitation must grow substantially as the increase of trucks and equipment rises. These vehicles have increased in number and size. This, therefore, increases the rate of deterioration and requires more to reconstruct to adequate standards.

The federal aid secondary program should be converted to upgrade parish and other local or state highways where it is appropriate to relieve congestion. It should also be used to build new routes to carry increasing traffic as the new federal transportation legislation is drafted. We should include language requiring all money in the trust fund be released as it is received and reserves not to be allowed to accumulate. Also we should ask no tax on users fee be used to pay the national debt.

STATEMENT BEFORE

THE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

OF THE

UNITED STATES HOUSE OF REPRESENTATIVES

Relating to

CONDITION OF LOUISIANA'S STATE SYSTEM OF AIRPORTS

AND THE REAUTHORIZATION

OF THE AIRPORT AND AIRWAY SAFETY AND CAPACITY EXPANSION ACT

By

JOSEPH D. LEVRAEA

LOUISIANA DEPARTMENT OF TRANSPORTATION AND DEVELOPMENT

DIVISION OF AVIATION

August 6, 1990

During the last half of the decade of the 70's and the early portion of the 80's, aviation in Louisiana experienced a period of substantial attention and growth due to an aggressive state aviation program, a responsive legislature, and fortunately, an economic atmosphere that provided sufficient financial resources for the program. Unfortunately, the attitude and foresight regarding aviation that was thought to be characteristic of our state and local leaders turned to apathy in the face of the diminishing revenues experienced by Louisiana during the last half of the 80's. For those who understand the economic importance of aviation to the health of an economy - local, state, or national - it is difficult to accept the lack of understanding that prevailed at that time and which resulted in such neglect. During this period, many airports in Louisiana were allowed to deteriorate or were unable to expand to meet current needs. Only those facilities which had achieved the ability to generate significant revenue were in a posture to adequately maintain their airports according to standards, or pursue any meaningful development activity.

It has been determined through an independent national study that the impact of civil aviation to the economy of this nation exceeds $522 billion annually. More importantly to Louisiana, the economic impact to this state alone is in excess of $4 billion annually. Aviation is a key element of the transportation infrastructure of any modern society at any level. Louisiana within the past two years has come to this realization, and with the overall endorsement of its citizens it has enacted legislation which resulted in the establishment of a transportation trust fund. A commitment has been made which dedicates all taxes collected on aviation fuels to the airport development program. This funding source within the transportation trust fund allows for the planning and project implementation needed to once again pursue an aggressive aviation program in Louisiana.

However, the economic dilemma and neglect of the previous four years has resulted in a program that is faced with a "catch-up" role for the next few years as it struggles to reconstruct a portion of the system which was not afforded proper attention and able to achieve compliance with current standards. Even though the appropriation available through the transportation trust fund represents the most substantial state funding allocation ever provided for the programmatic needs of the airports in Louisiana, these needs far exceed those which can be satisfied with state resources alone. Consequently, the assistance of the federal government through a state grant-in-aid program is essential to maintaining Louisiana airports at a developmental and operational status that appropriately satisfies the requirements of the national system of airports as established by the Federal Aviation Administration.

The Louisiana legislature recognized the need for efficiency in program implementation when it established the current transportation trust fund as is evident by the guidelines established under Act 451 of the 1989 regular session. It requires that all capital improvement projects must be selected in accordance with an objective Needs and Priority Process. This requirement provides reasonable assurance that only the most worthy projects receive priority attention based on criteria that most effectively promotes safety first. This is closely followed by projects chosen to preserve the existing system or upgrade the facility to meet current standards. The legislation also grants top priority to projects which receive funding assistance other than state. In such a situation, an airport which receives funding other than state at a participation of 90% or greater will be granted the highest priority when applying for state funds from the aviation appropriation within the transportation trust fund. This requirement mandatorily maximizes the amount of dollars available for capital improvement by leveraging additional financial resources from available grant-in-aid programs such as those typically offered through the FAA.

The Louisiana Department of Transportation and Development/Division of Aviation has been granted the funding mechanism to begin addressing the substantial needs of aviation in Louisiana. Along with the financial resources, it is also preparing to increase the personnel and technical resources of the Department to adequately administer the growing program. It intends to offer expanded services to local governments and airports statewide to ensure that the state system of airports in Louisiana receives the attention required to achieve and maintain its appropriate position within the national system of airports.

Now that Louisiana is in a position to help itself regarding aviation, it feels comfortable in requesting assistance from the federal government. It now has the ability to fully appreciate and maintain the integrity of a modern state system of airports. We are asking that any new aviation transportation policy adequately considers not only safety, capacity, security and environmental concerns but such things as economic development, air cargo and airport ground access. The role of the states should be strong in the area of locating, protecting, developing and expanding airports within their jurisdictions.

In summary, I would like to state that Louisiana has recently reidentified the importance of aviation to its transportation infrastructure and that it has provided the resources to address aviation needs. It is looking forward to a responsive program at the federal level to support the state system of airports regarding their role within the National Plan of Integrated Airport Systems. We look forward to a strong federal state partnership regarding aviation.

August 6, 1990

Glenn Anderson, Chairman
U.S. House Public Works & Transportation Committee
U.S. House of Representatives
Washington, D.C.

Dear Congressman Anderson,

The Republican Parish Executive Committee is excited about the new industry coming into the parish and the Abbeville area. It is good to see the parish job market becoming broadened and diversified. And it is encouraging that the oil field is gradually picking up. But we are very concerned about the traffic flow problems that are existing and that will worsen as our parish develops.

It is requested that your immediate attention be given to the improvement of traffic flow from Abbeville to the developing commercial areas in south Vermilion Parish. An increased congestion of commercial vehicles is occurring around Intracoastal City as we can see the increase of shrimping and oyster boats and the businesses to service them. Oilfield traffic has always been routed thru the city of Abbeville itself which congests downtown Abbeville, adds to the downtown noise level, and wears down the streets. As industry grows at Freshwater City and the Port of Vermilion, better routing of traffic will be needed to those areas.

Upon completion of the Four Laning projects of Highways 167 and 14 into Abbeville, further traffic problems will develop as this parish will become more desirable for business as well as tourism and residential development. To properly prepare for these events, some immediate steps need to be taken. The following proposals will also help some of the commercial traffic problems in the city of Abbeville.

First, extend Highway 167 at the Highway 14 "Business" intersection (Park and Port Streets in Abbeville) to a point south of Perry on Highway 82. This is a distance of five (5) or six (6) miles.

Second, realign Jacquelyn Street with Highways 330 and 82 (Alcide Drive, Jacquelyn and South State Streets) in Abbeville. Improve Jacquelyn and Veazey Road to Highway 14 east of Abbeville.

While these improvements will be of greatest benefit to business and industry, they will relieve the downtown business area of unnecessary commercial traffic. In turn, the old town business district can be preserved, making Abbeville a more desirable residential and tourest area.

Since our state constitution now provides monies dedicated to the highway system, these proposals can become realities. Your immediate attention and support is requested.

Sincerely yours,

Sawyer R. White

Sawyer White, Chairman
Republican PEC
1220 S. Henry St.
Abbeville, LA 70510

TO EXAMINE THE FUTURE OF OUR NATION'S INFRASTRUCTURE NEEDS

TUESDAY, AUGUST 7, 1990

House of Representatives,
Committee on Public Works and Transportation,
Victoria, TX.

The Committee met, pursuant to call at 9:04 a.m. in the Electric Co-op Building, 102 South Ben Jordan, Victoria, Texas, Hon. Glenn Anderson (Chairman of the Committee), presiding.

Present: Representatives Anderson, Laughlin and Hancock.

The Chairman. Good morning. The Committee on Public Works and Transportation Hearing on the future of our Nation's Infrastructure Needs will come to order.

I am especially pleased to be here in the great State of Texas and enjoying your community's gracious hospitality. I can clearly understand why my friend and colleague, your esteemed Congressman Greg Laughlin, looks forward to the times that he can come home to such warm and friendly people. I can see why his roots would run deep here.

I also would like to recognize our colleague Congressman Mel Hancock from the Seventh Congressional District of Missouri.

I want to welcome each of you here today and thank you for taking time from your busy schedules to share with us your concerns, knowledge and perspectives about your local infrastructure situation.

The immensity of our infrastructure problems and the fact that we are in Texas looking for solutions reminds me of a story I heard not long ago. It seems a group of Texans were visiting Niagara Falls and he said, I bet you do not have anything like this in Texas, the tour guide teased; well, no, agreed one of the Texans, but we sure have plumbers who could fix it. [Laughter.]

I also want to point out that the immensity of the problems that we are facing in this country is matched only by the talent of the people we have to solve them and Greg Laughlin is one of those talents. He is a dedicated, highly respected and effective member of Congress. I know these may not be the things he would mention about himself, but I can tell you that there is a lot here to brag about. Greg is one of our most energetic members of the Public Works and Transportation Committee and is on all three of our major subcommittees, Surface Transportation, Aviation and Water Resources. Greg has been an important part of legislation coming out of this Committee that will be a tremendous boost to the economy of this area. This is evident through his efforts to secure funding for maintenance dredging of the Victoria and Red Bluff channels. In addition, Greg alerted me and other members of the Committee to the erosion problem at Sargent Beach and the potential disruption of commerce—to commerce on the Gulf Intracoastal Waterway if the erosion was not dealt with immediately. As a result of Greg's work, he was able to secure $690,000 so that that work could begin immediately.

Further, on numerous occasions, Greg has had our aviation specialists and FAA officials working very hard on meeting the needs of your rural airport facilities. I will give him one thing, when it comes to protecting the needs of the Fourteenth Congressional District, Greg does not give up until the job is done.

In holding these hearings in various parts of the country, and in Victoria today, we are focusing on the infrastructure problems encountered at local and state levels. We want to review infrastructure needs with the people most directly involved and to hear a broad range of ideas that can resolve these problems.

As Greg and Mel know, when we talk about infrastructure, we are talking about the very cornerstone of our cities and rural communities. We are talking about one of the most serious challenges facing the American economy. Though infrastructure is not one of our more exciting subjects—nor is it a particularly favorite word—it is, however, crucial in that it provides the foundation for a sound economy and the life blood for the standard of living and quality of life that we all enjoy.

From our infrastructure hearings, we are beginning to see a magnitude in the volume of problems we had not anticipated. We are finding that there is a much higher price to be paid now, and in the future, for having shortchanged our public works investments in the past.

The questions we are working with today in Texas: What shape is your infrastructure in? How adequate is your network of roads and bridges? Are your water supply systems, sewers and wastewater treatment facilities functioning adequately to your needs? Are your public buildings, prisons, dams and facilities being sufficiently maintained?

And as we focus on your infrastructure system in Texas, I would ask you to keep in mind one particular conclusion economists have drawn in recent years; the rate of spending on infrastructure by the public sector is directly related to the growth of productivity in the private sector. Compare what happened between the 1960s and the early 1980s. The rate of public spending on infrastructure slowed by 83 percent and the rate of growth and productivity in the private sector fell by 62 percent. The reduction in infrastructure spending is pulling down productivity.

Now the United States ranks 55th in the world in capital investment. We are behind Canada, France, Italy and the United Kingdom in public works investments, and Japan spends five times more than we do in infrastructure. As a result of their investment, West Germany's annual productivity rate is three times that of our own. America's infrastructure is crumbling beneath our feet and, on a world scale, robbing us of our economic vitality.

In my home, I have a map on the wall of the United States and of the World, but the United States is the center of it and the Pacific Ocean is there because the Pacific is part of my area. Then we see Japan; and I look at Japan and it looks to me like I could put five Japans in California and I suppose I could put 10 of them in Texas. It is just amazing when I look at that to think that not only are they spending more than California, they are spending five times as much as the whole United States. You can hardly believe it, but that is what is happening and that is why their highways and everything else are so much better and that is one of the reasons why they can compete and sell things cheaper than our people can. I think we should know that.

What we have is this: For the the last 20 years, with the demands of a tight budget and inflation, the maintenance of public facilities—essential as they may be to the economy—keep being postponed until tomorrow. Well, tomorrow is here. Now, to determine where we must go, we first must assess where we are. We need to take a serious look at our infrastructure and decide what we intend to do about it.

And as we begin this hearing, I would make one organizational point: Because so many of you have been willing to participate in this hearing and because of time constraints, I am going to ask that you summarize your statements in a two or three minute presentation. You may be sure that your full written statement will be printed in its entirety in the official record of this hearing. Also, any of the witnesses that are going to appear before us, if you have not given copies of your testimony to the Committee clerks, we would like to have you give them a copy.

Okay, let us proceed. First, I would like to recognize Congressman Hancock for any opening remarks that he would like to make.

Mr. Hancock.

Mr. HANCOCK. Thank you very much. Actually, I do not really have any opening statement or opening remarks. I did not know until late Friday afternoon, that I was going to be down here this morning. I would like to compliment you, Mr. Chairman, on your opening remarks. The infrastructure over the whole United States is a major problem. I do not think anybody in this room will question that. We have lots of other problems like the savings and loan crisis and the situation over in the Middle East, but we do have to address the problem of productivity and transportation and communications within this country, if, in fact, we are going to be able to compete.

So, I just thank you for inviting me down to hear at least part of what is happening in the southern part of Texas. I am from the middle west, from Springfield, Missouri and we are very dependent upon our transportation systems and the infrastructure.

Thank you, Mr. Chairman.

The CHAIRMAN. Now, Congressman Laughlin.

Mr. LAUGHLIN. Mr. Chairman, I want to thank you and Congressman Hancock for both coming to the Fourteenth Congressional District. It is an honor to have you here to take a first hand view of listening to people who have first hand knowledge of the infrastructure needs. I would especially thank Congressman Hancock for being here, since he has a primary going on in Missouri today. It is token of his friendship that he is here and I think also a statement of his confidence in the electoral process in Missouri today in that he is going to spend over half the day in the Fourteenth Congressional District. I might note that he does have opposition in the primary. That is where the token word comes in. Mel and I are both confident that it is only token primary opposition.

Our infrastructure is important to our nation and particularly to this region. So, I will keep my remarks brief and, Mr. Chairman, I would ask unanimous consent that my longer formal opening statement be made part of the record.

Today, rather than being the pride of America, our transportation systems are becoming one of its limiting factors, restraining economic growth and opportunity. And as you so ably pointed out in your opening remarks, our competitors in the world market are far ahead of us in their commitment and investment in their infrastructure.

Pointing out a few other things, vehicular miles of travel on our nation's highways has tripled since 1956, from 600 billion to 1.9 trillion miles and they are projected to reach 3.7 trillion miles by the year 2020. In Texas alone, the 14 million registered vehicles travel about 150 billion miles per year. We will be hearing from Arnold Oliver shortly, the Engineer Director, on some of his concerns from his department's viewpoint.

The Gulf coast intracoastal waterway system provides the state's oil and chemical industries direct access to the midwestern markets. According to the Texas Transportation Institute the intracoastal waterway system has a direct economic impact on the State of Texas of 3.1 billion dollars and an indirect impact of 37 billion dollars, employs 127,000 people and contributes 400 million dollars in federal and state taxes.

The needs of Texas are staggering; 3,355 miles of paved rural highway in the State of Texas are rated as deficient under the Federal Highway Administration pavement condition rating system; that is, the pavement is in poor condition and in desperate need of resurfacing, rehabilitation or reconstruction.

Texas has a total of 44,718 bridges of which 14,149—that is 32 percent of our bridges, are either structurally deficient or functionally obsolete.

So, Mr. Chairman, when you consider those factors, our needs for our airports, while they do not measure up to those in Los Angeles or Houston or Dallas/Ft. Worth or New York, our airports, as you will hear, are just as important to rural America.

So in conclusion, Mr. Chairman, I want to thank you for coming to the Fourteenth District, bringing the Public Works and Transportation Committee and staff and Congressman Hancock to hear of our concerns and our needs. In conclusion, I would ask unanimous consent to introduce a letter from Congressman Inhofe to be made a part of the record. Congressman Inhofe from Oklahoma had intended to attend this hearing but he had a conflict that arose that he did not realize was the same day as this hearing. So, he has sent a letter that he asked to be made a part of the record. And also a letter that I have received from the Victoria, Texas Chamber of Commerce.

Thank you very much, Mr. Chairman.

The **Chairman**. No objection, so ordered.

[Mr. Laughlin's prepared statement, the Statement from Representative Inhofe, and the letter from the Victoria Chamber of Commerce follow:]

THE HONORABLE GREG LAUGHLIN
PUBLIC WORKS AND TRANSPORTATION COMMITTEE
AUGUST 7, 1990

MR. CHAIRMAN, THANK YOU FOR THOSE KIND WORDS. IT IS TRULY AN HONOR FOR YOU TO TAKE THE TIME TO VISIT THE 14TH CONGRESSIONAL DISTRICT AND TO LEARN OF OUR INFRASTRUCTURE NEEDS.

I WILL KEEP MY REMARKS BRIEF TO ENSURE EVERYONE HAS A CHANCE TO BE HEARD TODAY.

AS YOU HAVE SO ABLY STATED IN YOUR OPENING REMARKS THE INFRASTRUCTURE NEEDS OF OUR NATION ARE GREAT.

TODAY, RATHER THAN BEING THE PRIDE OF AMERICA, OUR TRANSPORTATION SYSTEMS ARE BECOMING ONE OF ITS LIMITING FACTORS, RESTRAINING ECONOMIC GROWTH AND OPPORTUNITY.

SINCE 1982, THE PRODUCTIVITY GROWTH OF THE U.S. HAS BEEN A DISMAL .7 PERCENT PER-YEAR. HOWEVER, WEST GERMANY HAS EXPERIENCED A 2.9 PERCENT PRODUCTIVITY GROWTH AND JAPAN HAS EXPERIENCED GROWTH OF 3.1 PERCENT.

DURING THIS SAME PERIOD, JAPAN HAS INVESTED ABOUT 5.1 PERCENT OF THEIR PUBLIC INVESTMENTS IN THEIR INFRASTRUCTURE WHILE THE U.S. HAS ONLY INVESTED .3 PERCENT.

THIS DECLINE IN U.S. INVESTMENT COMES DURING A TIME WHEN THE DEMAND ON THE SYSTEM IS EXPECTED TO BE GREAT.

VEHICLE MILES OF TRAVEL ON THE NATION'S HIGHWAYS HAVE TRIPLED SINCE 1956, FROM 600 BILLION TO 1.9 TRILLION MILES AND ARE PROJECTED TO REACH 3.7 TRILLION MILES BY THE YEAR 2020. IN TEXAS ALONE, THE 14 MILLION REGISTERED VEHICLES TRAVEL ABOUT 150 BILLION MILES A YEAR.

THE NUMBER OF PASSENGERS ON COMMERCIAL FLIGHTS HAVE INCREASED FROM 208 MILLION IN 1973 TO 457 MILLION IN 1988 AND IS EXPECTED TO CONTINUE GROWING.

THE GULF COAST INTERCOASTAL WATERWAY PROVIDES THE STATE'S OIL AND CHEMICAL INDUSTRIES DIRECT ACCESS TO MIDWESTERN MARKETS. ACCORDING TO THE TEXAS TRANSPORTATION INSTITUTE THE GIWW HAS A DIRECT ECONOMIC IMPACT ON THE STATE OF $3.1 BILLION, AN INDIRECT IMPACT OF $37 BILLION, EMPLOYS 127,000 PEOPLE AND CONTRIBUTES $400 MILLION IN FEDERAL AND STATE TAXES.

IN ADDITION, ACCORDING TO THE DEPARTMENT OF TRANSPORTATION, OUR NATION WASTES 1.25 BILLION HOURS AND 1.38 BILLION GALLONS OF GASOLINE IN TRAFFIC CONJESTON ON LIMITED ACCESS HIGHWAYS EACH YEAR. BY THE YEAR 2005, THAT WASTE COULD SOUR TO 6.9 BILLION HOURS IN LOST PRODUCTIVITY AND 7.32 BILLION GALLONS OF SQUANDERED FUEL.

IT IS QUITE A SERIOUS CONCERN WHEN YOU CONSIDER THAT IF YOU ARE DELAYED 20 MINUTES EACH DAY IN RUSH HOUR, BY THE END OF YOUR CAREER, YOU WILL HAVE WASTED TWO WORKING YEARS.

THE NEEDS OF TEXAS ARE AS STAGGERING:

- 3,355 MILES OF PAVED RURAL HIGHWAY MILES IN THE STATE ARE RATED AS DEFICIENT UNDER THE FEDERAL HIGHWAY ADMINISTRATION PAVEMENT CONDITIONS RATING SYSTEM; THAT IS, THE PAVEMENT IS IN POOR CONDITION AND IN DESPERATE NEED OF RESURFACING, REHABILITATION, OR RECONSTRUCTION

- TEXAS HAS A TOTAL OF 44,718 BRIDGES, OF WHICH 14,149 (32 PERCENT) ARE EITHER STRUCTURALLY DEFICIENT OR FUNCTIONALLY OBSOLETE.

FUTURE OUTLAYS TO NOT ONLY MAINTAIN THE CURRENT SYSTEM, BUT TO IMPROVE IT TO ACCOMMODATE TRANSPORTATION GROWTH WILL BE STAGGERING. IN FACT, I HAVE HEARD A NUMBER OF ROUGHLY $100 BILLION.

STRANGELY ENOUGH, THE MONEY COLLECTED TO REPAIR OUR NATION'S HIGHWAYS AND BUILD NEEDED ROADS THROUGH A 9-CENT-PER GALLON TAX AND A FIFTEEN CENT PER GALLON DIESEL TAX IS GOING UNSPENT. OVER $19 BILLION SITS IN THE HIGHWAY TRUST FUND WHILE OUR TRANSPORTATION INFRASTRUCTURE IS IN SERIOUS NEED OF REPAIR AND EXPANSION.

WHEN THE HIGHWAY TRUST FUND WAS ESTABLISHED IN 1956, IT WAS CREATED FOR THE SOLE PURPOSE OF FUNDING CONSTRUCTION OF OUR NATION'S INTERSTATE HIGHWAY SYSTEM, NOT OFF-SETTING ACCUMULATING DEBTS OF THE FEDERAL BUDGET. PEOPLE HAVE PAID THESE TAXES WITH THE UNDERSTANDING THAT THEY WILL BE USED TO IMPROVE THEIR ROADS AND BRIDGES. THEY HAVE EVERY RIGHT TO EXPECT THE MONEY WILL BE SPENT AND NOT HELD IN THE TREASURY.

THE SAME CAN BE SAID FOR THE AVIATION TRUST FUND WHICH IS SUPPORTED BY AN 8 PERCENT AIRLINE TICKET TAX, A GENERAL AVIATION FUEL TAX AND OTHER TAXES HAS A SURPLUS OF $7.6 BILLION.

WE MUST INVEST QUICKLY AND WISELY IN OUR TRANSPORTATION NEEDS. TO DO SO, WE MUST TAKE THE HIGHWAY TRUST FUND OFF BUDGET AND RELEASE THESE FUNDS FOR THE PURPOSE THEY WERE INTENDED.

TRANSPORTATION NEEDS AND THE APPROPRIATE SOLUTIONS VARY BY GEOGRAPHIC REGION, BY STATE, BY SIZE AND ECONOMIC STATUS OF JURISDICTION. MOREOVER, THE NEEDS OF A SINGLE COMMUNITY WILL CHANGE OVER TIME. WHAT WAS A TOP PRIORITY NOW MAY NOT BE A TOP PRIORITY IN FIVE OR TEN YEARS. THIS MEANS THAT MAXIMUM FLEXIBILITY IS IMPORTANT IN FEDERAL PROGRAMS.

YOU CAN BE SURE THAT I WILL BE WORKING DELIGENTLY WITH CHAIRMAN ANDERSON TO MEET THE CHALLANGES WE FACE TOMORROW.

AGAIN, THANK YOU MR. CHAIRMAN AND I LOOK FORWARD TO TODAYS HEARING.

U. S. Hou[illegible] of Representatives
414 CHOB
Washington, D. C. 20515

Dear Greg:

I regret that I will be unable to attend your infrastructure hearing on Tuesday, August 7th. I could have attended had it been Wednesday, as I originally thought, but as you know I am speaking to a national group on Tuesday.

Of course, I am familiar with your part of the country inasmuch as I used to develop in south Texas. Therefore, It would have been enjoyable, as well as productive. Our part of the United States has been undergoing a deterioration of infrastructure for a number of decades and I believe these hearings are most worthwile in bringing Federal attention into our districts. As a matter of fact, I am hoping to have one in my district on August 30th and I hope you will be able to come.

In the meantime, best of luck for a successful hearing.

Sincerely,

Jim

James M. Inhofe

THIS STATIONERY PRINTED ON PAPER MADE OF RECYCLED FIBERS

Victoria
CHAMBER OF COMMERCE
700 MAIN CENTER, SUITE 101

August 6, 1990

The Honorable Greg Laughlin
United States House of Representatives
Washington, D. C. 20515

Dear Congressman Laughlin:

The Victoria Chamber of Commerce Transportation Committee appreciates the opportunity you have provided us in submitting our concerns on the transportation needs of our area. We applaud your efforts in arranging for the Public Works Committee hearing in Victoria for this purpose and respectfully submit the following transportation concerns.

Highway Transportation: Our committee recognizes the major role that good highways play in the economic well-being of our region, state and nation. We also recognize that major traffic routes served by two-lane highways fall short of meeting the safe and efficient traffic needs of an expanding economy. Businesses tend to locate and expand more rapidly in areas served by four-lane divided highways.

In the Crossroads Area, our committee believes several of our major traffic routes currently served by two-lane highways need to be expanded to four-lane highways. Not only is this important to our economic growth, but of major importance in the safe evacuation of citizens from the Gulf coast when a hurricane hits our area of the state. Our priorities in providing for four-lane highways are as follows:

1. Highway 77 north from Victoria to Waco: This highway is currently a major route for Winter Texans going to the Rio Grande Valley, for businesses sending and receiving goods from North and Central Texas and for citizens evacuation in the event of a hurricane.

2. Highway 87 from Port Lavaca to San Antonio: This highway is a major traffic route for businesses to and from the Crossroads area to San Antonio and West Texas. It is also used as a major evacuation route.

3. Highway 59 from Laredo to Houston: The Republic of Mexico has under development a super highway expansion from Monterrey, Mexico to Nuevo Laredo with a new bridge crossing to Laredo, Texas. Because Laredo is a major center for imports into Texas, this route is of major importance in transportation between Laredo and the Port of Houston.

P.O. Box 2465 • Victoria, Texas 77902 • (512) 573-5277 • FAX (512) 573-5911
ACCREDITED

Victoria Barge Canal: The deepening and widening of the 36 mile Victoria Barge Canal to a depth of 12 feet and a width of 125 feet is of utmost importance. This will provide for larger ocean going barges to move directly up the canal and thus add to the efficiency of business operation. This in turn, will enhance the ability of businesses which use the canal to compete in an international market.

Victoria Regional Airport: Airports are obviously important to any area of the state or nation. The Victoria Regional Airport, as the name implies, serves a seven plus county area. Funds are needed to build a new terminal building to replace the existing structure which is approximately 50 years old.

With increased economic growth expected in the Crossroads area with the expansion of such facilities as the Formosa Plant at Point Comfort, continued attention must be given to the airport to insure it meets the needs of the region. With this expected growth the airport must have proper funding to meet the increased traffic needs of the region.

If you wish further information regarding our committee's concerns on highways, the Victoria Barge Canal or the Victoria Regional Airport, please feel free to contact myself or Robert C. Martin, President, Victoria Chamber of Commerce.

Sincerely,

Harold Cobler

Harold Cobler
Victoria Chamber of Commerce
Transportation Committee Chairperson

HC/tb

The **Chairman**. Mr. Laughlin, Would you like to introduce our first panel?

Mr. **Laughlin**. In the first panel will be Mr. Arnold Oliver, Engineer Director, State Department of Highways and Public Transportation from Austin and Colonel Brink Miller, Corps of Engineers, Galveston Division, Galveston, Texas. Colonel Miller and Mr. Oliver, if you will come forward and if you have staff that is going to accompany you, they can sit on either side. Mr. Arnold, they have got you a name tag set up. If you will sit at the far left and, Colonel Miller, if you will sit to his immediate left.

TESTIMONY OF ARNOLD W. OLIVER, ENGINEER DIRECTOR, STATE DEPARTMENT OF HIGHWAYS AND PUBLIC TRANSPORTATION, AUSTIN, TX AND COL. BRINK P. MILLER, CORPS OF ENGINEERS, GALVESTON DIVISION, GALVESTON, TX

Mr. **Oliver**. Good morning, Mr. Chairman, Congressman Hancock and Congressman Laughlin. We appreciate the opportunity to be here. We are also very appreciative of the interest that Congressman Laughlin has taken in the transportation system in the State of Texas. We recognize that Congressman Laughlin and the other members of your committee have provided over the years a tremendous amount of support for not only Texas but the entire nation.

I want to thank the Committee this morning for giving us Texans an opportunity to talk with you this morning about our infrastructure accomplishments and some of our needs. I am here today to highlight the highway and bridge issues primarily that we believe are particularly important to Texas.

Today Texas has a population of approximately 16 million people and we expect that to reach a population of about 20 million during the next decade.

To serve this population base we have the largest highway system in the country, about 305,000 miles of public highways. We have about 14 million registered vehicles. As Congressman Laughlin pointed out, that is approximately one vehicle for every Texan in the state. Our highways carry about 150 billion miles of highway travel annually.

We have as many miles of farm-to-market roads, approximately 43,000 miles, as there are miles of interstate system in the entire United States. The future of South Texas, as well as that of many rural areas of Texas rides on this farm-to-market road system. The people and products that move on this system bring the American values of mobility and economic prosperity to not only millions of Texans but others in the country.

As Congressman Laughlin pointed out, we also have more bridges, approximately 45,000, than any other state in the country. Many of our rural areas are crisscrossed with rivers, creeks and streams. Even in arid West Texas, we have bridge problems. Many areas flood during heavy rainfall. Too many of these bridges, particularly on local roadways, have deteriorated or are obsolete.

During the past several years, we have made travel on Texas highways safer than ever before. In 1970, 5.2 people died for every 100 million miles driven in Texas. In 20 years, in 1989, that rate had fallen by 60 percent to 2.1 people for every 100 million miles. Now, we have been very pleased to note the Federal Highway Administration's increased emphasis on safety in developing its highway reauthorization proposal which has been presented to Congress. We agree with the Federal Highway Administration that safety aspects of highway decisions must be timely, appropriate and must be fully integrated into the project development process.

In Texas, the shift from agricultural industry to maquilladora or twin plant industry in the Rio Grande Valley demonstrates the national imperative of Texas highways. Federal assistance must continue. That assistance has to reach out beyond today's interstate highway system. Texans must also receive a fairer return on their federal highway dollar than we have before. Today, we receive approximately one billion dollars a year in highway funding, which represents about 80 percent of our federal user fee payments into the highway trust fund, but only about a third of the department's annual budget. And our total funding from all sources, state and federal, will cover only about 60 percent of the identified needs in Texas.

We agree with the American Association of State Highway and Transportation officials that the first federal priority ought to be to preserve the highway system that we currently have. To replace our 77,000 centerline miles of state maintained network would take almost 100 billion dollars. So, we cannot afford to allow this system to deteriorate to the point of having to start from scratch.

To better enable us to meet the challenge facing us, we must have a simpler, more flexible federal program. The underlying responsibilities of the federal government for national defense, interstate and international commerce, and the safety and mobility of our people must shape the federal role in transportation. However, federal involvement should support and not inhibit the unique creativity and expertise that marks each of the states in this country. Federal red tape should not keep our roads and bridges from being upgraded.

In this light, we join the American Association of State Highway and Transportation officials in recommending a two-part program structure; a categorical or focused program and a flexible program for both highways and public transportation. This two-part structure would continue to address national needs, but would also allow states the flexibility to determine and address local needs. This plan would allow our state highway agencies the flexibility necessary to determine the best use of limited resources to preserve and expand our national and our local transportation infrastructure.

There are many other issues that, of course, are affecting highways and bridges in Texas which need to be discussed, but we believe that those we have raised before you this morning are the major issues of concern to rural Texas.

In conclusion, I want once again to thank the Committee for the opportunity to appear and present this testimony. Thank you very much.

The **Chairman**. Colonel Miller.

Mr. Chairman, Mr. Laughlin, Mr. Hancock, I am pleased to be here today to represent the Department of the Army and specifically the Galveston District of the Army's Corps of Engineers before this Committee to talk about the Corps' interest, pursuant to its civil works mission, in the nation's infrastructure.

Throughout the nation's history, as you know, the Corps of Engineers has actively participated in planning, design, construction, operation and maintenance of various aspects of the nation's infrastructure. Through our civil works program, the Corps has been engaged in the construction of waterways and harbors, flood control projects and large multiple-purpose dams. The Corps' military missions have resulted in the construction of large military facilities and bases, including the associated infrastructure that goes with those bases, housing, roads, water supply, waste treatment plants and solid waste disposal facilities.

During the 1980s, a number of studies were conducted by various organizations that focused on the long-term operation, maintenance and rehabilitation costs that our nation's infrastructure system would place on the shoulders of future generations. A report by the National Council on Public Works Improvement entitled "Fragile Foundations", confirmed what most of us believed from personal observation; that is, that the nation needs to develop solutions today to rebuild its infrastructure with systems which promise reduced financial burdens for the future. The council concluded among other things that the Water Resources Development Act of 1986 which made cost sharing mandatory for many types of water projects, would improve both project selection and reduce overall project costs. We in the Corps of Engineers concur with this conclusion and believe that the principle of cost sharing is important in maintaining our program's credibility.

We in the Corps share this Committee's concern for the future of the infrastructure, both those for which we have responsibility and for the rest of the infrastructure of the nation. Many of the nation's large metropolitan areas are experiencing critical transportation and flooding problems. For example, just in the city of Houston, which is in my district and for which I have responsibility, we have ongoing right now in various stages of planning, design or construction nine flood control projects. We have just gone out for bids to resume construction of the Wallaceville Reservoir project which will help alleviate the water supply problems in the City of Houston. We hope to begin construction in 1992 on the channel to Victoria to assist in the waterway to this location.

Additional new facilities are needed to accommodate future growth. At the same time, facilities that are in place, which must continue to function, are deteriorating and many are in need of major rehabilitation or replacement. The needs are great and the resources are limited; thus, there is a pressing need for establishing priorities for needed repairs and new facilities. Of course, the setting of these priorities will be no small task since the process will be complicated by the diversity of critical infrastructure needs competing for these resources. These needs include facilities for transportation, flood control, solid waste disposal, wastewater treatment, water supply and energy generation.

Now, on the local level, the Texas Gulf Coast also faces hazardous and toxic waste problems and serious erosion problems which also require resources. Additionally, the vital Gulf Intracoastal Waterway—as you mentioned in your opening remarks, Mr. Chairman, that link the Texas ports with the rest of the nation is in serious need of repair and modernization. Currently the Galveston District has embarked upon a review and evaluation of the infrastructure needs with recommendations to be forthcoming to the Assistant Secretary of the Army for Civil Works. So far, we have identified two immediate and critical needs. One involves a serious threat to the integrity of the waterway caused by accelerated erosion in the Sargent Beach area that threatens a seven mile breach of the waterway. The other identified need concerns the serious erosion problem that threatens the Aransas National Wildlife Refuge, the only winter habitat of the endangered whooping crane.

The Corps of Engineers stands ready to support the future federal role in solving the nation's infrastructure problem. Given the size and nature of these problems, there must be a vigorous pursuit of solutions. Not only must we use existing programs effectively, but we must establish new and creative approaches for effective partnerships between federal, state and local governments and the private sector. Having effective partnerships is not new to us in the Corps. In the Galveston District, for example, we presently have numerous design and construction tasks involving the state, cities, counties, navigation and flood control districts, port authorities, the U.S. Navy and the Maritime Administration of the Department of Transportation.

In summary, the Corps pledges its support and looks forward to continuing to work with the Congress, federal agencies, local governments and the private sector to accommodate our infrastructure needs.

Mr. Chairman, this concludes my statement. I would be pleased to address any questions.

The CHAIRMAN. Okay, I will start off with the first one for Colonel Miller. How would a breach in the Gulf Intracoastal Waterway, at Sargent Beach for instance, affect commerce and in a response plan, will you be working with local officials beforehand to take care of their concerns on how this would affect the local economy?

Colonel MILLER. Yes, sir. Right now the section of the beach that we are talking about is separated from—I am sorry, the Gulf Intracoastal Waterway at the location we are talking about is separated from the Gulf of Mexico by less than 600 feet and it is for a stretch of about seven miles. That particular portion of the beach is eroding at somewhere between 30 and 50 feet per year, which means that we have very little time left before the Gulf Intracoastal Waterway becomes the Gulf of Mexico along that stretch, which then would stop shallow draft transportation through that stretch of the waterway. The Gulf Intracoastal Waterway would no longer exist at that location. There are about 17 million tons of traffic that traverses that particular stretch of the waterway each year. That is a tremendous economic benefit to the nation and to, of course, those ports and industries along the Texas coastline. So, a breach of the waterway essentially says that transportation can no longer move along the waterway and needs to move some other way if it is going to move. That means either plants will close along those locations, and particularly south of that location, or alternate transportation means would be necessary. It would have to go by rail; it would have to go by road and the infrastructure does not exist to carry those quantities off traffic. We are talking like 600,000 rail cars. It is just more than the nation can handle.

The CHAIRMAN. Thank you, Colonel.

Colonel MILLER. Excuse me, sir. You also asked are we working with local officials. We certainly are. We have completed the reconnaissance phase of that study. We are accelerating the feasibility phase and hope to begin construction on a solution to that problem in 1994.

The CHAIRMAN. I suppose it is important to know how to work with the local officials to take care of their concerns because this could affect the local economy.

Colonel MILLER. Yes, sir, absolutely. And they are very much a party to the work that we are doing with respect to solving that particular problem.

The CHAIRMAN. Mr. Oliver, you talked mostly about highways and one thing you said kind of interested me. You said, we must have a simpler, more flexible federal program. Can you tell me what you are thinking of? How can you have a simpler, more flexible federal program?

Mr. OLIVER. Yes, sir, I think so. At the current time, we receive federal funding for highways in about 34 different categories of funding. Most of these categories have very tight, very strict regulations as to how this money can be used, the qualifications for the projects for which these monies can be used. Often times the restrictions on these particular categories do not allow the flexibility of the state to address the real needs of that state. These categories are determined from a national standpoint and they may or may not be pertinent to a lot of the local needs. And the paper work and the time involved in this is, we feel, in our opinion, is restrictive. We think that a much simpler, more flexible program would allow the states to carry out the national interest on a system of highways of national significance, as well as be able to address in a more timely manner the local needs for local areas.

The CHAIRMAN. It is your turn, Greg.

Mr. LAUGHLIN. Thank you, Mr. Chairman.

Arnold, I want to compliment you and the very fine staff that we in Texas have at the Department of Highways and Transportation. I want to thank you for the very competent, courteous manner in while you all work with me, both here in Texas and your trips to Washington to sell the needs of our infrastructure here in Texas. But, I must ask you, hearing so much about the congestion problems in the urban areas, what has our department in Austin done to insure that we in rural Texas have quality transportation—road transportation available for us?

Mr. OLIVER. Of course, our former Highway Commissioner, Mr. Robert Lanier who was chairman of our Commission several years ago, made the statement that unless we solve the problems of urban areas in Texas, that the economy of Texas will soon become stagnant. So in response to that, we have been concentrating a great deal of our resources on solving the congestion problems in the urban areas. We have recently however begun an effort in the State of Texas to develop what we call the Texas trunk system, which is a network of rural highways in the state which will be developed to a standard of four lane, divided, or better. It would include the interstate system. It would be a system of approximately 11,500 miles in size and it would, as I say, primarily serve the rural interest by connecting our major urban centers, our ports of entry, our defense establishments, to provide an overall system of highways in Texas that we feel would adequately serve the needs of the entire state. Our hope is that should the new reauthorization bill in Congress adopt the proposed AASHTO method of a system of highways of national significance, that hopefully this system will fit very neatly into that and would be basically our definition of our portion of the federal system of national significance.

Mr. LAUGHLIN. Can you tell us what local input from officials your department has sought in developing the trunk system and if you have added or deleted roads on the basis of that input?

Mr. OLIVER. We initially developed a system of roads on this trunk system of approximately 9,000 miles. At that time, we went out across the state and had a series of 10 public hearings in various regions of the state to receive input from the public on what roads they would like to see on this system. After making this series of 10 public meetings, we took the hearing data, digested it, modified the system and added about another 1,200 miles to that and then we recently in Austin had another public hearing, statewide public hearing to receive input on the revised map. Now, we are in the process of taking that hearing input and probably adding some more to that system based on the comments that were given at that hearing. So probably, our final system is going to wind up somewhere around 11,000 and 11,500 miles.

Mr. LAUGHLIN. Thank you.

Colonel Miller, I have to thank you and your staff because it seems like every week I call with some problem on the Intracoastal Waterway System or one of the canal systems, or something going on. You all have been very responsive to the inquiries that either I have made or my staff has made. You have been in touch a great deal and are very familiar with the problems that we have and I appreciate your support on the Victoria Barge Canal and on the erosion problems that we are experiencing on the Gulf Intracoastal Waterway System. I would like to follow up on a conversation we had some time ago about the erosion. It has been suggested by several people from the 14th District that we look at using dredge material, that was clean, as nourishment. I wonder if you can give us a quick, short report on where we are on using clean dredge material for nourishment of our erosion—areas that are eroding?

Colonel MILLER. Yes, sir. Obviously the use of dredge material in beneficial ways is the best thing to do with dredge material. It can be used as a resource rather than something you have to put somewhere to get rid of it. The only problem with using dredge material to nourish beaches is that you need beach quality material in order to do that. In general, the material that comes out of the Gulf Intracoastal Waterway is not beach quality material. It is not sand. It is silt and that material is not effective in nourishing beaches. There are seven outlets along the Texas Gulf Coast that have outlets into the Gulf of Mexico that have various qualities of sand that can be used for nourishing beaches and where that sand is good quality, then, yes, we use that material to nourish beaches. I do not think that is the solution to the Sargent Beach problem. I do not think that any material we put along the Sargent Beach area would stay there. So, I guess, the bottom line is that the solution that we are looking at to solve the erosion problem at Sargent Beach is a structural solution. Now, we will build a protective wall of some kind.

Mr. LAUGHLIN. I understood that part. I just want to go beyond that because there has been a great deal of discussion, all up and down the coastline, about what do we do with dredge material and that has been one of the suggested uses.

Colonel MILLER. Yes, sir. And, as I say, there are—there are outlets to the Gulf of Mexico where we do dredging that the sand—or the dredge material there is beach quality material and where we find that, we will make every attempt to that on the beaches.

Mr. LAUGHLIN. That is all the questions that I have. Thank you, Mr. Chairman.

The CHAIRMAN. Congressman Mel Hancock.

Mr. HANCOCK. I do not really have a question but I would like to make a statement, especially for Mr. Oliver. I, for one, and I think Greg and the Chairman, also, we are working extremely hard on trying to get the highway trust funds released. I figure that this audience will probably be interested in that, too. If we get that done, that would go a long way toward at least starting on the problem.

Mr. OLIVER. I agree with you.

Mr. HANCOCK. That is all I have to say, Mr. Chairman.

The CHAIRMAN. Thank you very much.

Mr. LAUGHLIN. Our next panel will be Mr. Patrick Rhodes, Airport manager, Victoria Regional Airport, Mr. Hartley Sappington, Director of Community Development in Georgetown, accompanied by Travis McLean, Airport Manager at Georgetown Airport and Mr. Bob Hart, City Manager of Georgetown. Also a member of the panel is Mr. Doug Baker, Airport Manager, Brenham Airport, Brenham, Texas; Mr. Eugene Johnson, Airport Manager, Aransas County Airport, Rockport; Mr. Bill Blackwell, representing the Cuero Airport and Mr. Charles Williams, Airport Manager, Bay City Airport. I have just been handed a note that Mr. Doug Baker from Brenham has not arrived, so if he does, we will catch him later in the hearing process. Let us just begin and go in the order that we have on the list. Pat Rhodes, if you will begin, we will hear from your first.

TESTIMONY OF PATRICK RHODES, AIRPORT MANAGER, VICTORIA REGIONAL AIRPORT, VICTORIA, TX; HARTLEY SAPPINGTON, DIRECTOR OF COMMUNITY DEVELOPMENT, GEORGETOWN, TX; EUGENE JOHNSON, AIRPORT MANAGER, ARANSAS COUNTY AIRPORT, ROCKPORT, TX; BILL BLACKWELL, REPRESENTING CUERO AIRPORT, CUERO, TX; AND CHARLES WILLIAMS, AIRPORT MANAGER, BAY CITY AIRPORT, BAY CITY, TX

Mr. RHODES. I certainly appreciate the opportunity to come and talk to you about the Victoria Regional Airport and its role in the transportation infrastructure in this area.

I would like to follow Mr. Anderson's lead on capital improvements or capital expenditures and just highlight some of the things that I have submitted to you in my written report.

In the five-year capital improvements program that this airport presently has on file with the FAA, we have several projects, including building a new terminal building for commercial air travel, improving the ramp and taxiway areas, rehabilitation of two of our runways, working on our underground drainage system and installing new taxiway lighting cable and also upgrading our instrument landing system.

If I could take some time to emphasize some of these points. First of all, as an overview, this facility is a surplus military base. It was deeded to the county in 1961 and there has been very little capital improvement done since then if you look at the overall scale of things.

The terminal building that we are presently using was constructed in 1952 and designated as a semi-permanent structure. It has served us well but we have outgrown it. As an example, in 1987, we boarded 11,410 passengers; in 1989, we boarded 19,592 and my projections for this year is that we should exceed 24,000.

As we all know, one of the emphasis items in aviation today is the security of civil aviation. In the FAA advisory circular that defines the space needs for screening and departure areas for nonhub airports, they recommend you have 650 square feet for passenger loading, we have 240.

Our ramps and taxiways were built either in 1942 or 1952, depending on which areas we are talking about. We have been able to upgrade two of our runways in the last three years—I am sorry, the last five years. And the other two runways are in reasonably good shape, particularly considering their age.

On our underground drainage system, it is still functional but it has been in the ground for at least 35 years and most of it longer than that. Some of our taxiway lighting cables were installed by the Air Force prior to abandoning the facility.

All of these items are things that we can accomplish and that we are working on and that is with the assumption that the Airport Improvement Grant Program continues to be funded and continues to apply to this size of an airport.

In summary, each of our capital needs requires significant capital outlay. This capital requirement makes a continuation of enplanement entitlements through AIP as central to the continued growth and success of this airport. Although most conversations concerning the Passenger Facilities Charges centers around large hub airports, they are important to all airports, including this one. Your support of these valuable revenue sources is essential to the future of Victoria Regional Airport, and we certainly appreciate it.

I thank you for your time.

Mr. LAUGHLIN. Thank you.

Hartley, if you will proceed.

[The prepared statement of Mr. Rhodes appears on p. 890.]

Mr. SAPPINGTON. Mr. Chairman and members of the Committee, the City of Georgetown is pleased to be presenting to the Full Committee on Public Works and Transportation of the U.S. House of Representatives in its regional hearing on the future of our nation's infrastructure needs. The need for replacement, expansion and upgrading of the current and future public works infrastructures is of high priority at every level of government and must be dealt with in view of government's funding for all services.

Today, we wish to speak to the Committee on a user fee funded government operation that is of vital concern to all communities and states—airports—particularly business services airports.

While the nation's scheduled air carrier airports are the most visible component of the United States air transportation system, the majority of aircraft operations take place at smaller airports that serve the general aviation component. These airports make up over 80 percent of the airports in the National Plan of Integrated Airport Systems and over 90 percent of the facilities in the Texas Aeronautical Facilities Plan. The objective of these plans is to direct federal and state resources to airports which best support the Plan's goals of increasing system capacity, providing safe access by air to centers of population, industry, agriculture and natural resource development and fostering economic development.

In the past, small airports, such as Georgetown Municipal Airport, were considered recreational flying airports, but today these airports are considered key economic development factors for a community. It is recognized by the states' business and government leaders that the economy of Texas is in transition and the general aviation system will play a strong role in support of the transition.

The City of Georgetown is committed to continue to encourage diversified economic growth in the community and recognizes that a key factor to this growth is its airport. The economic development growth may hinge on the airport being able to respond to these growth needs as they are presented. These needs include safe runway approach areas, adequate runway lengths and up-to-date communication and guidance systems.

Since 1987, the City with Airport Improvement Grant funds from the FAA has totally reconstructed the main runway, constructed an additional 20,000 square yards of aircraft parking apron, the main taxiways have received an asphalt overlay, aircraft run-up ramps have been constructed at each end of the main runway and clear zones have been purchased to protect the approaches to both runways. The FAA funds have amounted to 1.3 million dollars and City funds to $128,000.

In addition, the City has funded entirely the installation of a jet fuel dispensing system, completely upgraded the av-gas fuel dispensing system, installed new property line fences, cleared three acres of newly acquired clear zones, constructed an auto parking area adjacent to the Terminal Building and repaired the access ramps to a city owned commercial hangar at a total cost of $65,000.

The City is currently working with the FAA and the Texas Department of Aviation to extend the main runway 900 feet to the south; from 4,100 feet to 5,000 feet in length. This project will ensure the continued safe operation of the airport and is an important step in the City's economic development program. The City will receive a $600,000 FAA grant in the current fiscal year for the first year of a projected three-year program of this project. We urge the Committee to favorably consider the continued funding of this 2.7 million dollar project.

In addition to the runway extension, the City has submitted a pre-application for federal funds to the FAA for the following projects:

A. Installation of a partial instrument landing system consisting of a localizer and marker beacon;

B. Installation of deer-proof fences at the airport; and,

C. Reconstruct the center 75 feet of the cross-wind runway.

Each of these projects is considered extremely important to the continued safe and efficient operation of the airport. We ask that the Committee continue funding the FAA Airport Improvement Program to the fullest extent possible in order that small airports like Georgetown Municipal will be able to continue to receive the funding that is essential to their ability to meet the demands of the state's air transportation system.

Mr. LAUGHLIN. Thank you, Hartley.

Gene, if you will proceed.

Mr. JOHNSON. Good morning, Mr. Chairman, Congressman Laughlin and Congressman Hancock.

The future of our nation's transportation system is closely interwoven with the General Aviation Airport System and one cannot survive without the other. All future planning and development of our nation's Air Transportation System must include large and small general aviation airports and the communities they serve.

The development of the finest aeronautical system available, should be the goal for our country. It will require a concentrated effort by state, local and federal government to achieve; however, it is a realistic goal.

The economic strength and future growth in Texas and the nation is dependent on new and expanded businesses. Today, more than ever before, stable business growth relies on fast and efficient transportation. The market place of tomorrow will demand almost immediate transport of high priority business people and products. Recreational travelers who have limited time and distant travel goals, also need rapid transportation options. Air travel is the one method of rapid transportation that is already in place and ready to be expanded.

To ensure continued growth of our general aviation airports in the future, two major problems need to be addressed. Legislation introduced to lessen and limit the product liability of manufacturers of aircraft, aircraft parts and accessories. The lack of any control has caused the price of aircraft parts and new manufacture to rise beyond a marketable price, eliminating most manufacturers of single engine aircraft. If any change is to be effected this issue must be addressed and a solution found.

Increased improvements in facilities and navigation aids at business class and smaller airports. The present system of funding through the AIP program seems to be directed to the larger commercial service airports, which are much more able to support themselves through many varied resources. We cannot allow our smaller airports to deteriorate while the AIP fund has tens of millions not being spent. The method currently in place for selecting and placing of navigation aids really seems to be a Catch-22 arrangement, as the need for improvements is based on the number of actual instrument approaches filed and flown; however, if a minimal system is in place, few pilots bother to file an instrument approach to your airport. This needs to be redefined to a more realistic system that will allow growth at smaller facilities.

I do sincerely thank you for this opportunity to present my views on the needs for general aviation in the future.

Mr. LAUGHLIN. Thank you, Gene.

Bill, if you will proceed.

Chairman Anderson, I appreciate the opportunity to appear before you and your committee this morning in regard to the infrastructure needs in Congressman Greg Laughlin's 14th Congressional District.

I would like to make two separate statements, one on airports and one on highways.

First, the DeWitt County Airport Development Committee has requested an airport improvement program study. There is only one airport in DeWitt County, located in Cuero, the county seat. The airport is only 1,800 feet long and the possibility of expansion is limited because of its location between State Highway 87 on one end and the Southern Pacific Railroad on the other.

The federal assistance grant to conduct the study was approved by the Golden Crescent Regional Planning Commission board of directors in 1985. The DeWitt County Commissioner's Court sponsored the application, along with the cities of Cuero, Yoakum and Yorktown. Part of our problem is the "cart before the horse" philosophy. Our airport is too small for everything except the smallest of planes and we are unable to show we need a larger airport because the traffic is low on our current airport.

The FAA has told the Texas Department of Aviation that it is unlikely that they will fund the project due to the low activity levels at Cuero Municipal Airport. If we cannot get a new airport, we may even have a bigger problem as Cuero Municipal Airport may be shut down if funding is not provided for repairs and upgrading according to the Texas Aeronautic Commission.

The survey on airport needs would document how much a new field with a longer runway would be used. The survey would also attempt to document the loss of companies that choose not to locate in the county because of inadequate airport facilities. This could be a significant factor in reviving our local economy.

Second, I serve on the Long Range Planning Committee of the Guadalupe-Blanco River Authority Board of Directors. As part of our project, we are looking into population projections and the water needs for this area for the next 50 years.

Because of this study, I feel state highway 183 from Cuero to Austin is being overlooked on the recently announced Texas Highway Trunk System. Victoria, Port Lavaca and the access of the coast from our state capital would be greatly enhanced.

This concludes my remarks.

Mr. LAUGHLIN. Thank you, Bill.

Charles, if you will proceed.

Mr. WILLIAMS. Good morning, Chairman Anderson, and both Congressmen. I am here to speak to you on general aviation and how it is important to the Gulf Coast region.

I think the economy of Texas has undergone a change in the past ten years and it has gone from real good to real bad and all of us in general aviation has suffered from this. Our airports have seen a reduction in traffic, fuel sales, rentals and aircraft sales. The oil and gas industry, the savings and loan downfall and a job shortage have all been factors in this program. Now, I think we can see a little improvement and maybe a light at the end of the tunnel.

I believe the economy is starting to make a swing towards improving and I can see it at my airport and also in the City of Bay City. Fuel sales are increasing, hangar rentals are up and student activity is increasing in our airport. With this small improvement to our economy, we have to look to the future and be prepared. We have to have our airports upgraded to meet the traffic because when the economy gets good again, general aviation will get good again. General aviation will transport people for recreation, as well as industry. The petrochemical, plastic, oil and gas, farming and seafood industry will benefit from general aviation.

I am more familiar with the region I live in on the Gulf Coast area between Galveston and Corpus Christi. I think it is some of the least developed part of the Texas Gulf Coast. This part of the coast is important to most of us in this room and I believe it will be the next big boom area of the Gulf Coast. I believe that our part of the region is a prime area because of the jetty project at the mouth of the Colorado River, the South Texas nuclear project and also state highway 35 which comes within three miles of the airport and through Bay City which is a major thoroughfare down the coast.

The jetty project and the development of the Colorado River from the mouth to the port of Bay City will open up an offshore fishing and shrimping industry for our area.

Also, the barge traffic up the Colorado River will increase the prospects of industry along the river from Matagorda to Bay City. The South Texas nuclear project will also attract all kinds of industry with the ready supply of power for these people's use.

We have already seen the effects of this growth through inquiries that we receive at our chamber of commerce. K-Mart, HEB, Wal-Mart and Sutherland Lumber Company have just expanded their businesses in Bay City and all of them use the airport. With new and expected growth, we must look forward and have our airport ready. We must attract business to our airport and our community. With this growth and added business, general aviation will play a very important role.

General aviation can become a viable source of income for your local economy.

Thank you.

[The prepared statement of Mr. Williams appears on p. 893.]

The CHAIRMAN. My first question is; particularly from a rural aviation viewpoint, I would be interested to know more about the role that you play in the community's economic revitalization efforts. Is there a consultation and an active exchange among all parties involved?

Mr. SAPPINGTON. Mr. Chairman, I believe there is a quite active conversation going on between the local government, the business community, that is, in the rural communities, as well as the economic development entities that are going out and recruiting business that has come in. Often a key question that comes up is what type of air facilities are available to our corporation if we establish a plant in your community. So, I think there are a lot of conversations going on in that regard.

The **Chairman**. So you would be involved in discussions when you mentioned earlier that each end of your airport was blocked by a railroad or a highway and you would be involved with these people in discussing what their possible solutions might be and so on?

Mr. **Sappington**. Yes. I think it would be a very aggressive discussion going on to look for alternative sites to present to the FAA as to viable options. This is not occurring in my community but I think if that was the case, I would be.

The **Chairman**. Greg.

Mr. **Laughlin**. Thank you, Mr. Chairman. I do not have any questions but I do want to tell each of you that I have got a letter report addressed to me from Jim Oberstar, Chairman of the Aviation Committee that addresses many of the things that you have been in contact with me about that we have discussed in the past. I just received it, so if you will see Jim Greenwood over here on my staff, if we do not have enough copies, I will certainly get it mailed to you.

Mr. Chairman, I will tell you first hand that going into the Cuero airport takes an act of courage or desperation and my only experience of going in there is one of ignorance. [Laughter.]

I had my then seven year old son in the plane with me and the pilot was a former jet pilot or I do not believe we would have made it in there. I was glad that we made it in and made it out. I found out later while talking to my good friend Bill Blackwell that twin engine planes cannot take off with a full load out of that airport and I am glad the weather was good the day I was in there with my son and had a hot shot pilot that knew how to take those kind of jet pilot takeoffs that are necessary.

Bill, you were right out front. We are going to be able to get some study money, I think, to help Cuero in alleviating the Catch-22 problem that you are in. You have an airport that planes cannot land in and the other group is telling you, we cannot even help you because you do not have enough air traffic. Now, if they will go out and get a bunch of suicidal pilots, I know that you all can get that rate up, but I will not be on one of those planes.

I can tell you that as to your 183 inquiry, just two weeks ago in Washington when David Swallow from Arnold Oliver's staff was there checking with members of Congress from Texas on things that we see are needed in our district as they are working on their trunk plan, that highway 183 was one of those not on the trunk system that we talked about. David committed to me that the staff would be looking at 183 because it serves more than just Cuero to Austin. And as we looked at the map, we were able to see that the entire Gulf Coast and currently the highway running from Port Lavaca through Victoria through Cuero to San Antonio is on that trunk system. But we just need to connect the Gulf Coast area to the state capital and that is what 183 does and they committed to look at that. So, in making those comments, we have the report from Oberstar and I will certainly continue working with you as well.

Mr. **Hancock**. I have no questions. Thank you, Mr. Chairman.

Mr. **Laughlin**. Thank all of you very much for your time.

The next panel will be the economic development panel, Mr. Neil Amsler, President of Victoria Economic Development Council; John Fritz, Economic Development Representative of Gonzales County Electric Cooperative and Carl Hutchinson, President and Chief Executive Officer of Cyclean. Gentlemen, please come forward. Neill, I believe you are where you are supposed to be and when you are ready, if you will please proceed.

TESTIMONY OF NEILL AMSLER, PRESIDENT, VICTORIA ECONOMIC DEVELOPMENT COUNCIL; JOHN FRITZ, ECONOMIC DEVELOPMENT REPRESENTATIVE, GONZALES COUNTY ELECTRIC COOPERATIVE; AND CARL HUTCHINSON, PRESIDENT/CHIEF EXECUTIVE OFFICER, CYCLEAN

Mr. **Amsler**. Greg, I want to thank you for promoting me. I have not been able to get my group to do that.

Mr. **Laughlin**. Well, when I read that, I knew that was wrong. I am glad that Michael Hunter is not here, but sometimes things get typed wrong. We will not demote you unless you do a poor job here.

Mr. **Amsler**. Okay, I will try not to.

I would like to make a short statement first. South Texas is—due to a number of reasons, possibly going to be one of the parts of the country that realizes substantial growth in the near term future. The environmental laws—along the coast of the—the Gulf Coast, we have seen the petrochemical industry be a major driver of the coastal economies. The environmental laws that are coming down and judicial decisions that are coming down are creating a situation where, I think, that from Houston eastward growth is going to be significantly restricted in the coming years and the area from Houston southward is going to have an opportunity to grow at faster rates probably than we have seen in many, many years, maybe ever.

We also have a situation in the United States where labor is a problem. We are not growing in most areas of the country, our labor force is not, but in south Texas, we are going to have a continuous supply of labor, both from, you know, the growth of our existing population and immigration as well. So, I think we have an opportunity here to capitalize on and we have an infrastructure existing today which we are all talking about. I think we are hitting our problems and I am going to get into that too, but I think our existing infrastructure exceeds most areas of south Texas, if not all areas of south Texas. And, you know, with the trends that are occurring, combined with what we have got and what we hope we can get in the future, that we are starting to talk about here, I think, you know, we are going to see a tremendous amount of growth in this area.

We have had experts talk about highways already and the airport. I would like to say that with respect to the highways, the one link between Port Lavaca and Victoria on highway 87, I think that with the massive Formosa expansion going on down there and the growth that should occur in Calhoun County population wise as a result thereof, we need an escape route for those people in a storm situation.

We also need, for economic development reasons, an opportunity to capitalize on the downstream industries, the clean industries that we want in our municipalities of Port Lavaca and Victoria, in Edna and in Ganada and all of the towns around here. We want to see that happen. We need the four land divided highway to compete for this business. Most of these companies transport their products by trucks out and without those highways we are going to loose these competitions. So, you know, it is hard to prioritize which ones of these highways are the most important. They are all important, but in the short term, from a safety standpoint, I feel that the link between Port Lavaca and Victoria is a critical issue.

The airport situation that Pat Rhodes was talking about awhile ago; he was giving the specifics of the airport needs itself. As we know, we have a massive Chinese complex coming in here. We have the capacity right now to move people through our airport to Houston and the major airports of the world. We want to see a second airline in here that will tie to the hub in Dallas. We have got to have this new terminal in place, and the sooner the better, in order to compete for a second carrier. We expect, through the marketing of this organization, to see other countries of the world have their major corporations locate in here as we continue to internationalize the business community. So the airport is critical.

And the barge canal; I know Munson Smith is going to give you some details on that in a minute, but in a general sense, the deepening and widening of the barge canal to allow the industries to fully load the barges is going to be a continued enhancement to not only the profitability to our existing businesses, but our ability to attract new businesses. We have a company we have been working with for about a year now that is comparing the Mississippi River and Victoria for a major facility. They recently came out public on this thing. It has been in the press. It is a $350 million project with in the neighborhood of 300 to 350 jobs averaging 40,000 or better. That would be a tremendous diversification for this area and without this improvement on the barge canal, they tell us they will not even consider us. So expeditious funding and completion of this project is critical.

The Matagorda ship channel presently at 36 feet is a tremendous enhancement for the chemical industry in the area and it is probably deep enough to handle chemical shipping. But, if we are going to once again expand into other types of businesses, which we would like to do, especially as other areas of the country either run out of land, gets to expensive, the environment will not accommodate the industry, whatever, if we are going to compete for other types of businesses, we need to have at least 40 feet in that channel. This is a long-term project but it is something we need to be paying attention to and trying to get come about in the not to distant future.

Now two other problems. In this area we have—the City of Victoria is over an aquifer and I think that we are not going to have a problem for our population for a long time. On the other hand, the industry that we see in this area uses large quantities of water and we are projecting that in as little as 10 years, probably no more than 20 at the outside, we are going to be out of water for new industry. The only solution to that problem is the City of San Antonio solving its problems and thereby solving all of ours. That involves an area outside of the 14th Congressional District. But, you know, are we going to wait until San Antonio is forced into a solution or are we going to take a proactive view and solve south Texas' problems for water long-term? It is probably 30 years to get another dam built and filled and be able to sell water out of it. I can see that we have a 10 or 15 year gap where we are going to be in a real world of hurt selling new industry out in the not to distant future.

The last item is something that we are just beginning to pay attention to. It may be considered pie in the sky. Historically the Houston area and the New Orleans area has succeeded in locating dramatic numbers of small and medium size industries that have waste that would be considered—chemical wastes or other types of wastes that would be considered hazardous. They have located facilities that handle these wastes. The small and the medium size businesses do not generate enough of it. They do not have enough revenue stream to justify handling those waste themselves. If we can get in a facility to handle that, we are going to be able to compete for many, many projects that today we do not have the capacity to compete for.

I think that pretty well covers it gentlemen. Thank you.

Mr. LAUGHLIN. Thank you, Neil.

Mr. Chairman, at this time, I would ask unanimous consent to make a part of the record a letter for Harold Cobler, Transportation Committee Chairperson from the Victoria Chamber of Commerce.

The CHAIRMAN. No objection, so ordered.

Mr. LAUGHLIN. Thank you, Mr. Chairman.

John, if you will proceed.

[Mr. Amsler's prepared statement appears on p. 888.]

[Mr. Cobler's letter appears on p. 841.]

Mr. FRITZ. Thank you.

I would like to express my appreciation to the Honorable Chairman Anderson and Congressman Hancock and the Public Works and Transportation Committee of the United States House of Representatives and in particular our hard working congressman from the 14th District, the Honorable Greg Laughlin for the opportunity to appear before your committee on behalf of Gonzales County.

I am John Fritz, President of the Gonzales Area Development Corporation, a not for profit corporation founded in 1969 to further economic development in the Gonzales area. I am also employed by the Guadalupe Valley Electric Cooperative as their economic development representative serving the counties of Guadalupe, Gonzales, Lavaca and Wilson with electricity for home, farm and industry. We are very fortunate to have an abundant power supply at very reasonable costs and take great pride in our ability to provide reliable and efficient electric service.

I come before you to express a need for further assistance in our rural area. Specifically, we believe that money invested in public highway transportation in our area will pay economic dividends to the state and Federal Government in way of taxes that will come from economic prosperity.

According to Texas A&M Extension Service, Gonzales benefits from about 200 million dollars in cash receipts from agriculture annually. Almost 80 percent or about 157 million dollars comes from the poultry industry. Nationally recognized companies such as Tyson Foods, Cal-Maine Foods and Purina Mills, as well as some local producers, such as Holmes Foods and Kent Foods depend on railroad and highway transportation to carry on their commerce.

Indeed with the global opportunities that are proliferating today transportation is essential to their health. Mexico is on 220 miles away with the Maquiladoras serving as a gateway to trade opportunity. Victoria is a vital link that will be of increasing importance because of the port facilities. Austin, Texas is only 58 miles from us along highway 183.

As Bill Blackwell stated before, we also believe very strongly that the designation of Highway 183, as part of the Trunk System linking Austin, Texas and Interstate 35 to Victoria, Texas and Highway 59 will fill a void in linking Austin to the Gulf Coast for economic as well as safety purposes.

During times of emergency, such as seen in the past when a hurricane threatened the Gulf Coast, Highway 183 has been a preferred route for many people with Cuero, Gonzales, Lockhart and Luling as towns offering refuge and safety.

Next I would like to mention that several Gonzales industries are dependent to a great extent on rail traffic. I understand that this not a part of this committee but I wanted to go ahead and mention it anyway as I had it in my remarks.

Finally, I would like to thank you for your proposed assistance to the Gonzales Airport. Many local pilots, as well as visitors, have expressed a safety concern and that is the hump in the runway that makes you want to land when taking off and take off when landing.

Your help and assistance in these areas will be valuable tools we can use to ensure economic prosperity for our rural area. It was the help and far-sightedness of federal assistance that has made our country great. We in Gonzales accept the responsibility of work and follow through that comes from a boost from our government.

Thank you very much for your attention.

Mr. LAUGHLIN. Thank you, John.

Carl, if you will proceed at this time.

Mr. HUTCHINSON. Thank you, Greg.

Mr. Chairman, Congressman Laughlin and Congressman Hancock, I am the commercial break in this testimony. I will try not to make it sound like that.

There are over 500 million tons of asphalt that are laid in the United States every year on airport runways and highway systems. About four percent of that is recycled asphalt. There is a way to use 100 percent recycled asphalt pavement using microwave technology to do this in an environmentally clean manner. This presents a savings of 20 to 30 percent, which helps the budget crunch, particularly here in our State of Texas. It also presents a solution to the problem which faces the conflict of the ecology versus the economy, since this is environmentally sound. Example, in the City of Los Angeles, every day there are 1,000 tons of asphalt that are recycled, old asphalt taken off of their streets, which were going into their landfills.

In doing this—that is about 20,000 tons a month, that means that 20,000 tons of aggregate, old asphalt, does not have to go in a landfill in Los Angeles. To give you an idea of what 20,000 tons of asphalt is like, that is about the size of a four story building. That means that 20,000 tons of rock did not have to be quarried to make new asphalt. That saved 5,000 barrels of oil—this is every month, which is the difference between the amount of oil required to recycle old asphalt and the amount of oil required to make virgin asphalt. The kicker is the city saves over $100,000 a month and they have been doing this for three years.

The City of Austin is getting ready to do somewhat the same on a slightly smaller scale. Thanks to Mr. Oliver's help, we are working with District 18, which is a Texas district in Dallas. We are working with New York City and several other areas to help the situation. With 500 million tons of asphalt laid on our highways and airport runways every year, 20 to 30 percent savings in that would be considerable relief to our budgets.

There is already something in the national law which encourages recycling. The National Resource Recovery Act of 1976 states that—and I will paraphrase, if a commodity—if a government is using a virgin product and they can use a recycled product which is comparative quality-wise and price-wise with the virgin product, they must use the recycled product. That is not being done. There are two problems that prevent this from being done.

One is the bidding process itself that is restrictive in nature, with good understanding because of the history of recycled asphalt. By using microwave technology this can be done to turn old pavement back into new pavement and it is chemically and physically indistinguishable from virgin hot mix.

Thank you.

Mr. LAUGHLIN. Thank you, Carl.
